An engineering college in Cleveland, Ohio, founded in 1881. The student enrollment in the autumn of 1928 was 642, as compared with 538 in 1923, and practically the same number in 1913. The faculty increased from 45 members in 1913 to 60 in 1928, the library from 13,505 to 24,485 volumes, and the endowment from \$2,458,788 to \$4,040,315, the income for 1928 being \$357,109. The school received as a gift from Worcester R. Warner and Ambrose Swasey a student observatory equipped with an object glass of 10-inch aperture, two astronomical transits of 3- and 4-inch aperture, a 4-inch zenith telescope, a 2-inch theodolite, and two Riefler clocks. Professor Dayton C. Miller of the school devised a method of photographing sound waves, through which it was possible to make complete analysis up to 30 different components of any musical sound, and thus tell exactly what tones and overtones any musical instrument gives out; and so to compare any two musical sounds, as, for example, the notes of two pianos with each other, to determine which is the finer instrument. During 1926 gifts to the amount of \$1,670,000 were received, and a new mechanical engineering laboratory, to cost, with equipment, \$500,000, was begun, and in 1928 a mechanics and hydraulics laboratory, costing about \$155,000, was finished. President, Charles Sumner Howe, Ph.D., D.Sc., LL.D.

**CASIMIRI, RAFFAÈLE CASIMIRO** (1880- ). A noted Italian composer and musicologist, born at Gualdo Tadino, Umbria. He received his musical education from L. Bottazzo in Padua and began his career as editor of *Rassegna Gregoriana* in Rome in 1901. After several years' activity as *maestro di cappella* in various seminaries and churches in Teano, Capua, Perugia, and Vercelli, he was called, in 1911, in the same capacity to San Giovanni in Laterano in Rome. In 1922 he founded the Società Polifonica Romana, a chorus of 60 trained singers, which he brought to such perfection that he undertook extended concert tours, through Europe, and, in 1927, also visited the United States. Besides contributing in a practical manner toward reviving interest in the older *cappella* music, he published the results of original researches in various periodicals and books. Of the latter, the more important are *G. P. da Palestrina: Nuovi documenti biografici* (1918 and 1922), *Nuove ricerche sul Palestrina* (1923), *La rinascita della musica sacra nel*

*secolo XVI* (1924). His compositions include two oratorios, *San Pancrazio* and *Santo Stefano*; *Madrigali e Scherzi* for mixed chorus; numerous litanies, offertories, motets, and several masses.

**CASSEL**, kās'sel, GUSTAV (1866- ). A Swedish economist and student of mathematics who studied at Stockholm and abroad. Early in his career he instructed in national economy at the high school in Stockholm, and about the same time published *Das Recht auf den vollen Arbeitsertrag* (1900), and *The Nature and Necessity of Interest* (1903). Many times after 1905, he was identified with state financial matters in Sweden. In 1921 he was one of the Swedish representatives at the London meeting of the International Chamber of Commerce, and in 1922 he was a member of the international commission to stabilize the German mark. He published *The Theory of Social Economy* (1918, Eng. trans. 1923), and his *Memorandum on the World's Monetary Problems* was published by the League of Nations for the International Financial Conference in Brussels in 1920. Other works include *Germany's Economic Power of Resistance* (1916); *The World's Monetary Problems* (1921); *Money and Foreign Exchange After 1914* (1922); *Fundamental Thoughts in Economics*, lectures delivered at the University of London (1925); *Recent Monopolistic Tendencies in Industry and Trade* (1927); *Foreign Investments* (1928), and *Post-War Monetary Stabilization* (1928).

**CASSIRER**, kās'se-rār, ERNST (1874- ). A German philosopher of the neo-Kantian school (see VOL IV). His work has been made available in English through the translation of *Substanz und Funktion*, to which has been added in the same volume some chapters on Einstein's theory of relativity. His more recent works include *Freiheit und Form* (1918), *Heinrich von Kleist und die Kantische Philosophie* (1917), and *Zur Einstein'schen Relativitätstheorie* (1921). The English translation of *Substanz und Funktion* and *Einstein's Theory of Relativity*. Professor Cassirer edited a new edition of Kant's works in 11 volumes, and wrote the concluding biographical volume (1912-18). Among his latest works are *Philosophie der symbolischen Formen* (1923), *Sprache und Mythos* (1925), *Individuum und Kosmos in der Philosophie der Renaissance* (1927). Since 1919 he has been at the University of Hamburg.

**CASTELLANI**, ALDO (1875- ). An Italo-British physician, authority on tropical medicine, born at Florence and educated at the Universities of Florence (M.D., 1899), Bonn, and the London School of Tropical Medicine. His earlier years of practice were occupied in part by the study of tropical diseases, notably African sleeping sickness and yaws. In this research, he represented in part a special commission from the Royal Society of England. He was professor of tropical medicine at the Ceylon Medical College (1903-15), and at the Royal University of Naples (1915-19). Since 1919 he has been visiting lecturer at the London School of Tropical Medicine and director of tropical medicine for the Ross Institute. On the outbreak of the World War, he was made a lieutenant colonel of the Royal Italian Medical Service. In 1926 he became professor of tropical medicine at Tulane University, New Orleans. He is best known by his exhaustive work, written

in collaboration (Castellani and Chalmers), *A Manual of Tropical Medicine* (1910, 4th ed. 1923). In 1927 appeared *Fungi of Fungal Diseases*.

**CASTELNAU**, kās'tel-nō', EDOUARD VICOMTE DE CURIÈRES DE (1851- ). A French general, who was educated at Saint-Cyr and the École de Guerre. He served in the Franco-Prussian War, in Cochinchina and Algeria, before the World War, was a member of the Superior War Council, and in 1914 was in command of the 2d French Army. He early distinguished himself as the "Savior of Nancy" with the result that in December, 1915, he was made chief of the general staff. In this capacity, he went to Greece and helped plan the defenses of Saloniki, and in 1916, he aided in the defense of Verdun. Early in 1917, he was sent on a mission to Russia, and on his return he commanded the armies of the East, until the close of the war. A remarkable soldier, it was said that only political enmities prevented his rise to the highest military post France had at her disposal. A nationalist and member of the Bloc National, he was elected to the Chamber of Deputies in 1919, and later became a Senator. He was president of the Liges des Patriotes (1923- ) and of the Fédération Nationale Catholique. Consult *Le Général de Castelnau* by V. Giraud (1921).

**CASTLE**, EGERTON (1858-1920). An English novelist (see VOL IV). His later novels, written for the most part in collaboration with his wife, Agnes Castle, include: *The Ways of Miss Barbara* (1914); *The Hope of the House* (1915); *The Black Office* (1917); *Wolf Lure* (1917); *Minniglen* (1918); *New Wine* (1919); *Little Hours in Great Days* (1919); *John Seneschal's Margaret* (1920).

**CASTRO**, MATILDE (1879- ). An American educator born in Chicago. She was educated at the University of Chicago and taught philosophy as a member of the faculties of Mount Holyoke College, Vassar College, and Rockford College. In 1913, she was called to Bryn Mawr as director of the model school and professor of education. In 1923 she was married to Dean James H. Tufts of the University of Chicago. She is the author of *The Respective Standpoints of Psychology and Logic* (1913).

**CATALAN MOVEMENT**. See SPAIN, under *History*.

**CATALYSIS, CATALYSTS**. See CHEMISTRY; and CHEMISTRY, APPLIED.

**CATERPILLAR TRACTOR**. See TRACTOR.

**CATHER**, WILLA SIBERT (1876- ). An American author born at Winchester, Va. She was educated at the University of Nebraska, and shortly after her graduation went into journalistic work. In 1906-12, she was associate editor of *McClure's Magazine*. Miss Cather is a writer who deals simply and profoundly with the problems of life, presenting them in a direct style. She received the degree of Litt.D. from Yale University in 1929. Among her works are *April Twilight* (1903), a book of verse; *The Troll Garden* (1905), which attracted considerable attention; *Alexander's Bridge* (1912); *The Bohemian Girl* (1912); *O Pioneers* (1913); *The Song of the Lark* (1915); *My Antonia* (1918); *Youth and the Bright Medusa* (1920); *One of Ours* (1922); *A Lost Lady* (1923); *The Professor's House* (1925); *My Mortal Enemy* (1926); and *Death Comes for the*

*Archbishop* (1927). *One of Ours* won the Pulitzer Prize as the best novel published in 1922.

**CATHOLIC CHURCH.** See ROMAN CATHOLIC CHURCH.

**CATHOLIC UNIVERSITY OF AMERICA.** An institution of higher learning located at Washington, D. C.; established in 1887 by the Hierarchy of the United States. It includes the schools of theology, canon law, law, philosophy, letters, and sciences; graduate schools of sciences, law, and philosophy; and affiliated with it are the Catholic Sisters for the training of teachers, Trinity College for young women, and the houses of study of 20 religious orders. The student body in the university proper in the autumn of 1928 numbered 893, the faculty 113 members, and the library contained 273,000 volumes. The summer session of 1928 had an enrollment of 742. The productive funds amounted to \$2,648,778 and the income for the year to \$748,671. An important advance in the way of organization occurred in 1923 with the establishment of the School of Canon Law; and in the way of equipment, in the construction of the Martin Maloney Chemical Laboratory. A gymnasium was constructed with floor space of 44,000 square feet, and a stadium was started in 1924. Toward the construction and equipment of the John K. Mullen Memorial Library, begun in 1925, additional sums of money were contributed by Mr. Mullen of Denver, Colo., in subsequent years. The Hierarchy of the United States also contributed various sums of money toward the construction of a home for ecclesiastical professors. Periodical publications of the university were: *The Catholic Educational Review*; *The Catholic Historical Review*; *The Catholic Charities Review*; and the *Corpus Scriptorum Orientalium*. Rector of the University, Monsignor James H. Ryan, Ph.D., S.T.D., who succeeded the Rt. Rev. Thomas J. Shahan, S.T.D., J.U.L., LL.D. Titular Bishop of Germanicopolis, in 1928.

**CATT, CARRIE CHAPMAN** (1859- ). An American suffrage leader (see VOL. IV). In 1920 she had the pleasure of seeing the work of a lifetime crowned with success when the women of America went to the presidential polls for the first time. In June, 1920, she was reelected president of the International Woman Suffrage Alliance, and in 1923 she was made honorary president on her announcement that thereafter all her activities were to be devoted to the newly formed Pan-American Union. Her extensive travels during the years 1920-24, in Europe and South America, influenced greatly the progress of woman suffrage.

**CATTELL, J(AMES) MCKEEN** (1860- ). Psychologist and educator (see VOL. IV). He was dismissed from Columbia University under war conditions (1917), but in the course of a legal battle with the university was able to recover the amount of his pension. In 1919 he published a volume attacking the administration of the Carnegie pensions for university professors. Retired from active teaching, he continued his educational work as editor of *The Scientific Monthly*, *School and Society*, and *Science and Education*. He published his fourth edition of *American Men of Science* in 1927. He was president of the American Association for the Advancement of Science in 1924 and in 1929 was president of the International Psychological Congress at New Haven.

**CATTLE.** See DAIRYING; LIVE STOCK; VETERINARY MEDICINE.

**CAVALRY.** See ARMIES AND ARMY ORGANIZATION; STRATEGY AND TACTICS.

**CAVE, GEORGE, VISCOUNT** (1856-1928). An English jurist, born in London. He was educated at St. John's College, Oxford, and began the practice of law in 1880. He was a member of Parliament from 1906 to 1918, when he was created a viscount. Among the many important posts he filled were those of standing counsel of Oxford University (1913-1915); attorney general to the Prince of Wales (1914-15); Solicitor General (1915-16); Home Secretary (1916-1920); and a Lord of Appeal (1919-20). He was chairman of the Southern Rhodesia Commission (1919-20), of the Munitions Inquiry Tribunal (1921), and of the Committee on Trade Boards (1921-22). He was Chancellor of Oxford University from 1925-28. In the Baldwin cabinets, he was Lord Chancellor from Oct. 25, 1922, to Jan. 21, 1924, and from Nov. 4, 1924, until his resignation on Mar. 28, 1928, the day before his death. On the same day, his advancement to an earldom was announced. For a short time in 1927, he was acting Prime Minister. He edited several legal treatises.

**CAVELL, EDITH** (1865-1915). A British nurse born at Swardston, Norfolk. She was educated in England and Belgium and in 1895 entered a London hospital as probationer. She held various positions as superintendent and matron, and in 1907 was appointed the first matron of the Berkendael Medical Institute at Brussels. During the World War, the institute became a Red Cross hospital. On August 5, 1915, Miss Cavell was arrested by German officers on the charge of having assisted British, French, and Belgian soldiers to escape from Belgium. She admitted the charge and was sentenced to be shot on October 11. An unsuccessful appeal for postponement of the execution was made by Brand Whitlock and the Marquis de Villalobar, American and Spanish Ministers in Brussels, respectively. The German surgeon and the priest who were present at the execution both stated that she was killed by the volley of the firing squad. The circumstances of the execution provoked widespread indignation and Miss Cavell was regarded as a martyr not only in England but in other countries. A memorial service at Westminster Abbey, attended by Premier Asquith and representatives of the royal family, was attended by a vast multitude. A statue, by Sir G. Frampton, was erected to her memory opposite the National Portrait Gallery, London. In 1928 the controversy as to the manner of her execution was renewed by the appearance of the British film *Dawn*, in which, at the scene of the execution, Miss Cavell was represented as fainting after the shooting of a soldier who refused to fire. She was not killed by the volley of the firing squad, according to the film, but was shot by the officer who then killed himself. The German government protested against this presentation of the execution, and Sir Austen Chamberlain, the British Foreign Secretary, opposed the exhibition of *Dawn* in England. The literature about her includes *A Noble Woman*, by Ernest Protheroe (1916); *The Case of Miss Cavell; from the unpublished documents of the trial: the property of a commissary of the German government*; interpreted by Ambrose

Got (1920), and *With Edith Cavell in Belgium*, by Jacqueline Van Til (1922).

**CAWTHORN, JOSEPH (BRIDGER)** (1869- ). An American actor born in New York City. He was educated at home by his mother and appeared on the stage as a child in Robinson's Music Hall, New York, in 1871, then with Haverly's Minstrels. He was taken to England at the age of nine, and was comedian in several musical plays. In 1910 he appeared as Oscar Spiel in *Girlies* at the New Amsterdam Theatre, New York. This was followed by his appearance as Louis von Schloppenhauer in *The Slim Princess* in 1911. He played in *Sybil* during 1916-17, in *Rambler Rose* in 1918, and as Timothy in *The Canary* during 1919-20. He also took the part of the Hon. Hudson Hobson in *The Half-Moon* in 1920. In 1926 he went into moving pictures.

**CECIL, sēs'ūl or sīs'ŭl (EDGAR ALGERNON) ROBERT, FIRST VISCOUNT OF CHELWOOD** (1864- ). An English statesman, third son of the Marquis of Salisbury. He was educated at Eton and University College, Oxford, and read for the bar. After two years as private secretary to his father (1886-88), he devoted himself to the law until 1906, when he was elected to Parliament as a Conservative. He fought against disestablishment, social legislation, and tariff reform, and it was the last issue that brought on his defeat in 1910. He was reelected in 1911 and sat after that for the Hitchin division, Hertfordshire, until 1923 when he was created Viscount Cecil of Chelwood. During the World War, he displayed his great abilities in the difficult offices of Parliamentary Under-Secretary for Foreign Affairs (1915-16), Minister of Blockade (1916-18), and Assistant Secretary of State for Foreign affairs (1918). His subsequent career took on something of the nature of a crusade. He early became convinced of the necessity for some such instrument as the League of Nations to preserve international peace and together with General Smuts, among the British, threw himself wholeheartedly into the movement. With Smuts, he was British representative on the League of Nations' Commission, and it was as a result of Smuts's intercession that South Africa tendered him her seat in the League Assembly, when Lloyd George passed him over. He continued on the Assembly for South Africa into 1923. In April, 1923, he came to the United States in the interests of the League. As the head of the League of Nations Union, he worked untiringly in the interest of universal peace. In 1923 he entered the short-lived Baldwin cabinet with the portfolio of Lord Privy Seal. From 1924 to 1929, he was Chancellor of the Duchy of Lancaster in the second Baldwin government. He was an ardent believer in disarmament and represented Great Britain on the League Preparatory Commission for Disarmament and at the tri-power naval Disarmament Conference at Geneva in 1927. He loyally followed the cabinet instructions, but, when the Conference ended as a failure, he claimed that if the Government had really desired a successful outcome it could have been achieved. Because he could no longer endorse the foreign policy of his government, he resigned. He wrote *Conservatism and Peace* (1928) and *The Way of Peace*, a selection from his writings and speeches (1928), and was joint author of *Principles of Commercial Law and Our National Church*.

**CECIL, RT. HON. LORD HUGH (RICHARD HEATHCOTE)** (1869- ). An English politician, fifth son of the Marquis of Salisbury. He received his education at Eton and University College, Oxford, and for a time was a Fellow of Hertford. He entered politics in 1895 as a Conservative and served in Parliament continuously to 1906. He was among the young Conservatives to take a stand against Chamberlain's tariff programme, and as such, gained an excellent reputation. He was defeated in 1906 and not returned again until he was sent up by Oxford in 1910, a seat he held from that time on. In 1921 he followed his brother, Lord Robert (q.v.), in the break from Lloyd George. A brilliant orator, he was the spokesman of the High Church Party in the House of Commons. His book *Conservatism* was the best expression of the philosophical implications of the doctrine in his generation.

**CEMENT.** An important development since the World War has been the larger use of concrete for many forms of construction of widely different types. This naturally has led to an increased demand for cement, and with it came various improvements in the scientific proportioning of the constituents and control over the manufacturing processes so as to obtain a uniform and standard material of carefully specified characteristics. In the United States, Portland cement makes up the bulk of the cement output. It is manufactured by calcining to incipient vitrefaction a mixture of limestone and clay marl, or blast-furnace slag, in the approximate proportions of one part of clay or shale to three of limestone. In the United States, 125 plants were engaged in the production of cement in 1921, according to the census of manufactures for that year. In 1928 the number of plants so engaged had increased to 160 according to an estimate by *Rock Products*. Machinery is extensively used in the preparation, handling, and packing of the material and consequently the industry gives employment to a relatively small number. According to *Rock Products*, 36,292 wage earners produced 173,206,513 barrels of Portland cement with an estimated production of 1.6 barrels per man-hour. The consumption of fuel and power is unusually heavy and, from the standpoint of power demand, the Portland cement industry ranks among the first ten manufacturing industries.

The value of Portland cement shipments in 1928 in the United States was \$275,885,902, as compared with \$278,854,047 in 1927, though the tonnage output in 1928 was slightly greater than in 1927. The average factory price per barrel in 1928 was \$1.52 according to *Rock Products*. The cement industry is well distributed throughout the country. The most important area of production is Eastern Pennsylvania, in the Lehigh district, where is found a valuable raw material known as cement rock. This region is not only the greatest producer but has the largest number of plants, and is followed in order of importance by California and a district comprising Illinois, Indiana, and Michigan. The general tendency in cement manufacturing has been to install large plant units and to exercise greater care in the process

of manufacture. New plants continue to be built though the industry in 1929 was operating at only about 75 per cent of capacity. More economical utilization of waste steam has reduced production costs in many plants.

The production of Portland cement in the United States in 1928 was 176,195,488 barrels from 156 plants as compared with 173,206,513 barrels from 153 plants in 1927. The production of masonry, natural, and puzzolan cements in the United States in 1928, as reported by the U.S. Bureau of Mines, was 2,210,404 barrels, valued at \$2,910,097.

Cement manufacturing in Europe was naturally interfered with by the World War, but was gradually resumed as the reconstruction progressed. France was a leader in this respect, not only using considerable amounts of cement in her own reconstruction work, but she also was able to restore the markets of the other countries. In Belgium, the annual pre-war output was gradually approached again as conditions returned to normality. In England, the industry suffered considerably after the War on account of high coal and labor costs and the large amount of foreign imports. In Germany, activity was restricted after the War, and the loss of coal fields and the consequent necessity of importing fuel restricted production, though in Westphalia pre-war conditions had been reached by 1922. Subsequent to the War, a cement industry was established in China; Japan was already productive.

Besides Portland cement, higher alumina cements were developed in France and latterly in the United States. These cements, while they do not set more rapidly, show a greater strength after 24 hours than that of Portland cement after 28 days. A greater resistance to the chemical attacks of sea water and sulphate-bearing ground waters was also claimed for them. Alumina cement was more costly, as high-grade aluminium ore, such as bauxite, was largely required in the manufacture.

The method of using alumina cement is

#### PORTLAND CEMENT PRODUCED IN THE UNITED STATES, 1917-1928, IN BARRELS

According to U. S. Bureau of Mines (1928 estimate by Rock Products)

1917	92,814,202
1918	71,081,663
1919	80,777,935
1920	100,023,245
1921	98,842,049
1922	114,789,984
1923	137,460,238
1924	149,358,109
1925	161,658,901
1926	164,520,163
1927	173,206,513
1928	175,968,000

much the same as that for Portland cement, except that wetter mixtures are used, and it must be used alone, not mixed with Portland cement. The cement, though not quick in setting, so

that ample time must be afforded for mixing, setting, transporting, and placing, nevertheless develops very rapidly, after setting, the high strength which is its principal advantage. During the War, alumina cement was used by the French Army in the construction of concrete foundations for big guns which were ready for operation within 24 hours. To offset its higher cost, alumina cement possesses or was thought to possess many superior properties.

#### APPARENT CONSUMPTION OF PORTLAND CEMENT

	Barrels	Value
1922	116,897,194	\$204,593,075
1923	136,589,066	257,704,348
1924	147,192,069	264,571,342
1925	159,943,073	281,357,462
1926	164,456,987	280,122,525
1927	173,098,182	279,014,381
1928	176,913,695	268,307,281

**CENSUS.** The Fourteenth Decennial Census of the United States was taken as of Jan. 1, 1920. It covered population, agriculture, manufactures, forestry and forest products, and mines and quarries. Over 90,000 enumerators were employed to collect the data in regard to population and agriculture. The enumerators worked under the supervision of 372 district supervisors who were appointed especially for this task. The results of the Fourteenth Census, as published, comprised 13 quarto volumes—four on population, four on agriculture, three on manufactures, one on irrigation and drainage, and one on mines and quarries—in all, over 12,000 pages of printed matter consisting mainly of statistical tables.

The Fifteenth Decennial Census was provided for by the Act of June 18, 1929, to be taken as of Apr. 1, 1930, and to include all the subjects covered by the previous census and also the subject of distribution, or wholesale and retail trade, and unemployment. This act is the first since 1850 to combine the census and congressional apportionment. The personnel required for this Fifteenth Census was estimated at over 100,000 enumerators and about 550 supervisors. The actual period of enumeration was planned, as a rule, not to extend beyond two weeks in cities and one month in country districts. The population census reports the sex, color, age, marital status (whether single, married, widowed, or divorced), nativity, and occupation of each person. It also carries questions as to school attendance, and whether able to read and write, and to speak English; and in the case of the foreign-born, it asks whether naturalized or alien and the year of immigration to the United States. The population census of 1930, as required by law, was to include also two or three more questions in regard to unemployment.

The agricultural schedule carries questions as to acreage, tenure, value of farms, farm implements or machinery, different classes of live stock, crops raised, etc. In all, there probably will be about 350 questions on the agricultural schedule and 25 or 30 on the population schedule.

#### SUPPLIES OF PORTLAND CEMENT IN THE UNITED STATES 1922-1928

Year	Domestic shipments		Imports		Exports	
	Barrels	Value	Barrels	Value	Barrels	Value
1922	117,701,216	\$207,170,430	323,823	\$ 628,846	1,127,845	\$3,206,201
1923	135,912,118	257,648,424	1,678,636	2,964,098	1,001,688	2,944,174
1924	146,047,549	264,046,708	2,023,663	3,139,788	878,543	2,615,154

1928	175,455,000	268,125,000	2,283,351	3,120,983	824,656	2,938,702

The census of manufactures, which is now taken every two years, covers quantity and value of products; number of employees; amounts paid for wages; salaries, materials, and contract work; horse power; coal used; and other facts regarding the industries of the United States.

Under the law of 1929, a period of three years—known as the census period—is allowed for the completion of the census. That is none too much time for inspecting and coding the schedules, punching the cards, making various runs through the electric tabulating machines, preparing the copy for the printer, and publishing the results. This is the first census law to provide that the results of the census shall be sent to Congress by a specified time.

The decennial censuses, although of great magnitude, are only a part of the many activities of the Bureau. The Bureau operates at full speed at all times. It collects and publishes yearly statistics concerning births and deaths; financial statistics of States and cities; marriage and divorce; and forest products, including the production of lumber, lath, shingles, wood pulp, and the consumption of pulpwood. Quinquennially, the Bureau takes a census of electrical industries, including electric railways, telegraphs, telephones, and central electric light and power stations. The census of agriculture has now been made quinquennial, since the law provides that such a census shall regularly be taken in the fifth year following the decennial census. Commencing in 1921, a census of manufactures has been taken every two years. Such a census had previously been taken at five-year intervals. Decennially, but not always during the three-year regular decennial census periods, the Bureau publishes life tables; information relating to institutional population, that is, prisoners and juvenile delinquents, insane in hospitals, feeble-minded and epileptics, paupers in almshouses; religious bodies; transportation by water; and wealth, debt, and taxation.

The Bureau issues the *Monthly Survey of Current Business* containing important current statistics on domestic, industrial, and commercial movements. It collects and publishes also, either semi-monthly, monthly, quarterly, or semi-annually, statistics of production, stocks, and consumption, covering various key commodities, such as cotton; hides, skins, and leather; boots and shoes; clothing; hosiery; wool consumption and stocks; tobacco; sugar; etc. For the use of various interested organizations, it has made annual estimates from time to time, between the decennial announcements of the population of States, counties, and cities, for use during intercensal years. At two-year intervals, the Bureau issues an Official Register or directory of persons in the service of the United States, exclusive of the Army and Navy.

**CENTRAL AMERICAN UNION.** A plan proposed in 1917 for a federal republic, which after preliminary negotiations failed in 1922. Later in that year at the suggestion of the President of Nicaragua, who was known to be under the influence of Washington, a conference was held on board the United States cruiser, *Tacoma*, in Fonseca Bay. It was attended by the presidents and cabinets of Nicaragua, Honduras, and Salvador, and by the United States ministers to those countries. It renewed some of the features of the 1907 treaty, which had been practically rendered ineffective by Nicaragua's refusal, with Wash-

ington's support, to accept the decree of the Central American Court relative to Fonseca Bay, although Guatemala and Costa Rica refused to adhere to the *Tacoma* agreement on the grounds that the Treaty of 1907 was still in force. This conference also led, in October, 1922, to the calling by Secretary Hughes of a further conference of the five republics to meet in Washington for the purpose of reinforcing the 1907 pact and other matters. The sittings commenced on Dec. 4, 1922, and ended on Feb. 7, 1923. The plan of a Central American Union was voted down by Guatemala, Nicaragua, and Costa Rica, but a treaty of peace and amity to supplement the treaty of 1907 was signed, as well as 14 conventions relating to a Central American tribunal, international commissions of inquiry, limitation of military, naval, and air forces and armaments, free trade (Costa Rica dissenting), etc. Unfortunately, the treaty contained no guarantees against war and was hardly considered by Central Americans an adequate substitute for a federal union.

**CENTRAL STATIONS.** See ELECTRIC POWER STATIONS AND GENERATING APPARATUS; POWER PLANTS, STEAM ENGINES AND TURBINES.

**CENTRAL UNIVERSITY OF KENTUCKY:** See CENTRE COLLEGE.

**CENTRE COLLEGE.** An institution for the higher education of men at Danville, Ky., founded in 1819. The student enrollment increased from 107 in 1914 to 333 in 1927-28; the faculty increased from 18 in 1923 to 28 in 1928; the endowment, which in 1914 amounted to \$380,000, aggregated \$1,249,106 in 1928; the total income from all sources for the year 1927-28 was \$127,401 and plant assets in 1928 were \$501,762, bringing the total assets up to \$1,750,868. The library, which had 30,000 volumes in 1923, had 31,711 in 1928. In 1918 the name of the institution was changed from Central University of Kentucky, which it had been called since 1901, to its original name, Centre College, and in 1926 the Kentucky College for Women was taken over by Centre College and conducted as the Woman's Department of Centre College, a coördinate institution. In 1923 a stadium seating 8500 people was added to the equipment of the college. President, Charles J. Turck, A.M., LL.D.

**CÉSPEDES,** thás-pá-dás, CARLOS MANUEL DE (1871- ). A Cuban diplomat, son of the first President of Cuba, born in New York City and educated in the United States, France, and Germany. He was governor of the Province of Santiago de Cuba (1895-98), and from that time on was active in the affairs of Cuba, favoring liberal measures. He was vice president of the House of Representatives (1902-08), represented Cuba in Italy, Greece, and Argentina, successively (1909-14), and was Envoy Extraordinary and Minister Plenipotentiary to the United States (1914-22). He became Secretary of State in 1922 and on Nov. 17, 1926, resigned, and went to Paris as minister.

**CEYLON,** sê-lôn'. An island and British Crown colony situated in the Indian Ocean off the coast of Hindustan. In 1921 its resident population was 4,497,854, an increase of 9.6 per cent over the last decennial census. Of these, the Europeans totaled 8099 (8524 in 1911); Burghers, 29,403 (26,673 in 1911); Singhalese, 3,015,970; Tamils, 1,119,699; "Moors," 284,848, others 26,440. The non-resident population, i.e., military, shipping, etc., was 6696.

The estimated population in 1927 was 5,124,992. The principal towns had the following populations in 1921: Colombo, 244,000 (213,396 in 1911); Galle, 39,100 (40,187 in 1911); Jaffna, 42,400; Kandy, 32,000. Agriculture continues as the leading activity, 3,000,000 acres out of the total 10,212,400 acres being under cultivation in 1922. In 1925 the distribution was as follows: paddy, 834,000 acres; other grain, 104,000 acres; cacao, 35,000 acres; cinnamon, 25,000 acres; tea 442,000 acres; coconuts, 883,000 acres; rubber, 475,000 acres (215,000 in 1911). In 1928 export of tea totaled 217,000,000 pounds (186,594,000 pounds in 1911); the export of rubber, 131,840,500 pounds, of which 81,625,400 pounds went to the United States. The commercial record shows a continual improvement, in 1926 the imports being worth £28,075,198 and the exports (including re-exports) £29,951,583, as against £13,309,386 and £15,657,570 for 1913. Principal exports in 1927 were: Copra, £2,122,988; coconut oil, £1,104,518; tea, £14,246,123; coconuts, £601,006 desiccated £1,365,451; rubber, £8,650,509. The principal imports included cotton goods, rice, coal and coke, and sugar. In 1927 total tonnage entered and cleared was 21,394 tons (14,926,764 in 1911) of which 13,152,000 tons were British (9,571,159 in 1911). In the same year, 851 miles of railway were open. For 1926-27 the budget contained the charges: for revenue, £8,623,928; for expenditures, £8,069,753. The public debt at the end of 1926 amounted to £12,657,393 sterling and 3,000,000 rupees. By an Order in Council of December, 1923, certain changes in Ceylon's administrative machinery were effected. The size of the legislative council was increased, the unofficial members being placed in the majority.

**CHAFEE, ZECARIAH, JR.** (1885- ). An American law professor, born at Providence, R. I. He was educated at Brown University and the Harvard Law School and for a time engaged in the private practice of law. In 1916 he went to the Harvard Law School where he was made a professor in 1919. He was among the first to protest against the violation of the constitutional liberties of American citizens in the years following the World War. In company with Dean Pound and Felix Frankfurter of the Harvard Law faculty, among others, he helped evolve a sociological point of view toward the law. He was chairman of the Committee on Coal and Civil Liberties reporting to the U. S. Coal Commission in 1923. He wrote: *Cases on Negotiable Instruments* (1919); *Freedom of Speech* (1920); *Cases on Equitable Relief against Torts* (1924), and *The Inquiring Mind* (1928).

**CHAIN STORES.** By "chain" stores are meant groups of retail establishments which are operated under a common management and ownership. They may be "branches" of a large parent institution, or they may be establishments of substantially the same size, none of them much superior to any of the others, and all of them operated from a management office at headquarters. These "units" may, when required, be organized as independent corporations whose stock is then held by the management company (as in the case of banks), or they may be simply retail establishments which are actually owned and directly operated by the management concern without the intervention of a stock or corporate organization in any form.

**Origin and Scope.** Chain-store operation in some form has been carried on in the United States for quite a while. The Great Atlantic & Pacific Tea Co. dates from 1859, the Jones Tea Co., from 1872. The F. W. Woolworth Co., was organized in 1879, the James Butler enterprise in 1882, while among the more recent were S. S. Kresge Co., which, however, takes its rise from 1897, the United Cigar Stores, which dates from 1900, and the J. C. Penney Co., from 1902. Great difference of scope, however, exists among the different chains. Some of them assert that they have a unit in every considerable town in the United States and are thus "national," while others operate in certain groups of States or localities. It is probable that at the present time several chains have units numbering upward of 1000, while the organization of new stores is going on very rapidly. Of late years, there has been a tendency for the larger chain organizations to go into the wholesaling, and in some cases into the manufacturing business, thus creating an unbroken series of distributive units extending from producer straight through to consumer. Simultaneous with this development, there has been a tendency to extend the chain method into a considerable number of new fields. It is best established today in groceries, drugs, cigars and tobacco, and dry goods and clothing, but it is also expanding into the fields of candy, bakeries, restaurants, banking, hotels, and music. In all, 55 different fields are now partly or largely occupied. The total amount of merchandise dispensed by chain stores is variously estimated, but the total turnover is probably not less than \$2,900,000,000 per annum for 51 principal chains.

**Reason for Chain-store Development.** The reason for chain-store development as distinct from individual store growth is variously set forth, but the most important consideration is undoubtedly found in the high cost of retailing and consequent high prices for goods. It is estimated by the best authorities that the individual business man today must set aside about 40 per cent of every dollar which he receives in actual sales to cover his overhead and distributing charges. That is, today, if he is obliged to pay more than 60 cents out of every dollar for the goods he gets, he will be unable to make ends meet in the long run. The chain store was originally an effort to cut the cost of retailing, and by furnishing goods at lower prices to extend the scope of sales and increase the turnover. In accomplishing this object, analysis was first made of the different elements entering into retail prices. They were found to be chiefly (1) cost of goods laid down in the establishment, (2) wages, rent, carrying charges, and depreciation, (3) losses and expense through the extension of credit to customers, (4) cost of delivery, and (5) advertising. Most chain stores have worked on the idea of eliminating so far as possible all of these charges beyond the original cost of goods except a minimum personnel and rent charge. The wage item it has been endeavored to hold to the lowest possible figure by reducing the operations of the store to a routine basis, more or less easily covered by standard instructions, and thus eliminating the necessity of very high-cost personnel at the various units.

In these ways, it has been hoped to give chain stores a competitive advantage over retail stores conducted and owned by an individual or local

corporation and hence to enable the elimination of these units by the pressure of competition.

**Success of Chain Store.** In the beginning of the movement, and particularly during the years of early and rapid development after 1900, chain stores adhered quite closely to their original principles. They sold comparatively few articles, but they sold them for cash and insisted that the buyers take them away on the "cash-and-carry" plan. They rarely, if ever, extended credit, and since the articles which they retailed were for the most part not very perishable, their losses were small. The profit per unit of goods sold was small, but large turnover was relied on to make up for such limitation of the margin of earnings. In this way prices were set at figures sometimes as much as 20 per cent lower than those charged at independent establishments.

As time has gone on, the pressure to extend credit and make delivery has been strong, and some chains now set themselves forth as furnishing both types of accommodation, although others adhere to the earlier plan. As they have successively added the older elements of service which led to high cost, their costs have accordingly tended to approximate those of the independent store. An investigation carefully made in the spring of 1920 embracing a large number of stores in New York City showed only a small margin of price advantage in favor of chain stores, as compared with independent establishments. However, the number of chain stores has tended to increase with great rapidity, so that in many towns in the West and South, they have entirely superseded other stores in the grocery and cigar business, and have made decided inroads into the field in other lines. So successful have they been, that the chain store movement has now spread to other countries, and has taken some root in Great Britain and Ireland, Germany, and other continental countries.

**Study of Retailing.** The chain store has, however, obtained a very decided permanent advantage over the retail establishment, in the fact that it has made a careful comparative study of retailing and distributing costs which it is able to standardize and keep up to date. By standardizing commodities, it has succeeded in putting upon the markets products which are recognized as of satisfactory quality, but which can be produced much more cheaply than could the multifarious competing products which were originally sold by independent establishments. "Private brands" also have been used to advantage in place of patented articles. By producing these articles on the large scale, it has been found practicable to eliminate many items of competitive expense and actually to bring the goods to the consumer at a very much narrower cost than formerly. Since in many cases the independent storekeeper has been able to take advantage of these generally lowered costs for standardized articles, he has in turn been able to compete and to remain in business, while the consumer has profited from the lower prices all around. The chain store, however, has naturally retained its advance, or "lead," and in many communities is recognized as setting the pace for the independent establishments. Its great advantage thus comes from constant careful analysis of retail expenses and of changing popular tastes, as well as, it should be added, from its ability to create new demands

and tastes by offering the consumer articles which he prefers to those to which he has been accustomed or items that lead him to broaden his consumption in a way that otherwise would not have been expected.

The chain store also has made great advances in studying the psychology of window display, attractive arrangement of interiors, adoption of standard sanitary and convenient equipment, and general improvement of appearance. By adherence to a one-price policy and maintenance of standard qualities, the chain store has, moreover, been able to increase the confidence of the consumer in the goods that he buys and in the character of his relations with the manager of the establishment. There has been little if any effort to avoid competition between chains, and in most American cities decided inter-chain competition is observable, with the result that such gains as have been extended to the consumer are generally retained by him through competition, even after an old chain, first established in a locality, has succeeded in taking away much of the trade that formerly went to individual establishments.

**Analysis of Selling Costs.** Considerable difference of opinion and practice has existed among chain store managers as to policies to be pursued in paying employees, and these differences have led to experimentation as to selling costs, rates of turnover, and the like. It is undoubtedly true that some classes of chain stores, such as the 5- and 10-cent stores, have been desirous of employing the very cheapest grade of labor. Within recent years conditions have materially altered, and today it is recognized that efficient selling methods and capacity on the part of employees tend strongly to build up profits. In chain stores at the present time, three main methods of compensation are adopted (1) flat salary, (2) salary and commission or bonus, and (3) salary accompanied by a percentage of profits, or in some cases ownership of stock. Experience seems to show that the profit-sharing devices are able to pay for themselves, and leave something behind for the owners, through the more active participation of the employee in his work. Analyses of selling costs have been installed in practically all chain stores, and as a result, a standard selling expense divided into a variety of major elements has been established. By this method, the reports of the various units in the chains have been tested, and when excessive selling cost is noted, investigation is made for the purpose of seeing what may be the cause of it. Executive managers receive fairly large remuneration, while unit managers are paid about as much as they would receive if they were working independently, operating stores for themselves.

**Finance of Chain Stores.** The financing of the chain store is interesting as throwing light upon important sources of saving. All well-managed chain stores take the discounts for cash which are allowed by manufacturers of goods and in this way are able to save a substantial percentage of the sums which were formerly paid out by individual establishments which took the longest possible credit and then endeavored to reimburse themselves by adding the expense to prices. For the most part, the larger chains have begun on a small scale with capital belonging to the promoter or organizer and with very few stores. Later units were then financed out of the profits of the older stores. In a recent

year, the capital required per store by the Atlantic & Pacific Co. was stated as only \$4300, while Woolworth required \$43,918 and Childs Restaurant \$185,000 per store.

Chain stores have now become so well established that the best of them are recognized as substantial investments and are quoted on the stock exchanges of the country. They thus have no difficulty in financing themselves by the offering of new stock through banking houses whenever they desire to expand and are able to show satisfactory profits. Early in the year 1929, one or more investment trusts having as their object the purchase of stock in chain-store companies were organized, and at last accounts were doing a profitable business. The current or short-term financing of the chain store presents comparatively few difficulties and the methods employed there represent one of the principal advantages which the system has enjoyed as compared with the independent store system. Since the central office is usually located in proximity to large and well-equipped banking establishments, it usually has no difficulty in obtaining all of the accommodation to which it is entitled. Centralized methods of buying and economies in shipping enable it to finance its operations on the most economical basis, with the result that the amount of borrowing necessary is reduced. In those chains which adhere to the original cash-and-carry plan, and which regularly remit their takings to the head office, the extent of dependence on banks is naturally small.

In these circumstances, chain stores have been able to show very satisfactory earnings, reports varying from about 30 per cent in one chain during a recent year to a fraction over 7 per cent during the same year by one of the smaller and less well-known chains. Average earnings on capital for ten or twelve of the best-known enterprises vary between 15 and 20 per cent.

**Bibliography.** The literature on chain stores is very extensive, but among recent books on the subject may be mentioned W. J. Baxter, *Chain Store Distribution and Management* (New York 1928); and Hayward and White, *Chain Stores* (New York 1922).

**CHALIAPINE, FEODOR IVANOVITCH** (1873- ). A Russian dramatic bass, born at Kazan. Without any preliminary musical training, he became, in 1890, a member of the chorus of a traveling light opera company, whose director immediately was struck by the exceptional beauty and power of his voice and soon entrusted him with leading rôles. In 1892-93, he studied systematically with Usatov in Tiflis, and during the summer season of 1894 he made his début in grand opera at the Maryinsky Theatre in Petrograd, where he remained two years. In 1896, he joined Mamontov's Private Opera in Moscow, whence his reputation, especially as an unsurpassed interpreter of Russian national types, rapidly spread all over Europe. His first appearances at the Metropolitan Opera House, New York (1907-08) did not arouse unusual enthusiasm, probably because he had no opportunity of singing his famous Russian rôles, but when, on his second visit, he appeared as Boris Godunov (Dec. 9, 1921), his success was overwhelming. Likewise, his recitals drew capacity houses. Later, he became an annual visitor, dividing his time between the Metropolitan Opera House and the Chicago Civic Opera Company. Consult his autobiography, *Pages de ma Vie* (Paris, 1927).

**CHAMBERLAIN, THE RT. HON. (ARTHUR) NEVILLE** (1869- ). A British government official, brother of Sir Austen Chamberlain (q.v.). He was educated at Rugby and Mason College, Birmingham, and in the latter city was a member of the city council and chairman of the town planning committee (1911), an alderman (1914), Lord Mayor (1915-16), and a Unionist representative of its Ladywood division in Parliament (1918- ). In national politics, he was a member of the Central Control Board (1915), Director General of National Service (1916-17), and Postmaster General (1922-23). In 1923 he was successively Paymaster General, Minister of Health, and Chancellor of the Exchequer, holding the latter office until the advent of Labor to power in January, 1924. With the fall of Labor, he became Minister of Health (November, 1924) in the ministry which was headed by Stanley Baldwin. In 1922 he had been made a Privy Councillor.

**CHAMBERLAIN, CLARK WELLS** (1870- ). An American physicist, born at Litchfield, Ohio. He was graduated at Denison in 1894 and then studied as a fellow at Chicago, and at Columbia. In 1900-01 he was professor of physics and astronomy at Colby, then held the chair of physics at Denison (1901-08), and a similar chair at Vassar (1908-13). He was then called to the presidency of Denison, where he remained until 1925. He was with the Cavendish Laboratory of Cambridge University, 1925-27, and became associate professor of physics at Michigan State College in 1927. His original investigations have included studies on the radius of molecular attraction, achromatization of interference, and the relative motion of the earth and ether; he devised a compound interferometer, a diffractometer, and a spectroscopic of high resolving power.

**CHAMBERLAIN, GEORGE EARLE** (1854-1928). An American lawyer and public official (see Vol. V). He was reelected to the United States Senate from Oregon for the term of 1915-21, and was the author of the Chamberlain Military Preparedness Bill of 1918. He was, by appointment of President Harding, a member of the United States Shipping Board from 1921 to 1923, when he resigned. He then practiced law at Portland, Oreg., and Washington, D. C., and was engaged in several important Constitutional cases. Among these was the one involving the Oregon School of Law in reference to religion, argued before the United States Supreme Court, in which case Senator Chamberlain represented the State of Oregon.

**CHAMBERLAIN, HOUSTON STEWART** (1855-1927). A German writer (see Vol. V). Since 1914, his works include: *Lebenswege meines Denkens* (1919); *Mensch und Gott*; *Betrachtungen über Religion und Christentum* (1921).

**CHAMBERLAIN, JOHN LOOMIS** (1858- ). An American army officer, born in New York. He was graduated at the United States Military Academy in 1880, entered the Army as second lieutenant in the 1st Artillery, and continued in the military service until his retirement in 1921 as a major general. He served in the Spanish-American War of 1898-99 as chief ordnance officer with the rank of major of volunteers; in the campaign against the Sioux Indians in 1900-01; in the campaign against the Moros in the Philippines in 1903; and, after his transfer to the Inspector General's Department, continued in the service until his

appointment in 1917 as Inspector General, in which capacity he served during the World War, inspecting the American Expeditionary Forces in France in 1918. For "exceptional meritorious service," he received the Distinguished Service Medal. General Chamberlain was a graduate of the Artillery School in 1890 and of the Army War College in 1913, and was military attaché to Austria in 1897-98.

**CHAMBERLAIN, THE RT. HON. SIR (JOSEPH) AUSTEN (1863- )**. A British statesman (see VOL. V), son of Joseph Chamberlain. In the Coalition government after the outbreak of the World War, he was Secretary of State for India. Because of criticism of the lack of medical preparation for the advance on Bagdad, he resigned in 1917, although he knew nothing about the matter until too late for it to be remedied. He again took office in 1918 under Lloyd George as minister without portfolio, and later was appointed Chancellor of the Exchequer, a position he had previously held 1903-06. The budget he introduced in 1919 reduced by one-sixth the duties on articles from the colonies, thus making the principle of Imperial Preference, which had been in his father's programme fifteen years before, a regular part of the British financial system. By increasing the excess profits duty to 60 per cent, and introducing a corporation tax, he was able to balance the budget in his second year and to make a large payment on the national debt. When Mr. Bonar Law resigned the Unionist leadership on Mar. 17, 1921, Mr. Chamberlain was unanimously chosen leader of the party. He became leader of the House of Commons and Lord Privy Seal (1921-22). From November, 1924, he was Secretary of State for Foreign Affairs. He was a prime mover and a signatory of the Locarno treaties (1925). He was vitally interested in the League of Nations, and attended its sessions as head of the British delegation; but the Empire league was his first thought and his basic policy was to foster trade and add to its prosperity. In 1926 he was awarded the Nobel Peace Prize jointly with General Charles G. Dawes, at that time Vice President of the United States.

**CHAMBERLIN, THOMAS CHROWDER (1843-1928)**. An American geologist (see VOL. V). From 1898 to 1914, he was president of the Chicago Academy of Sciences. His later books include *The Origin of the Earth* (1916). He was for many years editor of the *Journal of Geology*. From 1919 to his death in 1928, he was emeritus professor of geology in the University of Chicago.

**CHAMBER MUSIC**. See MUSIC, under *Chamber Music*.

**CHAMBERS, SIR EDMUND KERCHEVER (1866- )**. An English scholar and educator (see VOL. V). His later works include *Shakespeare: A Survey* (1925) and *Arthur of Britain* (1927). He was made a Knight Commander of the Order of the British Empire in 1925.

**CHAMBERS, EDWARD (1859-1927)**. An American railway official, born in Waukegan, Ill. He began his railway service with the Atchison, Topeka & Santa Fé Railroad in 1878, and served in many important capacities with that road. He was assistant freight traffic manager for the coast lines and vice president of the road from 1905 to 1917, when he resigned to become director of transportation of the United States Food Administration and the United States Grain Corporation. He was director of

the Division of Traffic for the Federal Railway Administration from 1918 to 1920, and was also a member of the War Industries Board. He was appointed vice president in charge of traffic for the Atchison, Topeka & Santa Fé Railroad in 1920.

**CHAMBERS, ROBERT WILLIAM (1865- )**. An American author (see VOL. V). His later books include: *The Dark Star* (1915); *The Restless Sea* (1917); *In Secret* (1918); *The Crimson Tide* (1919); *Slayer of Souls* (1920); *Little Red Foot* (1921); *America* (1921); *The Hi-jackers* (1923); *The Girl in Golden Rags* (1924); *The Man They Hanged* (1925); *The Drums of Aulone* (1926); *The Sun Hawk* (1927); *The Rogues' Moon* (1927); and *The Happy Parrot* (1929).

**CHAMBERS, WILL GRANT (1867- )**. An American psychologist born in Westmoreland Co., Pa. He was educated at Lafayette, Clark, and Chicago Universities. After his graduation, he was professor of mathematics in the State normal schools of Pennsylvania and Minnesota. He was professor of education and dean of the School of Education at the University of Pittsburgh, 1909-21, and dean of a similar school at the Pennsylvania State College after 1923. His professional contributions included papers on genetic psychology, the evolution of ideas, memory types, individual differences, and correlation of character traits.

**CHANDLER, WILLIAM HENRY (1878- )**. An American pomologist, born at Butler, Mo. He was graduated from the University of Missouri in 1905 and took postgraduate courses in that institution. Until 1910 he was assistant horticulturist at the University of Missouri, instructor in 1910-11, and assistant professor from 1911 to 1913. From 1913 to 1923 he was professor of pomology at Cornell University, and in 1920-23, vice director of research. Since 1923 he has held the professorship of pomology at the University of California. Professor Chandler wrote on plant tissues and temperature, fruit and fertilizers, pruning, etc. He is the author of *Fruit Growing* (1925).

**CHANNEL ISLANDS**. See GREAT BRITAIN.

**CHANNEL TUNNEL**. See TUNNELS.

**CHANTEPLEURE, shānt'-plair GŪr (MADAME EDGAR DUSSOP, née JEANNE VIOLET) (1875- )**. A French author, born in Paris, three of whose works were crowned by the French Academy. She is the author of *Ma Conscience en robe rose*, crowned by the Academy (1896); *Le Château de la Vieillesse* (1900); *Pianée d'avril*, crowned by the Academy (1900); *Mon Ami Poiseau bleu* (1900); *Les Ruines en fleurs* (1901); *Ames féminines* (1902); *Le Sphinx blanc* (1903); *L'Aventure d'Huguette* (1904); *Le Théâtre de la Primevère* (1905); *Le Baiser au clair de lune* (1908); *La Folle histoire de Fridoline* (1908); *Malencontre* (1910); *La Passagère* (1911); *Le Hasard et l'amour* (1911); and *La Ville assiégée*. *Jamnia*, octobre, 1912-mars, 1913, crowned by the Academy, (1913).

**CHAPLIN, CHARLES SPENCER (1889- )**. A leading comedian on the motion-picture stage. He was born in London, England, and after varied experience in the theatre, made his début as a film performer in the United States in 1914, where he soon became the most familiar figure in screen productions. He starred in many pieces of his own creation, including *The Kid*

(1920-21), which was highly popular with all classes. In 1921 he visited Europe where he received a popular welcome almost without precedent. He established a motion-picture plant at Hollywood, Calif., where he has produced many popular screen comedies.

**CHAPMAN, CHARLES EDWARD** (1880 ).

An American historian, born at Franklin, N. H., and educated at Princeton University, Tufts College, Harvard University, and at the Universities of California and Seville (Spain). He was admitted to the bar in 1906, and thereafter was connected with the United Railways Company, San Francisco, and with the Western Electric Company, until 1909, when he became a teacher of history, first in the Riverside (Calif.) High School and afterwards in the University of California. He was made associate professor of history in the University of California in 1919 and professor in 1927. His works include: *The Founding of Spanish California* (1916); *A Californian in South America* (1917); *A History of Spain* (1918); *A Catalogue of Materials in the "Archivo general de Indias" for the History of the Pacific Coast and the American Southwest* (1919); *A History of California; the Spanish Period* (1921); and *A History of the Cuban Republic* (1927).

**CHAPMAN, CHARLES SHEPARD** (1879- ).

An American artist born at Morristown, N. Y., who studied with Chase and W. Appleton Clark. He was elected Associate Member of the National Academy in 1919. Among his awards were the Saltus Gold Medal from the National Academy in 1917, the Carnegie Prize from the Academy in 1921, and the second Altman Prize, N. A. D. (1926). Chapman's work as a painter and illustrator has been on exhibition in various parts of the country and one of his best known canvases, "In the Deep Woods," is in the Metropolitan Museum, New York.

**CHAPMAN, FRANK MICHLE** (1864- ).

An American ornithologist (see VOL. V). Besides his activities as curator of ornithology and conductor of zoological explorations for the American Museum of Natural History, Dr. Chapman served in 1917-18 as director of the American Red Cross Bureau of Publications and as commissioner of the American Red Cross to Latin America. He was awarded the first Elliot Medal by the National Academy of Sciences in 1918 and was president of the Burroughs Memorial Association in 1921-25. In 1928 the Roosevelt Medal of Honor was awarded to him. His later publications include *The Travels of Birds* (1916); *The Distribution of Bird-Life in Columbia* (1917); *Our Winter Birds* (1918); *What Bird is That?* (1920); *The Distribution of Bird-Life in Ecuador* (1926).

**CHAPMAN, HERMAN HAUPT** (1874- ).

An American forester, born at Cambridge, Mass. He graduated from the University of Minnesota in 1896 and took postgraduate courses at the Yale Forest School. From 1898 to 1903 he was superintendent of the United States Agricultural Experiment Station at Grand Rapids, Minn., and after a year in the United States Forest Service was instructor and assistant professor at the Yale Forestry School from 1906 to 1911 when he became Harriman professor of forest management at Yale. From 1913 to 1924, Professor Chapman was a member of the State Park and Forest Commission of Connecticut. He wrote *Forest Valuation* (1914), *Forest Mensuration* (1921), and *Forest Finance* (1926).

**CHAPMAN, JOHN JAY** (1862- ). An American author (see VOL. V). He is the author of *Homerio Scenes* (verse, 1914); *Memories and Milestones* (1915); *Deutschland über Alles* (1915); *Notes on Religion* (1915); *Greek Genius and Other Essays* (1915); *The Letters of Victor Chapman, with Memoirs* (1917); *Songs and Poems* (1919); *William Lloyd Garrison* (2d ed., revised and enlarged, 1921); *Glance toward Shakespeare* (1922); *Letters and Religion* (1923); and *Dante* (essay and translations, 1927).

**CHARCOT, JEAN MARTIN**. See **PSYCHOLOGY, ABNORMAL**; and **PSYCHOANALYSIS**.

**CHARDONNE, shâr-dôn, JACQUES** (pseudonym of BLUTELLEAU (1884- ). A French novelist. In his novel *L'Épithalame*, he tried to get away from the subjectivism, the "moi," of many of the psychological novels of the twentieth century, by describing the psychological reactions of a couple. This novel shows some influence of George Eliot's *Middlemarch* and of Tolstoy's *Anna Karenina*. He also wrote *Le chant du bienheureux* (1927).

**CHARITIES**. Recent years have seen profound changes taking place in the concept of charity. Before the World War, charitable organizations were largely concerning themselves with two things: to collect and administer funds for the relief of the needy; and to carry on constant warfare against social injustice. The tasks of social-work agencies were the work of volunteers, or persons who did not see that any special training was needed for their jobs; but since the War, the following changes have manifested themselves:

1. The professionalization of social work. At the present time, there exist as many as 26 schools and colleges for the purpose of training social workers. The result has been a great increase in the professional personnel, and it has been estimated that, from 1915 to 1925, the number of paid social workers in the United States had increased 65 per cent. There were, in 1929, about 25,000 professional social workers.

2. Social case work today is not predicated upon social injustice but upon individual inferiority. Today, there exist a number of persons who are "underprivileged," who cannot make their adjustments to society but need the care, study, and sympathetic aid of the social worker to effect that end. The concern of the earlier case worker was for the economic welfare of the family, for the creation of a minimum budget for actual material needs, etc.; but this "left little place for beauty, for creative joy, for elation of the spirit." Today, the case worker remedies maladjustments by bringing in the psychologist and psychiatrist, or by buying flowers or cheap little prints for the family being served. In other words, social case work has lost sight of the fact that the great reason for dependency today is the insecurity brought in the train of our modern industrial life, and that the average man does not need "creative joy" but protection against unemployment, invalidity, sickness, and premature old age. These, naturally, only the State can give. It is interesting to note that, in the fight being carried on for State programmes of social insurance, the professional social worker is either silent or is in the opposition. For example, at the very time (1929) that New York's governor was urging a State system of old-age pensions, the or-

ganized welfare agency of New York City was complaining that there were not enough institutional beds for old people.

3. The formation of community chests. As a result of the experiences of the War, it was found that funds could be more expeditiously raised, to the satisfaction of the large givers, if but a single drive were made every year. By 1928 there were existing, in 300 communities in the country, these "community chests" for the collection of funds needed for social-service purposes. Among them, they raised in the neighborhood of \$65,000,000 annually. Unfortunately, the chest was depriving charitable giving of its personal interest, was leading to the acceptance of modern business ideas where the only thing that counted was that the drive "should go over the top," and was forcing regimentation in social work in that the participating agencies were being scrutinized from the point of view of per-capita costs.

4. Charitable funds were being increasingly concentrated in foundations. By the end of 1928, there were in existence in the country at least 100 of these with probably one billion dollars in investments among them. Seven of the largest, to wit, the General Education Board (founded 1903), Milbank Fund Association (1905), Russell Sage Foundation (1907), Carnegie Corporation (1911), Rockefeller Foundation (1913), Commonwealth Fund (1918), Laura Spelman Rockefeller Memorial (1918), had combined endowments of one-half billion dollars and annual incomes totaling 28½ millions. These charitable foundations had the following in common: they did not grant charity to individuals; they did not engage in emergency relief; they did not ordinarily contribute to the budgets of welfare societies; they were spending their money in research, education, and health. Increasingly, individual fellows were being taken care of to carry on researches in the social sciences. Some of the money was being spent wisely, some very foolishly indeed. As yet, no adequate examination has been made of the operations of these funds to determine whether the benefactors were right in disposing of their fortunes as they did. From the history of some of these foundations, it would appear that the rich man is finding trouble in disposing of his fortune for the "good of his fellow men."

The bill of American private social work is gigantic today. It has been estimated that the country sees being spent annually as much as two billion dollars on philanthropic activities: In New York City alone, there are 1200 social agencies in operation. The income of social welfare agencies in 19 cities, only one of which had a population of more than one million, amounted in a single year to \$112,780,524. Throughout the country, there are 15,000 welfare institutions (public and private), divided as follows: 4900 general and special hospitals; 3500 prisons, reformatories, etc.; 2700 children's homes; 2100 almshouses; 1300 homes for the aged; 526 mental hospitals; 168 institutions for the feeble-minded and the epileptic; 125 institutions for convalescents and incurables. These institutions minister to approximately six million persons annually.

As a result of the questions brought up by the contemplation of the motives and methods of private philanthropy, people were beginning to point out that the care of dependency was the concern of the State and not of individuals.

Just as the State had proceeded to the aid of dependent children with pensions for their mothers and had put on the statute books laws for the compensation of workmen injured during their work, so it was the business of the State to take care of the sick, the unemployed, the inviolated, and the aged. What progress has been made in agitation for new social insurance codes will be found in the articles SOCIAL INSURANCE, OLD-AGE PENSIONS, UNEMPLOYMENT. See also the articles MOTHERS' PENSIONS, JUVENILE COURTS, WORKMEN'S COMPENSATION, MINIMUM WAGE, WOMEN IN INDUSTRY, etc.

**CHARLES I, EMPEROR OF AUSTRIA AND KING OF HUNGARY (1887-1922).** The last of the Hapsburg rulers, successor to the Emperor Francis Joseph, was born at Persenbeug, Aug. 17, 1887, the eldest son of the Archduke Otto. He was little known until after his marriage with Princess Zita of Parma, in 1911. He attended one of the large Viennese boys' schools and spent his military life in distant garrison towns. During the World War, he nominally commanded the army that invaded Rumania. On the death of the Emperor Francis Joseph on Nov. 21, 1916, Charles proclaimed himself supreme war lord, and he and his consort were crowned King and Queen of Hungary in Budapest, December 30. During the War, he addressed a letter to his brother-in-law, Prince Sixte of Bourbon-Parma, in which he supported the claims of France in Alsace-Lorraine, and proposed the restoration of both Belgium and Serbia. Charles disavowed the letter, when it was published, in April, 1918, but it had a disheartening effect on the Central Powers. After the political and military collapse of Austria-Hungary, on Nov. 11, 1918, Charles relinquished the throne of Austria, and two days later that of Hungary. In March, 1919, he left Austria to live in Switzerland and in April of that year the Austrian Parliament formally deposed him, annulled all the sovereign rights of the House of Hapsburg, and exiled its members from Austria. Charles made no attempt to regain the Austrian throne, but in March, 1921, and again in October of that year, he escaped from Switzerland to Hungary, where his efforts to regain power were unsuccessful. These attempts made it evident that Switzerland was no longer a safe place for him. A British warship took him and his wife to Madeira where he arrived Nov. 19, 1921. He died there April 1, 1922.

**CHARLES, THE VEN. ROBERT HENRY (1855- ).** A British divine and author (see Vol. V). In 1919 he was made archdeacon of Westminster Abbey. From the same year, he was Warburton Lecturer in Lincoln's Inn Chapel, and Schweich Lecturer in 1919-20. He received the first award of the British Academy's Medal for Biblical Studies. His later works include: *Religious Development Between the Old and New Testaments* (1914); *The Chronicle of John of Nikiu translated from the Ethiopic* (1916); *Sermons Preached in Westminster Abbey* (1917); *The Apocalypse, edited with Text, Translation, and Commentary* (2 vols., 1920); *The Teaching of the New Testament on Divorce* (1921); *Lectures on the Apocalypse* (Schweich Lectures, 1919, 1922); *The Adventure into the Unknown* (2d impression, 1923); *The Decalogue* (Warburton Lectures, 2d impression, 1924); *Gambling and Betting* (2d impression 1925); *Divorce and Nullity* (1927), and *Critical Commentary on the Book of Daniel* (1929).

**CHARNWOOD**, GODFREY RATHBONE BENSON, FIRST BARON (1864- ). An English historian, educated at Balliol College, Oxford. He was a member of Parliament from 1892 to 1895 and Mayor of Litchfield from 1909 to 1911. In the latter year, he was made a baron. In 1916 he published a biography of *Abraham Lincoln* which was very favorably received in the United States. In 1923 he published an interpretative biography of *Theodore Roosevelt*; in 1926, *According to St. John*; and *Tracks in the Snow* (1927).

**CHARTERS**, WERRETT WALLACE (1875- ). An American educator, born at Hartford, Ont., Canada, who was graduated from McMaster University, Toronto, in 1898, and took postgraduate courses at Columbia University and at the University of Chicago. He was professor of the theory of teaching at the University of Missouri, 1907-17, dean of the School of Education there, 1910-17, professor of education at the University of Illinois, 1917-19, and professor of education and director of the research bureau for retail training at the Carnegie Institute of Technology, 1919-23. He had a similar chair at the University of Pittsburgh, 1923-25. Since 1924 he has been professor of education at the University of Chicago. He was the author of *Methods of Teaching* (1910), *Teaching the Common Branches* (1913), *How to Sell at Retail* (1922), and *Curriculum Construction* (1923), and also contributed numerous bulletins and articles to educational journals. He edited many series of educational books.

**CHARTERS FOR CITIES**. See MUNICIPAL GOVERNMENT.

**CHATEAUBRIANT**, shá'tó'bré-án', ALPHONSE DE (1877- ). A French author who was born at Rennes and educated at Nantes. Besides stories for reviews, he wrote only two novels, *Monsieur des Lourdines*, which received the Prix Goncourt for 1911, and *La Brière*, translated as the *Peat Cutters* in 1927, a realistic study of the people and the country of La Brière, which was awarded the Grand Prix du Roman of the French Academy in 1923.

**CHÂTEAU-THIERRY**. See WORLD WAR.

**CHAT TERTON**, EDWARD KEBLE (1878- ). An English author and journalist (see VOL. V). He entered the Royal Naval Volunteer Reserve as Temporary Lieutenant in 1914 and was promoted to the rank of Acting Lieutenant Commander in 1918. He was in the Auxiliary Patrol Service in command of various ships (1914-17) and was on the staff of the historical section of the Committee for Imperial Defense (1917-21). His later works, which deal mainly with the sea and its life, include: *The Old East Indiamen* (1914); *The Romance of Piracy* (1914); *Q-Ships and their Story* (1922); *The Mercantile Marine* (1923); *Ship Models* (1923); *Seamen All* (1924); *Steamship Models* (1924); *Whalers and Whaling* (1925); *The Ship Under Sail* (1926); *Windjammers and Shellbacks* (1926); *The Brotherhood of the Sea* (1927); *Captain John Smith* (1927); and *Old Sea Paintings* (1928).

**CHATTERTON**, RUTH (1893- ). An American actress born in New York City. She made her stage debut in Washington, D. C., in 1909, as Polly Trippett in *Mercy Mary Ann*. She came to New York in 1911 and three years later first played Judy Abbott in *Daddy Long Legs*, a part which made her famous throughout the United States. Other of her well-known

characterizations include: Olivia Dangerfield in *Come out of the Kitchen* (1916); Mrs. Calthorpe in *Perkins* (1918); Comtesse de Candale with Henry Miller in *A Marriage of Convenience*; Judith Baldwin in *Moonlight and Honey-suckle* (1919); Mary Rose in the play of that name (1920). She appeared in *La Tendresse* (translated from the French by herself, 1922); and in *The Changelings* (1923).

**CHAUTAUQUA INSTITUTION**. An organization founded in 1874 at Chautauqua, N. Y., conducting an annual series of lectures and entertainments called the general assembly; a six weeks' summer school; and a home reading circle. By an arrangement made in 1923, the department of education of the summer school is carried on by New York University, and credit given in the University to all students successfully completing the work. In addition to the primary school and kindergarten managed by the Institution, a summer high school was established in 1927. About 45,000 persons attended the general assembly each year between 1924 and 1929; by 1928 there were 19 departments in the summer school, with 125 instructors, and 2500 students.

**CHEESE**. See DAIRYING.

**CHELMSFORD**, chēmz'fôrd, FREDERICK JOHN NAPIER THESIGER, VISCOUNT (1868- ). A British public official who was educated at Oxford. He became a member of the London School Board (1900-04), and of the County Council, 1904-05. He was Governor of Queensland from 1905 to 1909, and of New South Wales from 1909 to 1913. In 1916 he was made Viceroy of India, retiring from that office in 1921 when he was made a viscount. He was a Conservative in politics, and much surprise was felt when he was asked to take the place of First Lord of the Admiralty in Ramsay MacDonald's Labor cabinet early in 1924. He accepted the post, however, as he found himself in accord with the new premier's policies. In 1926-28 he was temporary Agent General in London for New South Wales.

**CHEMICAL WARFARE**. The active beginning of the use of toxic gas in the World War dated from Apr. 22, 1915, when chlorine was released by the Germans in an attack against the French and British lines in the northeastern portion of the upper Ypres salient (see WORLD WAR). This was indeed a momentous step for the Germans, as it introduced into civilized warfare a new weapon which led to new tactics of offense and defense.

The importance of the use of toxic gas in modern warfare is shown by the fact that during the year 1918, from 20 to 33 per cent of all the American battle casualties were due to it, but there was the compensating feature that where armies were supplied with masks and other defensive equipment only about 2 per cent of the gas casualties were fatal as compared with 24 per cent for those wounded by high explosive shells, shrapnel, bullets, etc. By far the greater part of the gas casualties resulted from the gas projectiles fired by field artillery, which in the British Army reached the great total of 180,000. In fact, it was estimated that 90 per cent of the total gas casualties could be thus accounted for, notwithstanding the heavy losses at the first attacks in 1915 among troops quite unprepared when cloud gas was released from cylinders. Trusting to air currents to carry the gas was not satisfactory, and it

was charged into projectiles which could be fired from guns, howitzers, or mortars.

The use of lethal shells began in 1916 and these projectiles charged with deadly gases were used in addition to the lachrymatory gases. The three main killing gases used in chemical warfare were phosgene, diphosgene, and chlorpicrin. Their use made improved masks or respirators essential, and it was a constant contest between developing new toxic gases and finding adequate protection against them.

*Chlorine* was the first gas to be used and after it had been allowed to escape from cylinders, it was found that in its liquid form it could be filled into bombs or drums, which, discharged from crude mortars, would be detonated in the usual way by a fuse and booster charge and small bursting charge of high explosive. Chlorine is a greenish-yellow gas of strong suffocating odor which commercially is used for bleaching and purification of water supplies. By cold and pressure, it is liquefied for storage and transport. At Ypres, the Germans permitted this gas to float out, but they were insufficiently supplied with it, and also without means of protecting themselves so that they were afraid to advance through it.

*Phosgene*, a gas formed by the combination of chlorine and carbon monoxide in the presence of a catalyzer, is a colorless gas that liquefies at 8° C. It was one of the deadliest gases used during the War and was employed not merely to annoy or to compel the wearing of masks but to kill as many as possible. It was often used in an attack as it did not persist long in the air or on the ground after the explosion of the shell, and as a result it would clear away by the time that the oncoming troops reached the place of gas concentration.

*Chlorpicrin*, a liquid that is an active poison and, in addition, a lachrymator or tear producer, is made by the reaction between picric acid or calcium picrate and chlorine. It is a colorless liquid that boils at a temperature of approximately 112° C. and the gas while not so poisonous as some of the toxic gases nevertheless was quite efficient. This, after chlorine, was the first war gas to be made on a large scale in the United States.

*Mustard Gas*, *Dichlorodiethyl Sulphide*, was introduced by the Germans in July, 1917, at Ypres and immediately became a most effective agent in gas warfare. It also proved a boomerang for the Germans, as they never were able to improve their original facilities for manufacture which could not produce more than 6 tons per day at the end of the War. At that time, France and England had improved methods and quantity production, while the United States had 10 times the German capacity at the time of the Armistice. This gas, it is interesting to note, was prepared by the Germans by the method originally described by Victor Meyer and later developed in Emil Fischer's laboratory. Mustard gas is a colorless, slightly oily liquid boiling at 220° C. with some decomposition and freezing at 14° C. or below, the former temperature applying to the pure liquid. Mustard gas was not necessarily fatal except in sufficient amounts and it acted on the skin like a deep burn. It attacked the lungs, the eyes, the skin, and even the intestines. It blistered the skin and produced nausea, thus requiring the removal of the mask. It had a delayed action and often a man might be gassed even fatally

before he was aware of it, and then he was beyond the reach of treatment. Ground soaked with mustard gas remains impregnated for days continually giving off the vapor.

*Diphosgene*, or superpalite, perchloromethyl formate, was extensively employed by the Germans as was *diphenylchlorarsine*, their blue-cross gas, which produced sneezing and a disagreeable temporary sickness. The latter gas was not considered by the Allies very efficient though made by the Germans in large amounts. *Diphenylcyanarsine* and *ethyl dichlorarsine* were also employed by the Germans.

Lachrymatory or tear gases were extensively used during the World War by both sides in order to annoy and cut down the efficiency of the enemy and most of all to compel him to keep masked continually. This form of gassing was cheaper than the use of poison gas and even a trace of tear gas in the air would blind a man temporarily. In fact, a single tear-gas shell could distribute its charge so widely as to require the wearing of masks over an area so wide that from 500 to 1000 phosgene shells would be needed for the same effect. The tear gas was irritating to the membranes of the eye, and so far as it alone was concerned goggles might suffice for protection, but the usual practice was to mix it with deadlier gases. Most tear gases had chlorine or bromine as a base, the bromine being derived from subterranean brines, and the gas could be used alone, but such combinations as brombenzyl cyanide were made, the one specified being extensively produced in the United States.

In addition to the gases mentioned, others were employed and new toxic materials were developed during the War by organic and physiological chemists. Much was accomplished that was never revealed, and had the War continued another year the annihilation of the Central Powers by the discharge from aircraft of deadly gases produced in the United States and elsewhere was predicted.

**Gas Masks.** Naturally the use of gas immediately resulted in defensive measures. After the first attack by the Germans in 1915, extemporized masks and impregnated fabric helmets were rapidly developed in England and hurried to the Continent, consisting merely of gauze pads soaked with neutralizing chemicals. Then came masks or helmets of a box respirator type first introduced by the British in August, 1916, where absorbing and neutralizing chemicals purified the air before it was inhaled by the wearer. An essential element of these respirators was the charcoal, which had to be prepared with great care. Gradually, the British and the Americans developed double protection masks which were efficient under all conditions. There were also protective suits and gloves to resist mustard gas.

**Tactical Use of Gas.** By 1917 the extensive and effective use of gas led to the development of special tactics both for attack and defense. Shells filled with gas and appropriately painted or striped to indicate the charge were issued along with shrapnel and high explosive. The kind of gas selected was determined by the nature of the plan or the military objective, all carefully considered especially with regard to the target and terrain. For example, in case of an advance, a gas that would disperse readily would be employed, or it might be that lanes would be left for the troops going up to seize

or contest an objective. It must be remembered that while an ordinary high explosive or shrapnel shell exerts its effect immediately after the burst, that of a chemical shell has just begun and may even persist in the case of some of the chemical charges for a week or ten days. Furthermore, a bomb-proof shelter, safe against flying fragments, is no protection against a chemical shell whose fumes can pass around corners or sink into the ground.

The artillery during the War made a distinction between "lethal" and "neutralizing" projectiles and fire and this was the basis of the marking of the shell. The lethal shell is used to produce casualties and was employed against occupied positions for surprise effect, the object being to concentrate the greatest possible number of shells on the target in the smallest time, which should not exceed two or three minutes, as in that time gas masks can be adjusted and no further casualties should develop. In attacks of this kind, phosgene is employed. With neutralizing shells or those filled with chemicals which are persistent and vaporize slowly, a slow searching fire is maintained scattered over the area to be neutralized. In other words, the aim is to develop an atmosphere intolerable for unprotected troops, so that the artillerist seeks to find lines of communication, camps, rest billets, trench systems, cross roads, battery positions, and in short any point where troops are likely to be concentrated. The aim is to make them wear respirators, thus cutting down their efficiency in using field or machine guns, in construction or supply work or the bringing up of transport. See STRATEGY AND TACTICS.

**Grenades.** The modern grenade is in effect a small explosive shell thrown at the target by the soldier with his good right arm or by means of an attachment (tromblon) fastened to the muzzle of his rifle. The so-called defensive grenade consisted of a gray-iron casting, the grenade body, which contained an explosive charge of nitrostarch and a suitable firing mechanism designed to prevent explosions until the thrown grenade was a safe distance from the thrower. The defensive grenade was intended to burst into fragments and was used only by men actually within the trenches, the walls of which would protect the thrower from flying fragments. This fragmentation type of grenade was the most used and the most useful of all developed during the War. An American contribution to trench warfare was the offensive grenade, the body of which was made of paper which produced its deadly effect by the flame or concussion of the explosive itself. This type was safe to use in open offensive movements since there were no fragments of metal to fly back and injure the thrower. Gas grenades, the bodies of which consisted of two sheet-metal cups welded so as to be gas-tight, were under development and were used principally to make the enemy trenches and dugouts uninhabitable on release of their toxic contents.

Phosphorus grenades, of construction similar to the gas type, were used to scatter burning phosphorus over an area 10 to 15 feet across. The dense cloud of white smoke thus produced was utilized to build smoke screens for the protection of troops in open attack on machine-gun nests. Incendiary grenades were essentially paper bombs filled with highly inflammable material and intended for use in destroying struc-

tures by fire. In still another class was the Thermit grenade, consisting of aterne-plate container filled with Thermit, a patented composition which developed an intense heat while melting. These grenades found their principal use in destroying captured guns which could not be moved, by fusing the breach mechanism to an extent preventing further use. A combination mount and rifle grenade also was developed by the British and later adopted by the United States Army. The great majority of rifle grenades were of the French Viven-Bessière type, provided with a hole extending entirely through the middle of the grenade. In order to use this grenade, a specially designed holder is fitted to the muzzle of an ordinary service rifle. When the rifle is fired, the bullet passes through the hole in the grenade and the discharged gases following the bullet have enough energy left to throw the grenade approximately 200 yards. The rifle grenade was used both as a defensive and an offensive weapon, since the firers were well out of range of the exploding missile, which had an effective radius of nearly 75 yards on burst.

**CHEMISTRY.** In chemistry, the years following the outbreak of the World War formed a period whose most characteristic feature has been turmoil and upheaval in what seemed the very foundations of the science. In many fields, however, the new data have already been assimilated and the science has won through to clear, definite, and more inclusive concepts to take the place of those which had proven inadequate. Periods of great activity in any science generally follow and have their roots in the discovery of new facts or of new methods of investigation. The great activity in the investigation and development of fundamental chemical theory, which, slackened by the World War, burst forth with all the greater volume with the peace, traces back very largely to the discovery of two methods of investigation in the years just before the War. These are the positive ray analysis of Sir J. J. Thomson and Aston, and the X-ray analysis of crystal structure developed by Laue and by W. H. and W. L. Bragg.

**Isotopes.** There is no principle in chemistry more fundamental than that of the constancy of combining weights. Thus, 35.458 grams of chlorine, no more, no less, combine with 107.880 grams of silver. There can be no quantitative analysis, no quantitative relations whatsoever in chemistry without this constancy. An analyst who determines the proportion of chlorine in a material does not do so by converting the combined chlorine to elementary chlorine and weighing it, which is difficult or even impossible. He converts the chlorine to silver chloride by known simple methods, weighs the silver chloride, and calculates the proportion of the chlorine in the original material by assuming that the proportion of chlorine in silver chloride is always

$$35.458$$

$$107.880 \div 35.458.$$

From the time of Dalton until quite recently, there had seemed to be but one possible interpretation of the constancy of combining weights. According to this, the weights of the atoms of chlorine and silver are in the proportion of 35.458 to 107.880, one atom of chlorine combines with one atom of silver when silver chloride is formed, and all atoms of chlorine have the same weight. Yet there is now convincing evidence that this constancy in combining

weight is due not to a constancy in weight of the atoms of chlorine but to the existence in constant proportions of two kinds of chlorine atoms of atomic weights 35 and 37, respectively. The experimental fact of constancy in combining weight remains, but the theoretical interpretation of constant weight of the atoms of a given element proves incorrect. There could be no better example of the way in which ideas, which seem inseparably bound up with certain facts, can be replaced by entirely new and contrary ideas without any controversion of the facts.

The first evidence in this direction came from the study of radioactive elements. Soddy suggested in 1911 that lead produced as the end product in radioactive change might be chemically identical with ordinary lead yet differ in atomic weight and predicted specifically that lead produced in the uranium radium series of radioactive changes should have a lower, lead produced in the thorium series should have a higher, atomic weight than ordinary lead. Experiments carried out by himself and by others—notably Richards of Harvard, the leading exponent of precise atomic weight determination—proved that these predictions were indeed true. In spite of the differences in combining proportions, the three kinds of lead were all lead, identical with each other in all the properties by which the identity of a substance is determined and incapable of separation by ordinary chemical methods, no matter how refined or how persistent the work. A single element such as lead can then exist in varieties, which differ only in atomic mass and derived properties. Such varieties of a single element are called its isotopes.

Proof of the existence of isotopes among non-radioactive elements became possible through Sir J. J. Thomson's invention and through Aston's extensive development and application of a new and ingenious method of determining the weights of atoms, the method of positive ray analysis. When an electrical discharge passes through a gas at low pressure, the molecules present are disrupted. Many of the fragments, including the atoms of the elements present, are electrically charged and are set in motion by the electric field present. Since a beam of atoms thus produced leaves a trace on a photographic plate, it is possible to study the extent to which these atoms are deflected from a straight course by electrical and magnetic fields at right angles to their path. Other things being equal, a heavy atom is less deflected than a light one and the masses of all the atoms present in a given gas can be determined from such deflections. Such measurements give true atomic masses and, when isotopes of a single element are present, each produces its own effect dependent upon its mass, whereas the combining weight gives an average of the atomic weights of the isotopes. In 1913 Sir J. J. Thomson showed in this way that the element neon is composed of two varieties of atoms of atomic weights 20 and 22. Aston took up the work later and in 1920 there appeared the first of a long series of publications from which it is now known that many elements are mixtures of isotopes in constant proportion.

The constancy of the proportions of the isotopes of a given element is a most striking result and one whose cause is still obscure. Except for the radioactive elements, including those varieties of lead which are believed to have been

formed by radioactive decomposition, the utmost exertions have failed to show the slightest difference in the combining weights of different samples of elements which are known with certainty to be composed of two or more isotopes. Thus, Baxter and Parsons in 1922 compared carefully the atomic weight of nickel of terrestrial origin with that of nickel from a meteorite of extra-terrestrial origin and found no detectable difference. Similar studies have since been made on other elements. The conclusion is inescapable that, whatever the process by which the elements are formed, and no one doubts that they are composed of the same fundamental stuff, the process of formation, both on this earth and in whatever part of the universe is the source of the meteorites, produces the isotopes of a given element in a constant proportion.

**The Unitary Concept of Matter.** The same measurements of Aston's have given great support to the unitary concept of the nature of matter. He finds, namely, that the true weights of the atoms are whole-number multiples or very nearly so of a number which is almost the same as the atomic weight of hydrogen, the element with the lightest atoms. The old hypothesis of Prout, that all of the elements are built up from hydrogen, founded on the existence of many elements whose atomic weights are not even approximately whole-number multiples of the weight of the hydrogen atom. But if chlorine consists of two kinds of atoms with weights of 35 and 37, instead of one kind with an atomic weight of 35.458, this idea becomes rejuvenated, especially since relativity theory can account fully for such discrepancies from the whole-number rule as remain. It is now clear that all matter must be built up from the same fundamental stuff, and that transmutation of the elements is theoretically possible. Actually, however, transmutation has been realized only in the case of radioactive changes, which man is unable to control even to the extent of modifying the rate of the change, and in the case of certain lighter elements, which Rutherford has shown to be decomposed when their atoms are struck by the high-speed projectiles resulting from the spontaneous decomposition of radioactive atoms.

**Separation of Isotopes.** In spite of the fact that the isotopes of most elements exist in nature in constant proportions, and that without the benign provision of this constancy chemistry as a quantitative science could not exist, the chemist has perversely but characteristically insisted upon trying to separate or even partially to separate complex elements into their constituent isotopes. It has been amply demonstrated that no chemical process and no process of crystallization can accomplish this because of the absolute identity of the properties of isotopes. It is, however, possible to take advantage of the difference in mass, which results in a difference in the rates of gaseous diffusion of isotopes. In this way sufficient separation to produce a measurable change in atomic weight has been obtained at the expense of enormous labor. This demonstration has been carried out by Bronsted and Hevesy at Copenhagen and by Harkins at Chicago.

**The Determination of Crystal Structure.** In 1912 Laue in Switzerland proved that X-rays, whose nature had been in doubt, are light, but light of a wave length so small that it is of the same order of magnitude as the distance between

the atoms of crystalline substances. The proof rests upon the fact that X-rays are diffracted by the ordered arrangement in lines and planes of the atoms in a crystal just as visible light is diffracted by the lines of a ruled diffraction grating. The genius of W. H. and W. L. Bragg solved the difficult problem of determining simultaneously the wave length of certain X-rays and the arrangement of the atoms in certain crystals, and it is now possible therefore to use the method of crystal diffraction to determine either the wave length of unknown X-rays or the arrangement of atoms in a crystal of unknown structure.

**The Nature of Salt Crystals.** The very first structure determinations that the Braggs made, that of the chlorides of sodium and potassium, announced the overthrow of an idea which chemists had held complacently ever since there was a molecular theory of chemistry. The result which they obtained was, namely, that the crystal of sodium chloride consists of a three dimensional chessboard of sodium and chlorine atoms. In this, six equivalent chlorine atoms surround each sodium atom, and six equivalent sodium atoms surround each chlorine atom. It is obvious that one black square of a chessboard does not bear a particular relation to any one of the four white squares which surround it. No more does one sodium atom in a sodium chloride crystal show any evidence that it is associated to form a molecule with any one of the six equivalent chlorine atoms which surround it.

The theory that a particular sodium atom is combined with and associated with a particular chlorine atom to form a molecule of sodium chloride was originally developed to explain the properties of gases; it had been extended on the basis of considerable evidence to liquids, but it had been applied to solids simply for the reason that there was no evidence against it. With this evidence of the Braggs, chemists came to the realization that they had really had no evidence for the assumption that molecules exist in solids, and that the new idea is simpler and more satisfactory than the old.

It soon appeared that what is true of sodium and potassium chlorides is true in general of salt-like substances; that magnesium oxide, calcium carbonate, sodium nitrate likewise consist of just such a chessboard arrangement of the metallic part and the acidic part of the salt. All of these truly salt-like compounds share certain other properties. They have high melting and boiling points, and most important of all, they conduct the electric current excellently when they are converted to a liquid either by fusion or by solution in a solvent. In the liquid state then, they are largely composed of ions, that is to say, of electrically charged atoms or groups of atoms.

It was not, therefore, a very bold step to suppose that the crystalline salt is also composed of charged atoms which are held in a rigid structure so that motion and hence electrical conduction is now impossible; that the very forces of cohesion of the crystal depend essentially upon the attraction between the positive and negative charges. Starting in 1920, Born and others at Göttingen made a determined mathematical attack upon this problem and showed that there are no properties of these simple salt crystals which are not in complete agreement with the principle that the forces which hold the crystal together are essentially electrical in nature, and

that the salt crystal is an assemblage of electrically charged ions.

**The Electronic Theory of Chemical Combination.** An electronic theory of chemical combination was first proposed by Helmholtz in 1880 simultaneously with the proposal that electricity is atomic in nature. Helmholtz's idea was this: Faraday's laws of electrolysis prove that electricity reacts by atoms with atoms of matter. Atoms therefore can lose or gain electrical charge only in quantities equal to one or more atoms of electricity.

Interpreted in the light of the later demonstration that atoms of electricity are always negative atoms, called electrons, this means that the reaction between sodium and chlorine consists in the transfer of one electron from each sodium atom to a chlorine atom. This leaves the sodium atoms with unit positive, the chlorine atoms with unit negative charge, and the atoms then cling together because of their charges. The crystal structure investigations show, however, that the sodium and chlorine atoms do not cling together in pairs, but build up a much larger assemblage in which there is alternation of positive and negative charges.

The law of definite proportions becomes in this case a consequence of the atomic nature of electrical charge. It results from the fact that the quantity of electricity which a sodium atom can lose is one electron, which is also just the quantity that one chlorine atom can gain. The crystal will tend toward electrical neutrality as the condition of greatest stability and this results in the presence in it of equal numbers of sodium and chlorine atoms. Therefore, sodium and chlorine will combine in a constant proportion which is the proportion of the weights (or average weights) of the atoms of sodium and chlorine. This makes for an extremely simple and satisfactory interpretation of a great deal of chemistry. Sodium is a characteristic monovalent metal because its atoms contain one loosely held electron, and one only. Chlorine is a reactive monovalent non-metal because its atoms are capable of attaching firmly one and only one extra electron. One magnesium atom combines with two chlorine atoms because magnesium atoms contain two loosely held electrons, and so on.

**Non-Polar Compounds.** The simple and attractive electrical theory of chemical combination never became generally accepted by chemists, in spite of the great interest in it and the extensive efforts to apply it which accompanied the tremendous usefulness of the electron theory in physics. The reason is the complete failure of this theory to account for what are called non-polar compounds. To take a simple example of this very common type of combination, the properties of the hydrogen molecule, which consists of two hydrogen atoms, are quite contrary to this theory. It is at first sight possible to suppose that two hydrogen atoms can exchange an electron so that one becomes positively, the other negatively, charged, and that they then cling together in a molecule; but if this were so, the hydrogen molecule would be an electric dipole; it would be positively charged on one end, negatively charged on the other, and Debye has shown that a substance consisting of molecules possessing this kind of electrical dissymmetry must have certain easily recognized properties. Such a substance, and many actual examples are known, must have a relatively large

dielectric constant, and one which varies markedly with temperature and with frequency. In fact, the value of the electrical moment of a molecule may be calculated from the temperature coefficient of the dielectric constant. Now, gaseous hydrogen lacks these properties completely, and behaves in every way as it should if its molecules are entirely symmetrical electrically. The simple electronic theory fails here and with many other important substances, notably with most of the carbon compounds, which are so important to life.

It seems further to be true that crystals of these non-polar compounds contain the same molecules which exist in the gaseous or liquid states, contrary to the assumption made by some in the first enthusiasm engendered by the Braggs' results.

It is chiefly to G. N. Lewis of the University of California that we owe the recognition of the fact that sodium chloride may be formed by a transfer of charges from sodium to chlorine and a clinging together of the charged atoms thus produced, and that hydrogen may nevertheless be formed by a fusion of the structures of two hydrogen atoms without any transfer of charge, any development of polarity. There seem to be two kinds of chemical combination, the polar typified by sodium chloride, and the non-polar typified by hydrogen. Whether these types merge gradually, so that there are intermediate cases in which at least a partial transfer of charge is accompanied by some fusion; and where, if the two types of combination are mutually exclusive, the line of demarcation is to be drawn, is a subject still much under discussion.

The nature of the non-polar combination of atoms is a problem of great importance, but one which must still be considered far from solution. Chemists have accumulated a vast amount of information and have developed many empirical generalizations, which await a greater synthesis and a harmonizing with the generalizations of the new physics on the structure of atoms. Among such empirical generalizations may be mentioned the far-reaching conclusions of Alfred Werner of Zürich. Werner worked from the assumption that complex ions, that is, groups of atoms bound together and carrying a charge, are held together by the same types of linkage and have the same kind of structure as the neutral molecules of organic chemistry, and derived a set of very general rules about chemical combination. Most of this work was done before 1910, but the full appreciation of its importance was somewhat delayed. That it is appreciated is shown by the Nobel Prize award to Werner in 1913 and by the extensive use made of Werner's conclusions in the speculations of Lewis and of Langmuir.

**Solutions of Electrolytes.** A development of the greatest importance to chemistry and one which is closely related to the newer knowledge of the nature of salt crystals which rose from the discovery of the Braggs is the simplification in the theory of the nature of salt solutions which is generally called the principle of the complete ionization of strong electrolytes.

Acids, bases, and salts form a large and important section of the subject matter of chemistry, both pure and applied. That solutions of these substances contain electrically charged atoms or groups of atoms, called ions, has been generally believed since the foundation of elec-

trochemistry by Faraday in 1835. Only so can one understand such facts as the conduction of electricity by these solutions, the motion of their constituents with the current, and the chemical reactions at the electrode. Thus, the copper in a copper salt solution moves toward the negative electrode when current flows, at the negative electrode copper is deposited, and copper dissolves from the positive electrode if this is copper. The copper acts as if positively charged in its salt solutions, copper metal can be converted to the salt by positive charges, and copper metal can be obtained from the salt solution by neutralizing the positive charge.

Until 1881, however, it was supposed that the concentration of these electrically charged ions is extremely minute. The proposal in this year by the Swedish scientist, Arrhenius, of a method of estimating the concentrations of ions in solution changed this view considerably. According to the conclusions of Arrhenius, which soon won general acceptance, there are many electrolytes, including most salts in aqueous solution, which are quite largely dissociated into ions. These are called strong electrolytes, and it was found that all strong electrolytes of a given valence type have very nearly the same large extent of ionization in solutions of a given concentration. In addition, there are many weak electrolytes, substances of the most widely varying degrees of ionization, some almost strong, some hardly ionized at all. This theory became one of the most important features of the great development of what is called physical chemistry, and furnished the foundation of the knowledge and understanding of the physical properties and of the chemical reactions of solutions of acids, bases, and salts.

The prime reason for the importance of this theory is the principle that the properties of an electrolyte solution are largely the properties of its ions. The theory explains the physical property that all dilute copper-salt solutions have the same blue color and the chemical property that all copper-salt solutions give a black precipitate with hydrogen sulfide upon the basis that both the color and the reaction are properties of copper ion and that all copper-salt solutions contain this ion. There was always the inconsistency, however, that the Arrhenius methods of estimating degree of ionization indicate that a significant proportion of the electrolyte remains unionized, yet exerts no effects upon the properties of the solution. These methods indicate, for instance, that a moderately dilute solution of copper sulfate contains only 40 per cent of its copper in the form of copper ion and 60 per cent as copper sulfate, whereas color and properties in general indicate the presence of copper ions and sulfate ions, but give no evidence for the presence of unionized copper sulfate.

It is only since 1923, however, that the mathematical theory of Debye and Hückel has made it clear that the Arrhenius methods of determining degree of ionization are over simplified; that they neglect certain important effects which are due to the charges on the ions; and that, if these complications are given due consideration, there exists no obstacle to the belief that the ionization of copper sulfate and other strong electrolytes is practically complete. It is a hypothetical extrapolation to say that there is no copper sulfate in a dilute copper-sulfate solution, but it is unquestionably true that there

are no known properties of the solution which necessitate the assumption that copper-sulfate molecules are present, no convincing reason for believing that there is anything in the solution but copper ions and sulfate ions. Out of the discovery of the complexity of the methods of determining degree of ionization, we have developed a great simplification of our views on the nature of electrolyte solutions; and it is a great simplification, not only because of the obvious fact that it is easier to treat of two things, copper ion and sulfate ion, than it is to treat of three things, these ions plus copper sulfate, but because it links up so perfectly with the newer knowledge of salt crystals. In fact, the ready acceptance of the revolutionary idea that molecules of certain electrolytes do not exist in solution is unquestionably closely related to the previous proof of the absence of molecules in crystalline salts.

No discussion of progress in the study of solutions can omit an acknowledgment of the great part in this progress which has been played by the work of G. N. Lewis. All modern investigations of solutions make use of exact thermodynamic methods for which he, more than any other, is responsible.

**Atomic Number.** A great increase in clarity and simplicity in fundamental theory has come with the introduction of the concept of atomic number and the identification of this with a fundamental and measurable property of the structure of the atom. Since Mendeleef, chemists have been interested in such relations of atoms of one kind to those of another as are represented by the periodic table. In particular, there has been much effort to represent the properties of the elements as functions of some sort or another of the atomic weight, for atomic weight is the most obvious and apparently the most characteristic and fundamental property of an element. The essence of the periodic table is indeed the principle of writing down the elements in the order of increasing atomic weight, and the value of the table lies in the fact that when the elements are written in this order there is a periodicity such that similar elements follow each other in an order regulated by definite laws. Rydberg in 1897 suggested, however, that a more fundamental number, by which to describe an element and to which to relate other properties, is obtained if the elements are written down in the order of increasing atomic weight, and a whole number is then assigned to each element in this order. Thus, hydrogen has the atomic number 1, helium 2, lithium 3, beryllium 4, boron 5, carbon 6, and so on. The properties of the elements are more simply and directly related to these atomic numbers than to atomic weights. Thus, the difference in atomic weight between successive elements is variable, sometimes small, sometimes large, whereas the difference in other properties from element to element in this order is about the same, like the whole number progression of the atomic numbers, and regardless of the difference in atomic weight. Atomic number nevertheless remained a somewhat vague concept, for there lacked any direct and simple method of determining it and any picture of the atom which accounted for its importance.

In 1914 Moseley in England supplied the method of determining atomic number and gave a strong indication of its meaning. The results of the Braggs had given not only a method of

determining the structure of crystals but also a method of measuring the wave length of X-rays, and had shown that an element emits an X-ray spectrum when it or its compounds are used as target for electron bombardment in an X-ray tube. Moseley now investigated the relation of these spectra to the nature of the element. He found that X-ray spectra are simple and that the frequency of the radiation increases in a regular way from element to element, the square root of the frequency being linearly related to the atomic number. In particular, the order of X-ray frequencies is the order of the chemical properties in the case of cobalt and nickel, where the order of chemical properties and atomic weights do not coincide. This one discovery gave a direct means of determining quantitatively the atomic number of an element, by determining the frequencies of its X-ray spectrum, and demonstrated conclusively that atomic number represents some fundamental property of the atom, rather than a chance order of arrangement. This fundamental quantity, Moseley said, can only be the charge on the central positive nucleus.

Moseley, to whom science owes these discoveries, was killed in the fighting at Gallipoli in his twenty-eighth year, "the youngest investigator surely to have won so secure a place in the history of science," says Soddy.

**The Bohr Theory.** Moseley's interpretation of atomic number as nuclear charge depended upon the Rutherford-Bohr atomic structure theory. Rutherford had been led by complicated considerations arising from alpha particle scattering experiments to the conclusion that the atom contains of a nucleus of dimensions much smaller than those of the atom, that the nucleus is positively charged, and that it includes practically the whole mass of the atom. Surrounding this nucleus are a number of electrons circulating in orbits which make up the greater part of the volume of the atom. Bohr attempted to treat the problem of stability of such a planetary structure by methods which make use of the quantum theory of radiation. His results have had marvelous success in the explanation of the physical properties of isolated atoms, that is, of the properties of elementary substances in the state of monoatomic gases at low pressures; and in the explanation of properties of atoms which, like X-ray emission and absorption, are little affected by chemical combination, and which are believed to depend upon interior portions of the atomic structure.

Moseley saw that the application of these methods of Bohr to the relation between X-ray frequency and nuclear charge must lead to just such a result as that which he had found for the relation between X-ray frequencies and atomic numbers. He was thus led to his conclusion that the physical meaning of atomic number is the number of unit or elementary positive charges on the nucleus.

**The Nuclear Theory of Atomic Structure.** These two principles, that the atom consists of a small positively charged nucleus surrounded by a number of electrons equal to the number of unit positive charges on the nucleus, and that the number of such unit positive charges is equal to the atomic number, have become foundation stones of physics and chemistry. Much corroborative evidence has appeared, and there are no known facts in conflict with these principles, but the strongest reason for accepting them and

the chief reason for their importance is that they clearly predict that the properties of elementary substances in general may be divided into two classes, those which depend upon the number and arrangement of the extranuclear electrons, and those which depend upon the nucleus. The properties such as melting points, boiling points, solubilities, energies of reaction, reaction velocities, spectra, and so forth, upon which reliance is placed for the identification of elements and their compounds, depend only upon the number, arrangement, and firmness of attachment of the extranuclear electrons. The forces controlling these properties of the exterior of the atom are purely electrical, and depend only upon the charge of the nucleus, and not at all upon its mass. Granted that nuclei can be identical in charge but different in mass, the existence of isotopes becomes immediately explicable. Furthermore, the close and regular relation between chemical and physical properties and atomic number receives a sound foundation, for these properties depend upon nuclear charge which is atomic number. That there is an approximate relationship between nuclear charge and nuclear mass appears, however, from the fact that the periodic table could have been developed in terms of atomic weights.

**The Discovery of New Elements.** Moseley's method of determining atomic number by determining X-ray frequencies can be reversed, and the X-ray frequencies which correspond to any particular atomic number can be calculated from that atomic number. This is particularly important, because it gives a new and most valuable method of searching for a new element. Thus, the element with the atomic number 72 was not known. Bohr predicted from his considerations on atomic structure that this element should resemble zirconium. In 1923 Coster and Hevesy at Copenhagen proved that element 72, which they named hafnium, is indeed present in zirconium minerals, and resembles zirconium closely in its properties. They were able to do this because the X-ray spectrum of this unknown element could be predicted quantitatively by the laws discovered by Moseley, and because no purification or separation is necessary in order to obtain an X-ray spectrum. Similarly Harris, Yntema, and Hopkins of Illinois could use X-ray spectra as corroborative evidence for their discovery of element 61, which they called illinium, and Noddack and Tacke in Germany proved the existence of elements 43 and 75 by X-ray spectra.

**Chemical Valence Theory.** The further development and amplification of the quantum theory of atomic structure at the hands of Bohr and other mathematical physicists is a matter of great interest to the chemist. Bohr has indeed used the rules of chemical valence with considerable success for verification and confirmation of his conclusions derived from quite different evidence. One may hope greatly for the improvement of valence theory from this kind of result, and improvement is needed. Chemical valence theory consists of a series of partial and incomplete generalizations, sometimes mutually contradictory, yet often extremely valuable in limited fields as the organic chemists' valence rules have been in the chemistry of carbon compounds, and as Werner's principles have been in inorganic chemistry. Even in these cases there has lacked any mechanism, any basis for the behavior described by the generalization.

The distinction between polar and non-polar

compounds has brought some clarity to this field, and the nature of extremely polar or salt-like compounds seems well settled. With these, a principle enunciated by Lewis in America and by Kossel in Germany rules. According to this, there is a particular stability about the arrangement and number of electrons in an inert gas atom, and other atoms lose or gain with relative ease a number of electrons necessary to leave them with the electron number of an inert gas atom. The fact that an inert gas forms no stable chemical compounds is to be related to the fact that its structure is of such inherent stability that there is very little tendency either to lose or to gain electrons; sodium is a monovalent metal because the loss of one electron leaves its atom with the same number of electrons as is possessed by the atoms of the inert gas neon; magnesium is a bivalent metal because its atoms contain 12 electrons, and can easily lose two electrons to form a doubly charged ion with the same number of electrons, 10, as the atoms of neon; chlorine is a monovalent non-metal because its atoms contain 17 electrons, whereas 18 electrons represent the stable configuration of the inert gas argon.

The why of the valence relationships in non-polar combination remains unsolved. Much may be hoped for from the further application of the quantum theory to molecules, especially in its newer developments. Yet there is still much to be done in the extension and clarification of the empirical rules of chemical valence. Thus, Stock of Berlin seems to have proven that the substance  $B_2H_4$  is so similar in structure and properties to  $C_2H_4$  that it must be concluded that boron is quadrivalent in the one case if carbon is in the other. Here is a result which is in direct contradiction to all previous chemical rules of valence and to all atomic structure theories yet proposed. That such a discovery could be made at such a late date in the history of chemistry is because of the difficulty of the experimentation and because there has been no indication of commercial usefulness for these compounds. Stock's achievement in separating complex mixtures of poisonous, spontaneously inflammable substances, gaseous at ordinary temperatures, and in purifying, analyzing, and studying the reactions and properties of the constituents of these mixtures marks a great advance in chemical methods. Every such accomplishment as this helps lay the foundation upon which a really complete and inclusive valence theory may some day be built.

**Structural Chemistry.** The development of organic chemistry with its tremendous practical applications has been founded upon the idea that the arrangement of atoms in molecules can be deduced from the chemical reactions of these molecules, and that the arrangement or structure once found can be used as a method of recording and of predicting the properties of a particular substance. The structure of a compound is determined by a study of chemical reactions, it is verified by chemical reactions, and it has been useful chiefly as a means of recording and predicting chemical reactions. To many thoughtful chemists, it has seemed doubtful whether any high degree of physical reality can be assigned to these structures, whether they represent any more than an immensely valuable shorthand or systematics for recording and classifying chemical reactions. The appearance of several methods which do not depend upon

chemical reactions for investigating the spacial arrangement of atoms is therefore especially important. That the results of these methods, in so far as they have been applied, agree completely with the conclusions of structural chemistry means that the basic assumptions of structural chemistry are much broader, more inclusive, and more real than a working hypothesis directed solely toward the end of the elucidation, the recording, and the classification of the reactions of carbon compounds.

Arrangement of atoms in space is exactly what X-ray analysis of crystal structure can determine. Unfortunately, the determination of crystal structure meets with especial difficulty in the case of organic compounds, and only a few such structures have been completely determined. Such results as have been obtained, however, are in agreement with the results of structural organic chemistry; but a considerable number of inorganic complex compounds have had their spacial configurations determined by this method with results which are in entire agreement with Werner's conclusions derived by the application of the fundamental methods of organic structural chemistry to the structure of inorganic complex ions. The verification of these chemically derived structures by this entirely different physical method is a great triumph for the methods of structural chemistry.

As was mentioned in the discussion of non-polar compounds, Debye has shown how the electrical symmetry or dissymmetry of a molecule can be estimated from the dielectric properties of the substances. The application of this method of investigation to the derivatives of benzene by Smyth and others has resulted in a perfect confirmation of the structures of the organic chemist. Compounds which the organic chemist says are symmetrical spacially are symmetrical electrically, compounds which the organic chemist predicts to be polar are found to possess molecules with an electric moment.

**Fields of Research.** There are a number of branches of chemistry which have been the subject of the most extensive investigations since 1914 without any definite or approximately complete answer to the problems concerned having yet been attained. In all periods in the history of science, there have been such active fields in which many new facts are discovered by painstaking research, in which the accumulation of new facts leads constantly to the breaking down of old, and the setting up of new, hypotheses, and the constantly changing hypotheses lead ever to new experiments which lead to the discovery of yet further facts. Through all this, there runs always a steady increase in the known facts and still more in the recognition of the relationships between known facts. Sooner or later, there comes a Faraday, a Pasteur, a Kekulé, or an Arrhenius to clarify the whole field with an idea and some crucial experiments. One cannot, during the heat of the struggle, assay properly the importance of this or that experiment or hypothesis, one certainly cannot predict the direction from which the answer is to be expected, for it is the essence of a difficult problem that the answer is to be found in an unexpected direction. For such fields, then, one can but state the existence of the activity, point out the reason for the interest, and pay due tribute to the value and importance of the efforts of the workers in the field. The study of reaction velocity and catalysis, photochemis-

try, and colloid chemistry can properly be classed under this heading of very active fields of research during the years since 1914.

**Reaction Velocity and Catalysis.** There are two chief aspects of the study of any chemical reaction. One is the question of the position of the equilibrium in the reaction, the question of how nearly complete the reaction will be if it is given unlimited time. The other is the question of the rate at which the reaction proceeds. The first is the problem of chemical statics, the second the problem of chemical dynamics. The ideal of chemical statics will be attained when it is possible to substitute in a mathematical formula certain numbers, say 11 and 17, and a temperature, say 25° centigrade, and to calculate therefrom with certainty the extent to which elements 11 and 17, that is sodium and chlorine, react with each other at 25° centigrade.

We are far from the attainment of this ideal, but we can see progress, we can see many regularities, many indications of the correctness of the methods of attack in use; and the usefulness of the tool of thermodynamics for the purpose is clear. The problem of chemical dynamics, however, the prediction *a priori* of how rapidly a given reaction will go, seems much further from realization. Reaction velocity seems to be a much more haphazard sort of thing, much less amenable to rule and generalization than does the extent of reaction. The substitution of one substance for another similar one in a reaction will, in general, produce a greater effect upon the velocity than upon the extent of a reaction. Furthermore, the velocity but not the extent of a reaction is often greatly affected by the presence of catalysts, substances which take no permanent part in the reaction, and which are present in the reaction products in exactly the same amount as in the reaction mixture.

Aside from its fundamental scientific importance, the problem of reaction velocity and catalysis is of enormous importance in the applications of chemistry. On the one hand, the success or failure of an industrial process depends upon whether the reaction concerned requires 10 seconds, 10 hours, or 10 years, and upon the extent to which a particular reaction can be made to proceed so much more rapidly than other competing reactions as practically to exclude these others. All of these technical problems are to be solved, if at all, by the discovery of catalysts. On the other hand, it becomes constantly more apparent that life processes are dependant upon the elaboration by the living organism of very specific catalysts, and that the study of the nature of such biological catalysts and of their mode of action is one of the most fertile methods of attacking the chemistry of living organisms. We have very much yet to learn about the mechanism of even the simplest chemical reactions, but we are learning.

As for catalysis, the efforts of pure scientists are being supplemented by the rapid discovery by the chemical industries of great quantities of empirical data about the selection and use of catalysts, information which will sooner or later become the common property of science.

**Photochemistry.** The study of the effects of radiation upon the extent and velocity of chemical reactions is called photochemistry. The recent great interest in this has been stimulated in part no doubt by the great success which the quantum theory has had in treating the emission

and absorption of light by atoms and molecules. Specifically, the quantum theory indicates that the subjection of matter to light of high frequency is in many ways analogous to its subjection to a high electric potential or to a high temperature, with the difference that there is at least the possibility that the radiation may be tuned, so to speak, to the particular reaction which is desired to the exclusion of competing reactions.

**Colloid Chemistry and Adsorption.** It was recognized by Graham in 1861 that solutions of starch, gelatine, gums, and such materials differ from ordinary solutions in the very small tendency to diffuse which the former possess. Further, a membrane of parchment or collodion, through which water and many dissolved substances, such as salts and sugar, pass easily, retains starch and other such materials completely or almost so. Solutions whose constituents diffuse very slowly and are retained by parchment or collodion membranes are called colloidal. It also has been found that many substances, such as hydrated ferric oxide and even metallic gold, which are in the ordinary sense insoluble, are capable under special conditions of forming solutions which have these colloidal characteristics.

Colloidal solutions have in general special optical properties. They scatter light strongly so that the path of a beam of light through such a solution is easily visible when viewed at right angles to the direction of the beam, whereas such a path is practically invisible in pure water or in a solution which is not colloidal. When the path of a powerful beam of light through such a solution is viewed by a microscope set at right angles to the beam so that only scattered light enters the microscope objective (this is called an ultramicroscope), individual spots of light are seen and each such spot is interpreted to represent the light diffracted by the individual particles which correspond to the molecules in ordinary solutions.

All these properties, both the optical properties and those relating to diffusion, indicate strongly that these particles are much larger than the molecules of non-colloidal solutions. Colloidal solutions represent, then, a link between ordinary solutions, on the one hand, and coarse suspensions and emulsions, on the other. The ultimate particles are either molecules of much greater size than the molecules of ordinary solutions, or they consist of many molecules of ordinary size united into particles which because of some special conditions of electric charge or combination with other constituents of the solution do not settle out or coalesce.

A closely related question is that of adsorption. There is sufficient theoretical reason to expect the fields of force and other properties of the surface of a solid or liquid particle to be very different from those inside the particle, and sufficient experimental evidence that small particles can attach and hold firmly on their surface molecules of gaseous or dissolved substances with which they come in contact. The relative surface of a material increases with its degree of subdivision, so that a very small particle can be thought of as being almost entirely surface. Adsorption, therefore, should increase as the degree of subdivision increases, and should be, and is, very great with particles which approach the dimensions of colloidal particles. The gross composition of a material composed

of such particles with their adsorbed matter must vary continuously since adsorption does not correspond to the formation of definite compounds, and for such materials the law of definite proportions does not hold. Instead of combining only in certain very definite proportions, an adsorbed material can be held in any proportion whatsoever within wide limits, and the properties of the product vary continuously with the proportion of adsorbed substance.

Colloidal solutions and adsorption have been known to exist for a long time, but activity in the field has been especially great since 1914. Aside from the fact that such border-line subjects are likely to be of particularly great importance in the growth of science, this branch has enormous practical importance. Living organisms are composed largely of colloidal material, and this means that physiology, medicine, and those branches of industrial chemistry which are concerned with the products of living organisms have much to do with colloidal chemistry.

**Organic Chemistry.** The fundamental assumptions of structural organic chemistry and its general methods of procedure have justified their usefulness over a period of so many years that it is hardly unexpected that there have been no extensive or fundamental overturns in these principles or methods in many decades. The support which the fundamental assumptions of structural chemistry have received from other fields has already been mentioned.

The developments of organic chemistry, then, have been either in the direction of refinement and extension of these fundamental principles, work of great importance but work which is of and for the specialist in the field, or they have been applications of the methods and results of organic chemistry. Organic chemistry represents a valuable technique at the service of other branches of science, and incidentally the one highly developed method of scientific reasoning which is not mathematical in nature. It is being used with a large and constantly increasing measure of success in the investigation of the products of living organisms, of proteins, sugars, enzymes, of natural drugs, perfumes, and coloring matters. The year 1928 saw the announcement by Pictet of Switzerland that sucrose, the common sugar of our tables, whether obtained from cane or beet, has finally been synthesized. To the organic chemist, this is a great step forward, for the classical method of organic chemistry with natural products consists first in the isolation of a substance in the pure state and its analysis; second in the derivation of a structural formula by the study of its reactions; and, finally, in its synthesis from simpler material. Without this final step, the problem of the structure is not felt to be solved with certainty; with it, the next thought has often been its possible artificial preparation more cheaply than it can be obtained in nature. The organic chemist has always gone further and prepared new substances different from any known in nature, some of which have become of great value. A constantly increasing list of purely artificial drugs, dyestuffs, and odorous substances testifies to his skill in this direction. See BIOLOGICAL CHEMISTRY; VITAMINS; ZOOLOGY.

**CHEMISTRY, APPLIED.** The World War focused popular and governmental attention upon a particular part of chemical industry, that of the organic dyestuffs. Before the War, this industry was confined largely to Germany, where support of research by the industry and by the Government had led to great advances. The great shortage, during the early part of the War, in the neutral and allied countries contributed much to the realization of the importance of this industry and of the extent to which dyestuffs and the related pharmaceutical substances interlace with every part of industrial life. Even more effective was the demonstration that an organic chemical industry is an indispensable school for the training of chemists, engineers, and executives for the production of all kinds of materials for war. (See **EXPLOSIVES**.) The existence of such an industry guarantees much of the preparation for that contest of scientific and technical wits which is an important part of modern war. If there is to be any preparation for national defense, if a country is to have armies and navies, the lack of a flourishing chemical industry is as fatal to this preparation as the lack of shipyards or of steel mills. Every great power now possesses such an industry, and protects it by tariff or embargo against foreign competition.

With several great national dyestuff industries existent and a market only slightly greater than that which was supplied by the Germans alone, it is not surprising that the period following the War has been a time of consolidation and of extension of the brains and knowledge of this industry to related fields. In Germany, for instance, practically all the chemical industry of the country is united in the *Interessen Gemeinschaft*, one of the most formidable industrial organizations the world has ever known. In this, however, the importance of heavy chemicals, of synthetic nitrogen compounds and other fertilizers, of products from coal and coal gas, of artificial silk, and of pharmaceuticals outweighs that of dyestuffs. The most significant developments of technical chemistry of the post-war period have been in these other fields both in Germany and elsewhere.

**Heavy Chemicals.** The dyestuff industry was never the greatest chemical industry in point of view of quantity or value of its products. It is the most chemical industry in the sense that it is the one in which continued chemical research has been most necessary and most immediately remunerative. There is hardly an industry, however, which is not to some extent chemical, in which chemical research may not be expected to be profitable.

At the bases of all industries which use chemicals is the heavy chemical industry, which manufactures such substances as sulphuric, nitric, and hydrochloric acids, sodium carbonate, sodium hydroxide, and the other common acids, alkalis, and salts. The chemistry of these processes of manufacture is relatively simple, it has long been known, and revolutionary changes are not to be looked for in every decade. There have been, however, decided trends in the period since 1914. More and more sulphuric acid is made by the contact process instead of by the older chamber process. The contact process produces directly acid of high concentration, and the plant requires much less space.

Transportation is and always has been a great problem with the heavy chemical industry. Many of its products have had to be shipped in fragile glass carboys, with great expense for handling in such small packages, and constant danger of loss from breakage. It represents, therefore, a great advance for the industry that an American company has developed a method of attaching a rubber coating so firmly and permanently to metal that rubber lined tank cars are now in service for the transportation of such corrosive chemicals.

**Nitrogen Fixation.** The greatest change in the heavy chemical industry is the increase in the extent to which supplies of nitrogen compounds are obtained from the nitrogen of the air. Nitrogen is a common element, four-fifths by volume of the air is nitrogen, but the elementary nitrogen of the air is inert and unreactive, and it is extremely difficult to make it enter into combination. Plants must have combined nitrogen, and except for the ability of certain bacteria present in the nodules on the roots of legumes to use the nitrogen of the air, this combined nitrogen must be supplied as fertilizer. Besides the demands for fertilizer, large quantities of nitrogen compounds are required for the manufacture of explosives, almost all of which are nitrogen compounds, of dyestuffs, and of nitrocellulose used for lacquers, for photographic films, and for plastics.

Before processes for the fixation of atmospheric nitrogen, that is, its conversion to some compound, were perfected, the world's supply of nitrogen compounds depended upon green manuring with leguminous plants, upon ammonia obtained from coal gas, and upon the limited and monopolized sodium nitrate of Chile. Several processes for the combination of the nitrogen and oxygen of the air were first developed, followed by the cyanamide process. These require large quantities of electric power, and are only possible when this is cheap.

In 1913 the first industrial plant for the production of ammonia by the direct combination of nitrogen and hydrogen went into operation at Oppau in Germany, and production has increased rapidly in all parts of the world. In this process, whose technical difficulties were first solved by Haber, nitrogen from the air is combined with hydrogen. This is usually obtained by the action of steam on hot coke, the water gas thus formed being subjected to various processes to remove the carbon monoxide and various harmful impurities. The combination takes place at an elevated temperature, which is maintained by the heat of the reaction, so that large expenditures of energy for heating are unnecessary. The pressures used range from 100 to 900 atmospheres, and the engineering difficulties which had

to be overcome in the construction of operating apparatus to withstand these temperatures and pressures were tremendous. The heart of the process is the catalyst, for which suitably prepared metallic iron is generally used. It is in connection with catalysts for ammonia synthesis that the now common term "promoter" was first used. It was found, namely, that the addition of small amounts of certain materials, called promoters, which are not in themselves catalysts, to the iron catalysts greatly increased the effectiveness of the catalysts. It has since been found that such behavior is common with contact catalysts.

In 1927 more than half of the world's consumption of combined nitrogen was satisfied by one or the other of the nitrogen fixation processes. It should be emphasized that combination of some sort is the essential thing. Either ammonia compounds or nitrates can be used as fertilizers, and ammonia mixed with air can be passed over a heated platinum gauze to give nearly quantitative conversion to oxides of nitrogen which can be converted to nitric acid and nitrates.

**The Chemical Utilization of Coal.** Coal is being looked upon more and more as a chemical raw material, less as a mere fuel. Coal is far from being the pure carbon which we often carelessly think it to be. If it is heated out of contact with air, destructive distillation takes place. The process has long been in use for two main purposes. The nearly pure carbon which remains after the distillation is called coke. It is a smokeless fuel, but even more important, it is the usual form of carbon for the reduction of iron oxide to iron in the blast furnace and for other metallurgical purposes. The gaseous products of the distillation after purification have been used for many years as gas for light and fuel. Because gas plants have had to purify their gas before distribution, they have always recovered a number of other products besides gas and coke. Among these are ammonia and coal tar, a complex mixture from which a large number of valuable chemical raw materials have been obtained.

Manufacturers of coke for metallurgical purposes were interested chiefly in the production of a coke of sufficient mechanical strength for blast furnace use, and such coke can be made in a simple apparatus, the beehive oven, in which none of the by-products of the distillation of the coal are saved. Before the World War, satisfactory by-product coke ovens which produced a useful coke, yet saved all the ammonia, tar, and other by-products, and used only part of the gas for heating the ovens, were in use, largely in Europe and to some extent in America. The War with its immense demands for coal-tar products, particularly for toluene for the manufacture of TNT, resulted in a great increase in the use of such ovens, and a decrease in the wasteful beehive oven. See COKE.

When coal is distilled at a temperature much lower than that used in ordinary coke-oven or gas-retort practice, quite different products are obtained. A greater proportion of liquid by-products is obtained and these are of quite different chemical nature from those of the classical coal tar. These low-temperature carbonization processes have excited much interest although none are yet in large-scale commercial operation. The conversion of coal into a liquid fuel with its greater ease of handling is an interesting prob-

lem. This has been attacked by Bergius who subjects coal to treatment with hydrogen for this purpose. The commercial possibilities of this process are being actively studied.

The outstanding achievement since the World War, both in the chemistry of coal products and in the application of catalysis, has been the discovery and successful commercial application of methods of obtaining complex carbon compounds from water gas. Water gas is essentially a mixture of carbon monoxide and hydrogen, which is prepared by passing steam over heated coke. In 1927 the catalytic preparation of methanol or wood alcohol from water gas was announced from Germany and France, and synthetic methanol soon came on the market. This struck a severe blow at the industry of wood distillation. This is an interesting example of the change in emphasis of a chemical process with a complex product. The destructive distillation of wood was first carried out for the sake of the charcoal, and no other product is obtained in primitive methods. It is possible, however, to obtain tar, methanol, and acetic acid, and methanol and acetic acid became the chief object of wood distillation when coke displaced charcoal for most purposes. Then, other methods for obtaining acetic acid appeared. This is now obtained where electric power is cheap from calcium carbide through acetylene and acetaldehyde, and is also prepared by the quick vinegar process from alcohol. Moreover, the acetone whose preparation represented an important use of acetic acid is now made together with butyl alcohol as a direct product of the fermentation of corn. The demand for methanol represented practically the sole reason why wood must be distilled in large quantities, and that compulsion has now disappeared.

From this same water gas, with a different catalyst and under different conditions, Fischer and Tropsch have prepared complex mixtures called synthol with a lower oxygen content and greater calorific value than methanol. These have possible usefulness as motor fuel. The preparation of a volatile motor fuel from coal and water gives mankind another reserve against the exhaustion of the petroleum supply.

**Petroleum and Natural Gas.** Petroleum is another natural product which was originally thought of simply as a fuel to be burned directly or after separation by distillation alone. It is now being more and more treated chemically either to make it more useful as a fuel, which corresponds to the conversion of coal into coke and gas, or used directly as a raw material for the preparation of solvents and other valuable products. Petroleum is a complex mixture composed chiefly of compounds of carbon and hydrogen. These are of varying composition and correspondingly of varying boiling points. For use in motor-car or airplane engines, only the more volatile and easily evaporated components of this mixture can be used. The separation by distillation of the crude petroleum yields gasoline in a volume less than a quarter that of the oil used, and distillation alone can do no more. It has been found, however, that if the higher boiling portions of the petroleum, from which the gasoline originally present has been removed, is subjected to high pressures and temperatures, it is decomposed, "cracked," with the formation of a highly complex mixture of which a considerable portion has the volatility and desirable fuel characteristics of gasoline. This product can be sep-

arated by distillation and the higher boiling material can be again cracked. In this way, it is possible to convert much the larger part of petroleum into gasoline. The first large plant for the manufacture of cracked gasoline started operations in 1913, and the process has been constantly increasing in use, so that in 1925 approximately one-quarter of the gasoline used was cracked. This is an important step in the conservation of fuel supply suitable for the light-weight internal-combustion engine.

Much gasoline also is obtained from natural gas which contains gasoline vapor in much the same way as air may contain water vapor. By compression and cooling, or by adsorption, this vapor may be largely recovered to give a gasoline of relatively high volatility. This has especial value, since it may be blended with gasolines of low volatility to give a mixture of satisfactory properties, thus rendering possible the inclusion of a greater proportion of the petroleum in the gasoline fraction.

**Anti-Knock Gasolines.** The general use of high-compression gasoline engines has been made possible by the study of the chemical properties of gasoline fuels. An internal-combustion engine is more efficient the more highly the fuel air mixture is compressed before the explosion. With gasoline, a limit is set to this increased efficiency by the appearance of knocking or pinking. This is due to violent and rapid combustion, to a detonation which gives a blow, instead of a slow explosion which gives a push, to the piston. Riccardo first showed the importance of knocking and its dependence upon fuel composition. Especially, he found that benzene and similar aromatic hydrocarbons which can be obtained from coal distillation do not knock even at high compressions, and that the addition of sufficient proportions of benzene to petroleum gasoline gave a knockless fuel. The available supplies of benzene, however, are too limited to make this method of suppressing knocking generally available.

Midgely in 1922 found that the addition of a fraction of 1 per cent of lead tetraethyl to gasoline entirely suppresses knocking. Methods of preparing this compound, which had been a laboratory curiosity, were developed on a large scale, and large quantities of gasoline using this substance are being sold. Further study of knocking has shown that what seem at first sight unimportant minutiae of the structure of a hydrocarbon exert enormous effects upon the tendency to knock when this hydrocarbon is used as fuel in an internal combustion engine. Branched-chain compounds have a very different action from straight-chain ones, unsaturated compounds from saturated ones.

The chemistry of these hydrocarbons has therefore become a matter of the greatest practical interest, and is being actively studied. We are no longer satisfied with the fact that all of these compounds burn, we must be interested in the way they burn. This we already know to be a complex chemical problem in which the methods of organic chemical research are of great value. It has already been demonstrated that the process of cracking can be modified to produce a greater proportion of the kind of hydrocarbons which tend to prevent knocking.

**Other Petroleum Products.** The cracking of petroleum produces considerable quantities of gaseous substances which contain ethylene, propylene, and other unsaturated compounds.

From the propylene, isopropyl alcohol is now being prepared on a large scale. This is a useful solvent, particularly because of the legal restrictions on the use of ethyl alcohol. A related product which has come onto the market in large quantities is ethylene glycol. This substance which resembles glycerine is being used as an "anti-freeze" for motor-car radiators, and as a raw material for the preparation of many interesting derivatives. Among these are glycol nitrate, from which low-freezing dynamites can be made, and various ethers which are odorless, high-boiling solvents for lacquers.

**Helium.** Hydrogen and helium are the only possible lifting gases for dirigibles. Hydrogen has the greater lifting power, but helium is non-inflammable and has a lifting power over 90 per cent that of hydrogen. Helium was discovered by Sir William Ramsay in 1895 as an extremely rare element. It is one of the inert gases, and its non-inflammability is simply one aspect of its chemical inertness. During the World War, it was discovered or recollected that certain natural gases contain helium in appreciable proportions. The Texas gas which is now being used for helium isolation contains about 1.75 per cent by volume of this formerly very rare element. Its isolation is simple in principle, although complex in its engineering. Helium has the lowest boiling point of any known gas, and it can be separated from the other constituents of natural gas by liquefaction and fractional distillation. The calorific power of the remaining gas is increased slightly by the removal of this non-inflammable constituent. So far as known at present, the United States is the only country which possesses natural-gas supplies with a helium content sufficiently large to make extraction practicable, and is therefore the only country which can take advantage of the great increase in safety of operation which the use of this gas makes possible for dirigibles.

**Flotation.** There are two decidedly chemical applications in the field of obtaining metals from their ores. Ores usually consist of a complex mixture of minerals, and conversion to the metal consists partly in the separation of these minerals, partly in changing one of these minerals, the true ore, to the metal of which it is a compound. Many methods of separating minerals have been used, but the introduction of flotation has helped to solve many difficult problems. In this process, the finely ground ore is suspended in water to which small amounts of flotation reagents have been added. Agitation and the introduction of streams of air result in the formation of a froth in which certain of the minerals are suspended, each particle attached to a bubble, whereas other minerals sink. The determination of which minerals go into the froth and which sink depends largely upon the nature of the addition agent, and by suitable choice very valuable results have been attained. This is undoubtedly a problem in colloidal chemistry, and in this, as in many applications of colloid chemistry, practice still outruns theory.

**Electrochemistry.** Electrochemistry has made great advances in the obtaining of metals by electrolytic processes or in the purification of metals by electrolytic means. Copper, lead, nickel, and zinc are now largely obtained or purified by these methods.

There has been great improvement in the status of electroplating in the direction of an

improved understanding of the empirically arrived at methods of the plater. Many old established methods have been improved by the application of this improved knowledge and the use of modern methods of physicochemical control. The importance and the nature of the action of hydrogen-ion concentration and conductivity of the plating solution are now well understood.

Two metals not previously used in commercial electroplating are now used very largely. Cadmium, hitherto thought of as a relatively rare element, is used as a corrosion-preventing coating on iron. Chromium gives an electrodeposit harder than the hardest file, more resistant to corrosion than any other deposit except gold, resistant to high temperature and most acids. The bluish cast of chromium is now often seen on the bright parts of motor cars. It was announced in 1928 that the difficult problem of electroplating upon aluminum has been solved. Such plated aluminum should be more valuable because of increased resistance to corrosion and better appearance.

**Lacquers.** Lacquers consisting essentially of a solution of nitrocellulose in volatile solvents have been known and have had valuable applications for a long time. The related cellulose-acetate lacquers, which leave a film of much lower inflammability than those of nitrocellulose but are more expensive, came into prominence during the World War as "dope" for airplane wings. The fabric covering of the wing is fastened tightly over the framework and painted with a cellulose-acetate or nitrate solution. The great shrinkage which these materials undergo on drying produces a taut smooth surface.

These lacquers have the great advantage of very rapid drying. They dry solely by evaporation of a solvent, whereas oil varnishes and enamels dry by chemical reaction with the oxygen of the air. While it is possible to increase the rate of this oxidation of the oil film by adding catalysts, called driers, these driers tend also to accelerate the further oxidation which leads to the deterioration of the varnish film. This sets a limit to the rate of drying which can be attained. The drawback which long prevented more general use of nitrocellulose lacquers was the high viscosity of nitrocellulose solutions. A solution containing 5 per cent of nitrocellulose was about as viscous as could properly be applied with a brush or spray gun. It has lately been discovered in America that it is possible by modifications in the method of preparation of the nitrocellulose to obtain a product which gives a satisfactory consistency for application when the concentration is as high as 22 per cent. This means that less than a quarter as much solvent is needed for the application of a given amount of coating, and furthermore that a decreased number of coats are necessary because each coat leaves a thicker deposit. Both of these represent large savings in the cost of application. Further improvements, notably in the addition of resins, have led to the almost universal use of lacquers instead of oil enamels in painting automobile bodies.

**Solvents.** A most important part in the properties of any lacquer of this sort is played by the high-boiling solvents. These have a boiling point appreciably higher than that of water, they evaporate slowly, and they remain longer than any water which may be absorbed from the atmosphere during the evaporation of the more volatile solvents, and which might other-

wise destroy the tenacity and useful properties of the film. Before the World War, amyl acetate prepared from the amyl alcohol of fusel oil, a by-product of the distillation of alcohol and of distilled liquors, was available in sufficient quantities to supply the limited demand for nitrocellulose lacquers. The present demand, however, is much too large to be supplied from this source. Synthetic amyl acetate is now available, and a large part of the lacquers have been made with butyl acetate prepared from fermentation butyl alcohol.

The butyl alcohol acetone fermentation process is interesting as the one new application of fermentation to the preparation of chemicals, for the preparation of alcohol and acetic acid goes back to the mists of antiquity. Its history is an interesting example of the shift in emphasis of a chemical industry. There has long been interest in synthetic or artificial rubber, a problem which is not yet solved technically, and it was early realized that the demands for rubber are so great that the raw material from which it is to be made must be available in very large quantities. An artificial rubber can be made from butyl alcohol, and research directed toward the production of butyl alcohol resulted just before the World War in the discovery of a micro-organism which could be used for the commercial production of butyl alcohol from such starchy materials as corn. There are also obtained in this fermentation about one-half as much acetone as butyl alcohol, smaller amounts of ethyl alcohol, and large quantities of hydrogen and carbon dioxide.

During the War, there arose a vast demand for acetone which is used in the manufacture of smokeless powder, and as a solvent for airplane dopes. This fermentation process was therefore put into operation on a large scale for the sake of the acetone, the butyl alcohol being an embarrassing by-product. Now, however, both butyl alcohol and acetone are in demand as lacquer solvents. Furthermore, the bran and germ of the corn are saved for the preparation of oil and stock feed, and the hydrogen and carbon dioxide are used for the catalytic production of methanol. Altogether, this represents a beautiful example of by-product utilization.

**Farm Products.** This chemical conversion of corn to solvents offers another outlet to the products of agriculture besides the traditional one of food. It accomplishes the same end as diversification of crop. The development of chemical methods for the use of such by-products of agriculture as straw and cornstalks is exciting much interest and is being actively investigated. Straw and cornstalk paper is an interesting commercial possibility of the future if not of the present.

**Artificial Resins.** There has been a steady growth in the use of artificial resins. Baekeland discovered that combination of phenol and formaldehyde under proper conditions can be made to give a product which first softens and takes the impression of a mold when subjected to heat and pressure, but then hardens to an insoluble infusible product while the temperature is still high. For accurate molding processes, this is a great advance over the use of a plastic material of the ordinary sort which softens when heated and stays soft as long as the heat is maintained. Other types of artificial resins prepared from other raw materials also are being actively investigated.

**Rubber.** Great improvements have been made in the use of rubber. Vulcanized rubber is prepared by heating rubber and sulphur together, but no rubber product consists of these two substances alone. It was at first thought that the more rubber the better the product under all conditions, but it has been gradually realized that the carbon black, magnesia, zinc oxide, and other powdered materials which are always added are not merely fillers whose sole purpose is to save expense, but that they may exert a very favorable action upon the finished product. For one purpose, say tire treads, where resistance to abrasion is extremely important, one type of mixture gives a product much better than any pure rubber sulphur mixture could be, for another purpose a quite different mixture is desirable. Another important advance is the discovery of methods for the increased use of reclaim, that is, of rubber which has already been vulcanized and used once.

The introduction of accelerators, substances usually complex organic compounds, which exert a catalytic effect upon the process of vulcanization, is a great advance in rubber technology. Vulcanization now becomes possible at much lower temperatures or in shorter times than was possible before, and is under better control. The scientific work of Moureu in France has focussed attention upon the frequency of negative catalysis in the reactions of oxygen. Thus, it is found that benzaldehyde reacts rapidly with oxygen when pure, but that the addition of minute fractions of 1 per cent of certain substances reduces the velocity of the oxidation nearly to zero. This idea has been applied to the prevention of the deterioration of rubber, which is to a large extent the result of reaction with oxygen, and a number of rubber anti-oxidants are on the market. See RUBBER.

**Glass.** Before the World War, the special glass required for laboratory purposes was made in Germany alone. Such glass must have a very low solubility in water and chemical reagents, a property which is not possessed to a sufficient degree by ordinary glass. There has been developed in America, however, a glass which is the equal of the best previously known resistance glass in resistance to the action of water and reagents, and has in addition so low a thermal expansion that breakage due to temperature changes is greatly decreased. In addition, this low coefficient makes possible the manufacture of apparatus with a thicker wall, and this decreases the breakage from mechanical shock. This glass is used not only for laboratory apparatus, but also for household cooking ware and for many other purposes. Altogether, it is a major contribution of American technology.

The discovery of the importance to animal life of the ultra-violet light from the sun has led to the investigation of the ultra-violet transmission of glasses. Ordinary window glass is opaque to the therapeutic ultra-violet, but it has been found that suitable attention to the materials used in glass makes it possible to manufacture a glass which is transparent to these radiations.

York, 1920); ib., *Snapshots of Science* (New York, 1928). Consult also *Annual Survey of American Chemistry*, and *Chemistry in the Twentieth Century*, referred to under CHEMISTRY. See PHOTOGRAPHY.

**CHENEY, SHELDON WARREN** (1886- ). An American author born at Berkeley, Calif., who founded the *Theatre Arts Magazine* in 1916 and edited it until 1921. He was associated with the Equity Players, 1922-23. His most important recent books on the theatre include *The New Movement in the Theatre* (1914), *The Art Theatre* (1917), *The Open Air Theatre* (1918), *Modern Art and the Theatre* (1921), *A Primer of Modern Art* (1923), and *Stage Decoration* (1927).

**CHERAU, shâr'-ô, GASTON** (1874- ). A French writer, born at Niort (Deux-Sèvres), France. He was the author of realistic novels in the manner of Flaubert, but his treatment, while characterized by the same minute observation, was less convincing than that of his model. His works have the atmosphere of Vendée. In *Champi-Tortu* (1906), he attempted a novel of childhood, but succeeded less well than some of his contemporaries in creating a type. His works include: *Les grandes époques de M. Thébault, Essai de psychologie bourgeoise, I* (1902); *La saison balnéaire de M. Thébault, Essai de psychologie bourgeoise, II* (1902, 1919); *Monseigneur voyage* (1903, 1910); *Le part du feu* (1909); *La prison de verre* (1911, 1912); *Le monstre* (1913); *L'Oiseau de proie et le remous* (1913); *Valentine Paquaault* (1920); *La maison de Patrice* (1924); *Le flambeau des Riffault* (1925); and *Le vent du destin* (1926).

**CHERRY, CHARLES** (1874- ). An English actor born in Greenwich, Kent. He made his début at 18 and played for several years in England with John Hare. In 1899 he came to the United States and acted with Henrietta Crosman, Elsie de Wolfe, Mary Mannering, and Maxine Elliott. He starred in: *The Bachelor*; *The Spitfire*; *The Seven Sisters*; *Thy Neighbor's Wife*; *Scandal* (1920-21); *The Tyranny of Love* (1921); *The Dover Road* (1921-22); *Success* (1923); *The Camel's Back* (1923); and *The Pelican* (1924).

**CHESAPEAKE AND DELAWARE CANAL.** See CANALS.

**CHESS.** An unusually large number of international chess competitions are now being held annually at Berlin, Vienna, Budapest, The Hague, and other capitals. Recent winners of these various tournaments have been R. Reti of Czechoslovakia, A. Nimzowitsch of Germany, J. R. Capablanca of Cuba and World's Champion, 1921-1926, Alexander Alekhine of Russia, World Champion in 1927, and Dr. S. Tartakower of France. E. D. Bogoljubow of Germany is another master who has figured prominently in these international competitions, challenging the champion in 1928. In the United States, local tournaments are held, as well as annual intercollegiate and club contests.

**CHESTER, COLBY MITCHELL** (1844- ). An American naval officer (see Vol. V.) In 1917, he became professor of naval science at Yale University, and was superintendent of the naval units of Yale and Brown Universities until April, 1919. He was president of the Inter-Ocean Engineering Company and negotiated concessions for the construction of railroads and the development of mines and oil wells in Turkey. These concessions later were canceled by the Turkish government.

**CHESTER, GEORGE RANDOLPH** (1869-1924). An American writer (see VOL. V). In collaboration with his wife, Lillian De Rimo Chester, he wrote: *The Ball of Fire* (1914); *Cordelia Blossom* (1914); a dramatization of *Cordelia Blossom* (1914); *Runaway June* (1915); *The Enemy* (1915); and *Wonderful Adventures of Little Prince Toofat* (1922). He was a frequent contributor to the *Saturday Evening Post*.

**CHESTERTON, GILBERT KEITH** (1874- ). An English author (see VOL. V). He made a lecture tour of the United States in 1921. His works since 1914 include: *The Flying Inn* (1914); *The Wisdom of Father Brown* (1914, 1921); *Poems* (1915); *The Crimes of England* (1915); *A Shilling for My Thoughts* (1916); *A Short History of England* (1917); *Irish Impressions* (1919); *The Superstition of Divorce* (1920); *The New Jerusalem* (1920); *The Uses of Diversity* (1921); *The Erils of Eugenics* (1922); *What I Saw in America* (1922); *The Ballad of St. Barbara, and other Verses* (1922); *The Man Who Knew too Much, and Other Stories* (1922); *Tales of The Long Bow* (1925); *The Everlasting Man* (1925); *William Cobbett* (1926); *The Incredulity of Father Brown* (1926); *The Return of Don Quixote* (1927); *Robert Louis Stevenson* (1927); *Generally Speaking* (essays, 1928); *The Judgement of Doctor Johnson*, a play (1928); and *The Poet and The Lunatics*, short stories (1929).

**CHESTNUT BLIGHT.** See PLANTS, DISEASES OF.

**CHETWODE, GEN. SIR PHILIP WALHOUSE, SEVENTH BARONET** (1869- ). A British soldier, educated at Eton, who rose to the rank of colonel in 1912, brigadier general in 1914, major general in 1916, and general in 1926. He served in Burma and South Africa and during the World War commanded cavalry in France, the Desert Corps in Egypt, and the 20th Army Corps under General Allenby in the Palestine and Syrian campaigns. He was military secretary at the War Office (1919-20); deputy chief of the Imperial General Staff (1920-22); adjutant general to the Forces (1922-23); commander-in-chief of the Aldershot Command (1923-27); and after 1928 chief of the General Staff in India. He was made a Knight Commander of the Bath in 1918.

**CHETWOOD, CHARLES HOWARD** (1869- ). An American surgeon and urologist, born at Elizabeth, N. J. He was graduated in arts at Princeton and in medicine at Bellevue Hospital Medical College (1887), became professor of genito-urinary surgery in the New York Polyclinic in 1897 and was secretary of the faculty (1903-09). His principal work, *The Practice of Urology*, which ran through four editions, appeared in 1913. For many years, Dr. Chetwood has made contributions on a special condition of the bladder neck, sometimes called "Chetwood's disease," in which there are the symptoms of obstruction yet no mechanical obstruction to the passage of instruments.

**CHEVALIER, she-vá'lyá', ALBERT** (1861-1923). An English actor, music-hall singer, and composer of "Coster" songs (see VOL. V). In 1916 in London, Mr. Chevalier played Eccles in *Caste*. One of his notable characterizations was Joe Brown in *My Old Dutch*, a production which he wrote with Arthur Shirley in 1916 and with which he toured repeatedly, from 1916 to 1920.

**CHEVRILLON, shē-vrē'yón (LOUIS) ANDRÉ** (1864- ). A French writer, a nephew of Taine, who chose England and the Orient as objects of study. He was born at Ruelle (Charente), and educated at the University College School (London), the École Alsacienne (Paris), the Lycée Louis-le-Grand, and the University of Paris. He was professor of English at the École Navale de Brest in 1887-88, and from 1889 to 1894 was *maître de conférences* at the Faculty of Letters of the University of Lille. He was with the British Army at the front during the World War, and afterward (1921) was received in the French Academy. His writings fall into two distinct classes: impressions of travel, and critical essays on England and English literature. Besides many articles in the *Revue de Paris* and the *Revue des deux mondes*, his works include: *Dans l'Inde* (1891; English translation, *Romantic India*); *Sydney Smith et la renaissance des idées libérales en Angleterre au XIX<sup>e</sup> siècle* (thesis, 1894); *Terres mortes* (1897); *Études anglaises* (1901); *Un crépuscule d'Islam* (1906); *Nouvelles études anglaises* (1910); *L'Angleterre et la guerre* (1916; English translation, *Britain and the War*, with a preface by Rudyard Kipling); *Près des combattants* (1918); *Marrakech dans les palmes* (1919); *Les Américains à Brest* (1920); *Trois études de littérature anglaise* (Kipling, Shakespeare, Galsworthy), (1921; English translation, 1923); *Sanctuaires et paysages d'Asie* (1920); *L'enchanement breton* (1925); *Derniers reflets à l'occident* (1925); and *Les puritains du désert* (of Southern Algeria, 1927).

**CHIANG KAI-SHEK** (?- ). President of the Nationalist, or Nanking, government of China and an army officer whose generalship was largely responsible for its establishment during the civil wars of 1926-28. He was elected President Oct. 9, 1928, by the Central Executive Committee of the Nationalist party, after the territorial and political unity of the country had been virtually achieved by the overthrow of opposing northern war lords and the capture of Peking and Tientsin. See CHINA, under *History*.

**CHICAGO.** The second city of the United States. The population rose from 2,189,520 in 1910, to 2,701,703 in 1920, and to 3,157,400 in 1928 by estimate of the Bureau of the Census. The Negro population increased 155 per cent, from 44,103 in 1910 to 112,536 in 1920. The area is 208.6 square miles. The metropolitan district, as officially defined, comprises the counties of Cook, Kane, DuPage, Lake, and Will in Illinois and Lake in Indiana and has a total area of 3396 square miles.

Since 1909 the development of the city according to the plan of the Chicago Plan Commission has been in process. The cost of 12 city-planning improvements between 1909 and 1920 totaled more than \$230,000,000, including bonds voted to the amount of \$61,500,000 and \$8,000,000 of special assessments on property directly benefited. In 1927 a bond issue of \$3,700,000 for the construction of the Wabash Avenue Bridge across the Chicago River and another of \$15,000,000 for the construction of the Town Hall were approved. A zoning commission, headed by the city commissioner of buildings, was appointed in 1921. Two years later, the city adopted four classes of use and five of volume districts, the latter type being a combination of the more usual height and area districts.

Roosevelt Road, one of the important street improvements, was completed from Ashland Avenue to Michigan Avenue, the street being widened for two miles of its length from 66 to 108 feet at a total cost of \$4,500,000. Michigan Avenue was widened to 130 feet its entire length to the river, and carried on in a straight line via a new drawbridge supplanting the narrow Rush Street Bridge into Lake Shore Drive, north of the river. The bridge and approaches were built on two levels. The cost of this improvement was \$13,115,558, of which amount about \$8,000,000 was for the bridge. The bridge houses have been embellished by four groups of sculpture. The two groups on the south pylons, which are the work of Henry Hering, are entitled "Defense" and "Regeneration," the one commemorating Fort Dearborn and the Massacre of 1812 and the other the great Chicago fire of 1871. The groups to be placed on the north pylons, which are the work of Earl Fraser, are entitled "The Pioneers" and "The Discoverers" and commemorate Chicago's early history. The Wacker Drive improvement on the northern boundary of Chicago's central business district was completed in 1926. Two levels have been provided. The upper level, which is 110 feet wide, is for general traffic, and the lower level, which is 135 feet wide, is for the exclusive use of heavy, commercial traffic which can pass six abreast, three lines in one direction and three in the other, without interruption from cross traffic.

Two extensive railway terminal developments, involving a total expenditure by the railroad companies of some \$163,000,000, have been going forward in line with the plan of Chicago. The Union Station, which cost \$75,000,000 to erect, is completed. The other project is that of the Illinois Central Railroad. Electrification of this railroad's suburban service has been completed, and plans were being developed for the erection of a new \$88,000,000 terminal to accommodate the 13 railroads using three different south side stations. Chicago is the largest railroad centre in the West, 38 railroads, including 23 trunk lines, terminating there. Freight traffic in and out of Chicago consists of about 21,000 cars per day; 4501 industries are served by private side tracks. Beneath the streets of Chicago's business district are 61 miles of freight tunnels, electrically operated, connecting railroad freight stations and 60 factories, warehouses, stores, and office buildings, thus eliminating trucking. In 1929 the Chicago & Northwestern Railway constructed a \$2,000,000 freight station on the site of its old passenger terminal at Wells Street, with a capacity for handling 10,000 tons of freight daily. The air rights were sold to Marshall Field & Co. which were to erect over the terminal an 18-story Merchandise Mart costing \$30,000,000. Chicago's rapid-transit service operates 1850 cars over 227 miles of track and carries 227,000,000 passengers annually. The Chicago surface lines operate 3639 cars over 1080 miles of single track and carry 882,000,000 passengers annually.

Chicago has an extensive system of parks and boulevards, the park area within the city limits being 6446 acres. More than 200 acres have been added to Lincoln Park on the north by filling in the Lake Michigan shore. The project cost \$1,875,000, but the land so made is estimated to be worth \$15,000,000. The south shore development from Grant Park to Jackson Park,

consisting of a park 1138 acres in extent, 6 miles long and varying in width from 1100 to 4000 feet, is being carried out. Within this park there will be a lagoon 6 miles long, 600 feet wide, and covering an area of 343 acres. The development will include also playgrounds, golf courses, yacht harbors, driveways, walks, picnic grounds, tennis courts, and other forms of outdoor recreation and has required the issuance of \$52,000,000 of bonds.

The Field Natural History Museum has been built at the southern end of Grant Park at a cost of \$6,000,000 as the first step in the development of this space as an educational centre. One of the principal features is a terrace, 40 feet wide and 6 feet high, which has a retaining wall, steps, and balustrade of the same marble as the building proper. Soldiers' Field, an athletic stadium seating 65,000, has been erected south of the Field Museum. The Fine Arts Building in Jackson Park has been restored at a cost of \$5,000,000 and will house an industrial exhibit, inspired by the industrial museums of Munich and Vienna and made possible by the gift of \$3,000,000 from Julius Rosenwald. Chicago is to have a large aquarium as a result of the gift of \$3,000,000 from the late John C. Shedd. The aquarium, which will form part of the lake-front development, will be 300 feet in diameter and will have an octagonal dome 100 feet high. The Morton Arboretum, founded in 1921 by Joy Morton on his estate at Lisle, is being developed into one of the largest arboreta in the United States. The Chicago Zoological Park is being organized on a 196-acre tract near Riverside. Plans include a goat hill 100 feet high, beautiful fountains, landscape gardening, an artificial lake, and many other features that will give the animals natural surroundings.

Thirteen steamship lines serve the port of Chicago, which has 101 miles of water front, 52 miles of which are equipped with dock and railroad facilities. A municipal pier 3000 feet long and 292 feet wide, with 8500 feet of dockage, was completed in 1916. Railroad tracks and warehouses for convenience of shipping and trolley tracks extend the length of the pier. A rock-filled pile breakwater, 2350 feet long, protects the pier from heavy weather on the lake and has been so built that it can be used as the dock walls of other piers and can be extended as required when additional commerce makes such action necessary. The Chicago municipal airport is one of the finest in the United States. It has an area of 320 acres, about half of which has been improved; and negotiations are under way to have the Belt Line Railroad, which bounds the north side of the field, moved further to the north to make available another 320 acres. Chicago is the terminus for seven air-mail routes. There are 19 smaller commercial, municipal, and military airports and landing fields; exclusive of auxiliary fields, and eight aircraft manufacturers are located in the metropolitan area.

There are 46 industrial districts in Chicago, comprising an area of 6855 acres. In 1925 there were 9112 manufacturing establishments employing 370,041 persons and paying \$563,634,650 in wages, according to the U. S. Census of Manufactures; the value of products manufactured, was \$3,439,163,391. During the past few years, Chicago has undergone an extensive building transformation. The year 1926 witnessed the construction of 1560 stores and factories, 130 of

fice buildings, 7415 single residence, 51 churches, halls, and theatres, 4523 apartment buildings, and 562 miscellaneous buildings. During 1927, 12,025 permits were issued for buildings at a cost of \$352,936,000. Two outstanding buildings are Tribune Tower, the home of the Chicago *Tribune*, erected in 1923 at a cost of \$7,000,000 and the Chicago Daily News Building, erected in 1929 at a cost of \$13,000,000. The latter was the first structure to use the "air rights" above the city's railroad tracks and was also the first building to utilize the elevated sidewalk arcade in an effort to solve the complicated pedestrian-traffic problem. The assessed valuation of property in 1927 was \$4,250,438,000; the net debt was \$241,700,000. Chicago has 3490 miles of streets within the city limits, of which 2550 miles were paved at the end of 1927. Ten pumping stations pumped more than 330,000,000 gallons of water through 375 miles of water mains during 1927. The typhoid fever death rate is the lowest in the United States for any city over 500,000 population. Chicago is the home of the Federal Reserve Bank of the seventh district and its bank clearings in 1928 totaled \$37,842,400,000. The Chicago public-school system includes 290 elementary, 14 junior high, 24 high, and 1 normal schools. The public-school enrollment during 1927 was 522,904. In addition, 137,958 students attended denominational schools. The ten major colleges and universities in Chicago were attended during 1927-28 by 47,000 students. In 1920 the city increased the number of city wards from 35 to 50, but reduced ward representation on the city council from two to one, thus cutting the council membership from 70 to 50.

**CHICAGO, UNIVERSITY OF.** A coeducational institution at Chicago, Ill., founded in 1890, largely through the gifts of John D. Rockefeller, although additional millions in contributions were subsequently received from other sources. The enrollment of students grew from 744 in the year 1892-93 to 7781 in 1914-15, and to 8108 in the autumn quarter and 6342 in the summer quarter of 1928. The number of members on the faculty, above the rank of assistant, increased from 274 in 1914-15 to 755 in 1927-28. The bound volumes in the libraries increased from 458,616 in 1914 to approximately 800,000 in 1928; and in addition, it was estimated that there were available about 400,000 unbound volumes and pamphlets. The productive funds increased, between 1914-15 and 1927-28, from \$18,598,275 to \$43,400,000; and it was estimated that the total resources of the University, including funds held as agent and funds held temporarily, were in excess of \$77,800,000. The University and affiliated institutions in 1928 occupied over 65 buildings for educational purposes and 196 acres of land, including the site of the Yerkes Observatory at Williams Bay, Wisconsin.

Numerous gifts and bequests were made to the University during the period under review, including the property, with an estimated value of \$1,500,000, deeded in 1918 by LaVerne Noyes, to constitute the LaVerne Noyes Foundation, the income to be used to pay tuition fees for deserving students who had served in the Army or Navy of the United States in the World War, or for their descendants. In 1925 work was begun on the construction of the Albert Merritt Billings Hospital and in following years large sums were added to the Frank Billings Medical

Endowment Fund. The Divinity School in 1916 received an anonymous gift of \$200,000 for buildings, and this sum was later augmented by a gift of \$150,000; and in 1925 by \$1,000,000 from John D. Rockefeller, Jr., as additional endowment for the school. In the same year, \$500,000 was received from the Wieboldt Foundation for a modern language building and \$1,000,000 from Douglas Smith for the endowment of medical research, the income to be used for the investigation of the causes, nature, prevention, and treatment of disease. In the autumn of 1925, the University engaged in a campaign to raise \$17,500,000 for the endowment and new buildings, and by October of that year had raised over \$6,000,000 of the amount. The University Chapel, seating about 2000, was begun in 1925 and completed in 1926. In the latter year, the grand-stands at Stagg Field were enlarged to accommodate 48,000 spectators; the Carnegie Corporation granted \$1,385,000 for the establishment of a graduate library school; and the total outlay for the construction of buildings approximated \$8,500,000, while the sum expended for the same purpose in 1927 was over \$8,000,000. In 1927 George Herbert Jones contributed \$665,000 for the erection, equipment, and maintenance, of the George Herbert Jones Laboratory, for the department of chemistry; Col. John Roberts gave \$1,000,000 for the erection and maintenance of a hospital to be known as the Bobs Roberts Memorial Hospital for children; in 1928 contributions to the Frank Billings Medical Endowment Fund totaled \$401,923; Mr. and Mrs. Albert D. Lasker gave \$1,000,000 to endow a programme of medical research into the causes, nature, prevention, and cure of degenerative diseases common to middle age; John D. Rockefeller, Jr., pledged \$15,000 a year for five years for the expenses of the Oriental Institute; and Mr. Julius Rosenwald gave a total of \$500,000 in two equal sums for the departments of physics, mathematics, and astronomy, and to the building fund of the Chicago Lying-in Hospital and Dispensary. Robert Maynard Hutchins, LL.D., was elected president in 1929.

**CHILD, CHARLES MANNING (1869- ).** An American zoologist born at Ypsilanti, Mich. He was educated at Wesleyan University (Ph.B., 1890; M.S., 1892), and at the University of Leipzig (Ph.D., 1894). He was assistant in biology at Wesleyan University (1890-92); and assistant in zoology (1895-96), associate (1896-98), instructor (1898-1905), assistant professor (1905-09), associate professor (1909-16), professor (1916- ), at the University of Chicago. Besides numerous articles in zoological journals, he published *Senescence and Rejuvenescence* (1915); *Individuality in Organisms* (1915); *Origin and Development of the Nervous System* (1921), and *Physiological Foundations of Behavior* (1924).

**CHILD, RICHARD WASHBURN (1881- )**. An American author and diplomat, born at Worcester, Mass., and educated at Harvard University. He was engaged in the practice of law during the period 1906-17. In 1917-18 he was employed in the United States Treasury on problems of war finance. In 1919, he became editor of *Collier's Weekly*. He was American Ambassador to Italy, 1921-24. In 1922 he represented the United States at the Conferences at Genoa and Lausanne. He wrote: *Jim Hands* (1910); *The Man in the Shadow* (1911); *The Blue Wall* (1912); *Potential Russia* (1918); *Vanishing Man* (1919); *Velvet Black* (1920); *The Hands of Nara* (1921); *Fresh Waters* (1924); *A Diplomat Looks at Europe* (1925); and *Battling the Criminal* (1925).

**CHILD LABOR.** The movement for the restriction of the labor of children in industry has been vigorously carried on in the United States since 1914 and, while no outstanding successes could be reported, there can be no question that there was much to hearten the friends of the movement. Federal action had definitely to be abandoned; a number of States were slow to adopt even elementary reforms and were lax in the administrative enforcement of the laws on their statute books; but the manufacturers employing child labor were plainly put on the defensive and the intelligent efforts of the National Child Labor Committee were making their mark in the creation of a favorable public opinion. Too, the patient researches of the Children's Bureau of the U. S. Department of Labor and the propaganda carried on by the American Federation of Labor were helping to illumine many dark corners. The period of the World War had seen the relaxation of the vigilance of the administrative officers with the result that an unusual number of work permits for children was granted; but the economic depression that set in with the end of 1920 brought a movement back to the schools and, despite such setbacks as the upsetting of the Federal Child Labor Tax Law and the defeat of all efforts generally at Federal control, there was no concerted attempt to lower standards.

**Statistics.** Over the period 1910-1920, the number of children gainfully employed decreased markedly. In 1910 there were 1,990,225 children from 10 to 15 years, inclusive, gainfully employed in industry; by 1920 the figure had dropped to 1,060,858, or a decrease of 46.7 per cent. In the same decade, the child population had increased 15.5 per cent. Thus, in 1910, 18.4 per cent of all children were gainfully employed, as against a proportion of 8.5 per cent in 1920. This decline was to be found in all industries. In 1910 there were to be found 1,432,428 children in agriculture; by 1920 the figure had dropped to 647,309. In mining activities, there were 18,090 children in 1910 and 7191 in 1920. In domestic service, there were to be found 112,157 children in 1910 and 54,006 in 1920. In manufacturing and mechanical industries, there were being employed 260,944 children in 1910 as against 185,337 in 1920. In clerical occupations, the number increased from 71,001 to 80,140 in 1920.

It is of interest to note that more than one-third of the 1,060,858 child workers in 1920 were under 14, the legal age for factory employment in 45 States at the time of the taking of the census. The failure of the State child-labor laws to prevent this widespread employment of

children was to be attributed to the numerous exceptions permitted by many of the State laws as well as to the inadequate enforcement of their provisions. It is impossible to give more than estimates for the extent of child labor for the period following 1920. The National Child Labor Committee, in 1926 during the period of agitation for the ratification of the Federal Child Labor Amendment, placed the figure at 2,000,000. Another source, estimating on the basis of child population and school attendance, put the number of children between 7 and 15, inclusive, gainfully employed at 3,000,000 and the number of children between the ages of 7 and 18 at 5,800,000. The American Federation of Labor reported that the following States had the largest number of child workers between the ages of 10 and 15 inclusive: Georgia, 89,000; Alabama, 84,000; Texas, 81,000; Mississippi, 70,000; South Carolina, 64,000; North Carolina, 62,000; Pennsylvania, 56,000; New York, 50,000.

**Federal Action.** The period saw the complete defeat of all efforts to end child labor by the action of the Federal Government. Early in 1916 the Keating-Owen Bill was passed by both houses of Congress and became a law on Sept. 1, 1917. This measure, enacted under the interstate-commerce clause of the Constitution, prohibited the shipment in interstate commerce, within 30 days after production, of any goods produced by children under ages specified for certain industries. Its constitutionality was attacked almost immediately in North Carolina and, on appeal to the Supreme Court of the United States, the law was declared invalid in June, 1918, on the ground that it interfered with the powers reserved to the States under the Tenth Amendment. Another act was immediately passed by Congress, becoming a law in February, 1919. In an attempt to circumvent the objection of the Supreme Court, the basis of the act was shifted from the interstate-commerce clause to the taxing power of the Congress by the placing of a 10 per cent tax on the net profits of all commodities produced as a result of the labor of children. This, too, was at once questioned in the courts of North Carolina; in 1922 the law was declared unconstitutional by the Supreme Court. By a unanimous decision, the Court found that Congress was using its tax power illegally, i.e., to punish instead of for the raising of revenue.

The friends of Federal action refused to be deterred. Late in 1923 there was introduced in Congress the Federal Child Labor Amendment, which ran as follows: "*Section 1.* The Congress shall have power to limit, regulate, and prohibit the labor of persons under 18 years of age. *Section 2.* The power of the several States is unimpaired by this article except that the operation of State laws shall be suspended to the extent necessary to give effect to legislation enacted by Congress." On Apr. 26, 1924, by a vote of 297 to 69, the House adopted the amendment; on June 2, the Senate did likewise by a vote of 67 to 23. The amendment thus went to the States for ratification. It met with a speedy fate. By Jan. 27, 1925, it was seen that the amendment had been lost through the rejection of it by 13 State legislatures. Before 1925 was over, the following States had refused their ratification: Connecticut, Delaware, Florida, Georgia, Indiana, Kansas, Louisiana, Maryland, Massachusetts, Maine, Minnesota, Missouri, New Hampshire, North Dakota, North Carolina,

Ohio, Oklahoma, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, West Virginia. By the end of 1928, only five states had ratified: Arizona, Arkansas, California, Montana, Wisconsin.

The following reasons were generally cited for the defeat of the amendment: It was an unwarranted interference with the rights of the States. It marked a recoil against the tendency to seek Federal action in the solution of social and economic problems. It was felt that the general hostility toward the passage of the Eighteenth Amendment (Prohibition) was making itself felt in opposition to all Federal amendments. The farming groups had opposed the ratification of the act because of their feeling that the amendment would be used to prevent the employment of their own children on family-owned farms. The American Federation of Labor directly charged that the farmers had defeated the amendment. While the friends of the amendment indicated their belief that this method of solving the problem was not closed to them and that the agitation for ratification would continue, there was a marked lessening of the propaganda. At its 1926 convention, the American Federation of Labor still breathed its defiance of the employers of child labor; at subsequent conventions, its voice was raised in other causes. Even the National Child Labor Committee, in its 1928 annual meeting, had nothing to say about the continuance of pressure for the passage of the Child Labor Amendment.

**State Action.** The status of children in industry was safeguarded by the States and many of them had elaborate codes on their statute books. Unfortunately, the enforcement of these laws presented difficult problems and too often inadequate provision was made for the creation of administrative machinery. For example, in most States, there were no special child-labor inspectors and the regular factory inspectors were expected also to perform these functions. With respect to the age limit, Utah and Wyoming did not fix a minimum age; 41 States forbade certain types of work for children under 14; 5 States forbade work for children under 15; Montana and Ohio fixed the minimum age at 16. Twenty-three States, however, allowed children under 14 to work outside of school hours and, in the following States, children under 14 were permitted to work in factories: California, Colorado, Idaho, Nevada, New Mexico, and Virginia. In 17 States, children were barred from working in only a limited group of occupations. Therefore, in only 9 States were children under 14 absolutely forbidden to work. Tenement home work was regulated in 14 States; 25 States had no laws affecting street trades. With regard to the issuance of employment permits, only 13 States required such.

The following were the provisions made with regard to the employment of children in hazardous industries: in 30 States, 16 years was the age limit for work in mines and quarries; in 33 States, 14-year-old children might work on railroads and, in 28 States, they might work around explosives; in 35 States, it was lawful for children to work on scaffolding; in 22 States, they might run elevators, and in 17, they were allowed to wipe, oil, and clean machinery in motion. Montana was the only State which did not permit children to work on or near machinery.

The following provisions were in effect with

regard to the schooling of working children: in 15 States, a child had to finish 8 grades (unless over 14 years of age); in 5 States, a child had to finish 8 grades (unless 16 years old); in 10 States, a child had to finish the sixth or seventh grade; in 5 States, the fifth grade; in 2 States, the fourth grade; in 6 States some simple educational requirement had to be filled; in 7 States no educational requirement was necessary. In most States, no permits were necessary if the child was over 16 years. In 28 States, the child had to stay in school until 16, if not working; in 14 States, the child had to stay in school until 17 or 18, if not working. In 24 States, health certificates were required for working children under 18 years. The following were the requirements with regard to hours of work: Montana forbade all factory labor by children under 16; 37 States had an 8-hour day and a 48-hour week (3 of these had the 44-hour week); 5 States had a 10-hour day and the 54-hour week; Georgia and North Carolina each had a 60-hour week.

Almost all States forbade night work for children under 16; 13 States fixed the hours of night work as between 7 P.M. and 6 A.M.; 24 States provided for longer rest periods; Nevada and Utah made no provision at all. The States sought to protect minors, illegally employed, who had suffered injuries in the following ways: in 14 States, children illegally employed fell outside the workmen's-compensation law and the only recourse was a civil suit; in 19 States, such minors that were injured might ask for compensation under the workmen's law; in Wisconsin, the employer alone had to pay triple compensation; in Maryland, Michigan, New Jersey, and New York, the employer had to pay double compensation; in Illinois and Missouri, the employer had to pay an additional 50 per cent. Continuation-school laws were on the statute books of 27 States: in 14, employed children under 16 had to attend these schools for from 4 to 8 hours weekly; in 13 States, employed children under 18 had to go to continuation school.

**Standards.** The minimum standards of the National Child Labor Committee were as follows: 1. No child under 14 shall be employed in any gainful occupation. 2. No child under 16 shall be employed: *a.* At any work or in any place dangerous to life, health or morals. *b.* After 7 at night or before 6 in the morning. *c.* For more than 8 hours a day or 48 hours a week. *d.* During the hours when the public school is in session, unless the child has completed the eight grade. *e.* Without a work permit. 3. No child under 18 shall be employed at any work or in any place dangerous for children under 18, e.g., oiling, wiping, or cleaning machinery in motion; switch tending; working in connection with electric wires, explosives, elevators, hoisting machines; night messenger work.

The National Association of Manufacturers, late in 1927, announced the following plan for the greater protection of working children of the ages of 14 and 15. 1. An employment certificate issued under State authority for each job applied for. 2. A physical examination by physicians designated by the State. 3. Completion of the sixth grade with proper provision for vacation permits. 4. A minimum of four hours a week of continued education either in continuation schools or under shop plans approved by properly constituted State authority,

which should have the power to release individuals incapable of further education. 5. For children under 16, in manufacturing, mining, transportation, or commercial occupations, a 48-hour week. No night work after 9 at night or before 7 in the morning. 6. The strengthening of laws forbidding the employment of children in hazardous occupations. This plan was subject to considerable attack on the following grounds: 37 States and the District of Columbia already had 8-hour laws; 37 States and the District of Columbia already forbade night work after 5, 6, or 7 P. M.; it was a minimum programme in that a large number of States had already accepted or gone beyond the standards set up by the manufacturers, e.g., only 6 States did not require employment certificates, 17 States did not require physical examinations, 19 States did not require the completion of the sixth grade, 21 States had no continuation-school law, 32 States permitted work before 7 A. M., 5 States permitted work after 9 P. M. in manufacturing industries and 15, in mercantile establishments.

The following is the programme adopted in 1928 by the International Federation of Trade Unions, the Labor and Socialist International, and the Socialist Youth International: 1. The minimum age for work shall be through 14 years. 2. Attendance at an elementary school shall be compulsory until admission to the wage-earning class. 3. The introduction of compulsory vocational instruction until the eighteenth year. 4. The extension, up to the completion of the eighteenth year, of protective legislation applicable to apprentices and young workers. 5. The 48-hour week. 6. A free Saturday half-holiday and a free Sunday. 7. No night work. 8. A minimum of three weeks' paid holiday for wage-earning young persons under 16, a two weeks' paid holiday for wage-earning young persons between 16 and 18. 9. Regulations providing for the welfare, unemployment relief, and training of unemployed young workers.

**International Action.** By the draft convention adopted at the Washington Conference of 1919, 14 years was set as the entering age for children working in manufacturing plants, mines, and transportation. By the conventions of 1920 and 1921, the occupations of seafaring, commerce, and agriculture were included. The convention of 1919 was ratified by the following countries: Belgium, Bulgaria, Chile, Czechoslovakia, Denmark, Estonia, Finland, Great Britain, Greece, Irish Free State, Italy, Japan, Latvia, Netherlands, Poland, Rumania, Jugoslavia, and Switzerland. China and India passed similar laws. The 1920 convention affecting seafaring activities was ratified by 19 countries. The 1921 convention, concerning itself with the employ of children in agriculture, was ratified by 11 countries. The 1919 and 1921 conventions also forbade the employment of children (under 18 years) in industry and agriculture between 10 at night and 5 in the morning. These were adopted by 20 countries, as follows: Austria, Belgium, Bulgaria, Chile, Denmark, Estonia, Finland, France, Great Britain, Greece, Hungary, India, Irish Free State, Italy, Latvia, Netherlands, Poland, Rumania, Jugo-Slavia, and Switzerland.

**CHILD WELFARE.** Since 1915 the interest in the problems of child welfare has constantly increased and there has been great activity among public, as well as private, agencies in the United States. In 1912 there was a special bureau for

the health of children in only one State; by 1928 such bureaus were to be found in all the States. The practice of physical and dental examinations in the public schools was rapidly spreading. Special agencies to provide for dependent, neglected, and delinquent children had been one of the great developments of the period under examination (see JUVENILE COURTS). As a result of mothers'-pension legislation, 44 States had made it possible for dependent children to stay in their own homes. During the period 1915-28, States were putting on their statute books laws providing for the care and education of the physically handicapped, the tubercular, the blind and deaf, and the mentally defective. The same period saw the great development of the idea of foster-home care for dependent children, with the result that institutional orphan asylums were regarded askance by those familiar with the latest methods in child care. It is true that a good deal of the enthusiasm that marked the consideration of those problems was not subject to scientific scrutiny largely because of the absence of reliable data. There were no data that made it possible, e.g., to compare the effects of foster-home care with that in an institution.

Again, how many of the programmes for the checking of delinquency, the boys' clubs, the Big Brothers, etc., had in mind a definite idea of the nature of the problem and whether or not the methods then in use were meeting with any success? Frank critics pointed out that these elaborate projects were attracting the good boys (who would remain good, anyway) and had no effect on the bad boys. At any rate, the period showed that it was necessary to get at fundamentals. Nursery schools, where two-year-old children were assembled in groups, provided for expert supervision of play, feeding, sleeping, habit formation, etc., so that, through the examination of control groups, it might be possible to answer some of the perplexing problems that were arising.

In the field of public health, the advances were apparent. During the year 1927, the infant mortality rate was the lowest on record. For the 683 cities in the birth-registration area, the rate was 64.9 per 1000 live births, as compared with the 1926 rate of 73.7. Seattle had the lowest rate among the large cities, with 41 deaths per 1000 live births; New Orleans had the highest rate, with 88. There can be no question that this gratifying improvement was due to energetic public-health programmes, especially those that grew out of the work of the Shepherd-Towner Act. See MATERNITY PROTECTION.

The Children's Bureau of the Department of Labor, which was founded in 1912 and was the first national organization of its kind in any country, has been a clue in this field. Its work began with an inquiry into the subject of infant mortality and published reports on its findings and popular bulletins on proper infant and maternal care. Subsequently, it carried on research and published much material on such subjects as child labor, juvenile delinquency, and juvenile courts, illegitimacy as a problem in child welfare, and the mothers'-pension laws. It also investigated the methods of child care in New Zealand, which had the lowest infant mortality rate of any country. The Bureau was given the administration of the first Child-Labor Act, which was in effect nine months before it was declared unconstitutional,

and of the Maternity and Infancy Act. See MATERNITY PROTECTION; CHILD LABOR; MOTHERS' PENSIONS; EDUCATION IN THE UNITED STATES.

**CHILDREN'S BUREAU.** See CHILD LABOR; CHILD WELFARE.

**CHILE**, chē'lā. A South American republic extending along the western or Pacific coast from Peru to the southern extremity of the continent. Its area is 290,084 square miles and its population, by the census of Jan. 1, 1920, 3,754,723. This was a gain of 505,444 over the last official census, that of 1907, or an annual increase of 1.2 per cent. The populations of the principal towns in 1927 were Santiago, the capital, 587,875; Valparaíso, 191,750; Concepción, 64,074; Iquique, 36,200; Talcahuano, 35,152; Chillán, 31,187; Antofagasta, 60,331. The movement of population continued toward the cities in 1920; 46.6 per cent was urban, as compared with 38.6 per cent in 1895 and 43.3 per cent in 1907.

**Agriculture.** In 1924-25 there were in Chile 5,095,000 acres of arable land, or 2.7 per cent of the total area, 32,744,000 acres of permanent meadows and pasture; 239,000 acres of trees, shrubs, and bushes; and 12,216,000 acres of woods and forests. The following table shows the advance made in agriculture from the pre-war to the post-war period.

Crop	Area (thousands of acres)		Production (thousands of units—bushels except as indicated)	
	1909-10	1926-27	1909-10	1926-27
	to 1913-14		to 1913-14	
Wheat	1,055	1,432	21,243	23,286
Barley	116	190	4,309	5,202
Oats	81	139	3,503	4,139
Corn	59	58	1,538	1,577
Potatoes	73	69	9,048	11,230
Beans	....	95	....	2,226
Peas	....	23	....	377
Grapevines	150	175	56,735 *	54,432 *

\* Unit, gallon of wine.

In 1927-28 there were 33,524,000 bushels of wheat, 7,032,000 of barley, and 7,172,000 of oats produced. The possibility of reaching the American market during the winter for fruits and vegetables has led to a growing interest in horticulture and gardening. The trend toward intensive agriculture manifested itself in the increase in dairy farming, though production by 1928 did not yet suffice for local wants. In 1926 livestock included 323,581 horses, 27,364 asses, 40,187 mules, 1,918,433 cattle, 4,093,872 sheep, 357,033 goats, and 246,636 pigs. These showed little change from the figures of 1912. The wool clip in 1919 amounted to 16,937 metric tons, and in 1927 it was 10,000 metric tons.

**Mining.** In spite of the importance of agriculture, mining is the greatest source of the

silver, cobalt, manganese, coal, salt, borax, sulphur, and other minerals. Nitrate of soda with its by-product, iodine, remains the most important single mineral product and the chief article of commerce; its production steadily absorbed large blocks of capital. The following table indicates the production and export of nitrate for certain years.

Year	Production in Metric Tons	Export in Metric Tons
1910	2,465,415	2,335,941
1915	1,755,291	2,023,294
1918	2,859,303	2,919,177
1919	1,703,240	803,961
1921	1,311,036	1,193,062
1923	1,903,527	2,257,158
1926	2,016,429	1,452,635
1927	1,615,111	2,375,441

A break in the nitrate market followed in 1921 and 1922 as a result of the fall of the farmers' purchasing power the world over. The manipulations of a European buyers' pool and a producing association were features of this trade. More than 3,000,000 tons accumulated with no buyers. The ensuing depression affected the whole country because of Chile's dependence on its nitrate trade. Chilean pesos dropped from 3 to 11 to the dollar; more than four-fifths of the nitrate plants closed, and hard times were universal, so that the Government was compelled to resort to unemployment doles. The market did not recover until the producers yielded to necessity in 1922-23, and cut prices materially. This was due largely to the development of synthetic fertilizer manufactures. The year ending June 30, 1923, saw the sale of 2,000,000 tons of nitrate, and the year 1927 saw the exportation of 2,375,441 tons. In the calendar year 1927, total mineral products exported were valued at \$164,711,000, an increase of \$40,000,000 over the 1911 figures.

**Manufacturing.** In 1926 Chile had 3075 manufacturing establishments using raw materials to the value of 813,771,000 paper pesos (1925); 78,499 workmen were employed. Goods valued at 1,471,584,000 paper pesos were produced. Leading manufactured products are food supplies, gas and electric power, textiles, leather, furs, clothing, chemicals, paper, metal goods, alcohol, lumber, and tobacco. In 1920-21 German capital became active once more and German shipping became important, woolen mills, flour mills, and railway shops and other industrial establishments increasing in the southern districts around Concepción, Penco, and Valdivia.

**Commerce.** Up to 1920, Chilean commerce showed steady advancement except in 1915 and 1916, but the depression that set in with 1920 brought the trade record for 1922 below the pre-

Country	Imports		Exports	
	1913	1927	1913	1927
United States	\$20,049,159	\$38,340,000	\$30,413,385	\$64,381,000
Belgium	5,671,428	9,082,000	5,674,659	3,898,000
Germany	29,578,138	16,286,000	30,772,742	22,365,000
Great Britain	36,109,210	23,836,000	55,548,341	72,862,000
France	6,623,260	6,658,000	8,847,885	6,755,000
Others	22,202,808	26,308,000	11,144,575	33,682,000
Total	\$120,274,001	\$120,510,000	\$142,801,577	\$203,943,000

country's economic wealth. The copper industry increased in recent years, Chile advancing to the place of the world's second largest producer. Iron ore deposits, placed at 1,000,000,000 tons, are found in the departments of Atacama and Coquimbo. Besides, there are mines for gold,

war level. Imports for 1913, 1920, 1922, and 1927 were worth \$120,274,001, \$166,103,810, \$86,571,275, and \$120,510,000; exports for the same years were \$142,801,577, \$284,293,108, \$121,037,500, and \$203,943,000. The accompanying table indicates the distribution of the

trade by countries for 1913 and 1927. In 1928 imports amounted to 1,169,700,000 pesos (1 peso = \$.1217) and exports to 1,965,900,000 pesos, an increase over 1927 of 9 per cent in imports and 16.4 per cent in exports.

The United States steadily forged to the front in Chilean trade during the World War and was able to maintain its leading position afterward. In 1918 Chilean exports to the United States equalled the combined values of all other countries, while imports from the United States into Chile accounted for 46.6 per cent of the total. In 1927 American imports into Chile were 29.7 per cent of the total, as compared with 16 per cent in 1913. Exports to the United States were 31.6 per cent in 1927 and 21.3 per cent in 1913. Thus, Great Britain was completely supplanted. The maintenance of cordial commercial relations between Chile and the United States was due to the expansion of shipping facilities, the local establishment of American banks and credit information companies, investments in Chilean mines and industries, and the completion of direct cable service. Shipping in 1922 was far below the pre-war level, but improved materially by 1928. Foreign vessels and tonnage entering Chilean ports in 1911 were 14,998 vessels, of 26,164,068 tons, and in 1926, 3666 vessels, of 11,612,000 tons. By the law of 1922, coastwise trade was confined to ships of Chilean registry. In 1912 six American ships of 9000 tons entered Chilean ports; by 1926 the figure was 501 ships of 1,773,000 tons.

**Communications.** In 1926 there were 5356 miles of railway, 3398 of them State owned, as compared with 2740 in 1911, with 1418 State owned. In 1921 work was begun on electrification of the line between Santiago and Valparaiso and that between Llay-Llay and Los Andes, 233 miles in all; this was completed in 1924. Though agitation was carried on for construction of the Chilean section of the Antofagasta (Chile)-Salta (Argentina) railroad, no headway was made; this was due to a feeling prevalent in Chile that Argentina would receive most of the benefit from the line. The projected railway is 350 miles, 200 miles of which lie in Chile.

**Finance.** The budget for 1929 provided for the collection of 1,123,201,500 pesos in revenue. The 1912 figures were 101,050,000 gold pesos and 189,200,000 paper pesos. Expenditures in the 1928 budget totaled 1,071,603,975 pesos; in 1912 expenditures according to the budget were 81,070,966 gold and 280,894,118 paper pesos. The public debt on Dec. 31, 1922, was \$240,673,000. The paper peso in 1914 was worth, on an average, 5.50 to the dollar, and in 1918, 3.47; but in 1921 the industrial depression lowered it to 8.29; in 1922 it was 8.41; and the average for 1923 was 8.22, notwithstanding improved economic conditions. By 1927 it was fairly well stabilized at about \$0.1207, or a little over 8 to the dollar.

**Education.** Primary education was made compulsory in 1920, but the figures for 1928 show no great change from 1911. In the later year, primary schools numbered 3123 (2896 in 1911); enrolled pupils, 459,777 in July, 1928 (375,274 in 1911); and teachers, 9414 in 1926 (4829 in 1911). In 1926, 60,620 pupils were in secondary schools (20,329 in 1911). Two new universities were opened in 1920, the Industrial University at Valparaiso and the University of Concepcion. Agricultural and vocational education are receiving increased attention.

**History.** The known sympathies of a considerable element of the Chilean population for Germany in the World War, through family, intellectual, and commercial ties, did not interfere with the neutrality which it maintained throughout. The falling off of trade immediately following the outbreak of the War caused serious unrest, but affairs improved when Chile began to play a prominent part in furnishing the Allies with war materials. In 1918 this intercourse reached its peak, with widespread prosperity. In 1919 exports fell to half their former volume but were completely restored in 1920. Not until the world-wide depression of the next year did trade once more languish, to the accompaniment of labor troubles and disorders.

The end of the administration of Juan Luis Sanfuentes (1915-20), Conservative coalition leader, brought on an election campaign which revealed how widely liberal tendencies had spread. The campaign was fought between Arturo Alessandri, candidate of the Liberal Alliance, a bloc of middle-class and working-men's parties, and Luis Barros-Borgoño, the representative of the governing bureaucracy. The returns gave Alessandri 179 electoral votes to Barros-Borgoño's 175, but, because of several contests and the tense political feeling, Alessandri's victory was not assured until a special Court of Honor found for him a vote of 177 to 176 (Oct. 4, 1920). The new president was committed to a reform programme that included administrative decentralization, qualified woman suffrage, separation of church and state, an income tax, a labor code, and state control of the nitrate industry. He found it, however, almost impossible to make progress with these reforms, which met with such opposition from the conservative elements in Congress that even the necessary routine functions of government could hardly be carried on. To quiet the political turmoil, the President, on Jan. 7, 1924, dissolved Congress; but a compromise was effected and on February 9 the Senate, in return for acceptance by Alessandri of a limitation on his power to suspend Congress, passed a number of measures, including an income-tax law, which he particularly desired. The Congressional elections of March, 1924, upheld his liberal policies and, when Congress met on June 1, the Government had a majority in both Houses; but the hopes for harmony which such a state of affairs aroused were soon dissipated. Congress seemed to have become merely a battlefield for political factions. Little or no legislation of value could be passed, government finances were demoralized, salaries of government officials were left unpaid, and no revenue was in sight to meet the heavy and growing deficit. Failure of a bill increasing military pay brought matters to a head. On September 4, a group of army officers presented an ultimatum demanding the immediate passage of certain measures. Although the President and Congress promptly complied and the existing ministry resigned, and although a little later the military group issued a statement saying that no military or other dictatorship was intended, it was recognized that the powers of government had definitely passed into new hands and a bloodless revolution had been brought about. President Alessandri left the country on a six months' "leave of absence." A *Junta de Gobierno*, or committee of government, headed by General Luis Altamirano, appointed a cabinet containing both military and civilian ele-

ments (September 12), and announced a general election of President and Congress for the following May 10, 1925.

With Congress dissolved, the new government, through a series of decree laws, entered on a vigorous programme of reform measures affecting the whole life of the country; but its progress was halted abruptly when a new *coup d'état*, Jan. 23, 1925, placed a second military group in control. The two factions came near to civil war but were brought together under a plan by which military, naval, and civilian elements were represented on a new *Junta*.

Immediately after the *coup*, President Alessandri had been invited to return and resume the Presidency. He replied from Venice, Italy, consenting to do so provided the military should return to their proper duties, a constituent assembly should be called to revise the constitution, new election laws should be passed, and a non-partisan civil government should be established. These conditions having been agreed to, he returned on March 20 and was enthusiastically received. He at once set about the task of placing the government on a constitutional basis by appointing a committee to propose changes in the existing constitution. Labor troubles marked this unsettled period. A general strike in Valparaíso in February for a while paralyzed business, and later outbreaks of workers in the nitrate regions brought the military into action and resulted in the banishment of a number of radicals to the island of Juan Fernandez.

A more auspicious development in 1925 was the adoption of plans for stabilizing Chilean finance. A financial mission headed by the American, Prof. E. W. Kemmerer, made an exhaustive study of the country's finance and advanced a number of recommendations. As a result, a central bank was created (August 21) and a law was signed (September 16) establishing as the country's monetary unit the gold peso of 0.183057 grams fine, valued at about 12 cents, United States currency, or at the rate of 40 to the pound sterling. After many years of instability, Chilean currency was thus at last put on a gold basis.

In July, the constitutional committee made its report. It recommended a revised constitution whose central feature would be a concentration of power in the hands of the President. Ministers were made responsible to the President only. The President's term was made six years instead of five, and he was to be elected by direct popular vote. Other provisions separated church and state, centralized financial control, etc. In August, a plebiscite overwhelmingly approved the new constitution. Before the election of a new President could be held (as provided for in the constitution), political feeling ran very high over candidacies, and, as one result, President Alessandri resigned. The leading factions at length agreed upon former President Figueroa and he was elected (October 24) by a large majority. This result, however, failed to bring the public peace of mind so much desired. Strike riots in Santiago followed the election and were symptomatic of a restlessness of labor which was always threatening to break out in disorders.

During the following year, this feeling was reflected politically in tense parliamentary situations, the radical and labor elements being opposed by the military. Leading the army group

was the Minister of War, Col. Carlos Ibáñez, a forceful figure destined to dominate the politics of Chile for years. Early in 1927, Colonel Ibáñez took a series of steps which, by mid-year, had placed him in the Presidency with the powers of a dictator. In February, he became Premier and Minister of the Interior, and in April, Vice President, with practically full control. President Figueroa resigned and, in May, elections were held to choose his successor. Colonel Ibáñez was elected by a great majority. As his power grew, he waged vigorous war on all communistic and disloyal influences as well as corruptionists, his professed aim being the promotion of an intense, even an austere, nationalism. His measures were often drastic. Early in 1927, he banished a large number of communists to the island of Mas-a-Fuera and in 1928 also deported to the same uninviting place bands of "red" agitators. Other political opposition was crushed by the summary exile of various leaders, most prominent of whom was former President Alessandri. Measures were taken to weed out of the schools and the government service all persons suspected of being in sympathy with radicalism. As a result of these measures, a new national spirit was evoked which greatly stimulated many lines of activity. Trade and industry revived, the financial situation improved, unemployment decreased.

In the field of international relations, the post-war period was for the most part uneventful except for one all-important development, the attempt over several years to settle the Tacna-Arica question. In 1919, at the request of the Council of the League of Nations, Chile joined the League, and had the pleasure of seeing Augustin Edwards, Chilean Minister to London, elected president of the third League Assembly in 1922. In the spring of 1923, the Fifth Pan-American Conference was held at Santiago. The chief controversial issue, disarmament as between the A. B. C. powers of South America, was left unsettled and the failure to reach an agreement caused much disquietude in Chile, as the country was spending an average of 22 per cent of its budget on defense. On Feb. 24, 1927, Chile and Italy signed a treaty in which a method was outlined for settling any future disputes that might arise.

Chile's international concerns, however, centred almost wholly on the Tacna-Arica problem, a rankling source of trouble since the Treaty of Ancon in 1884. That treaty provided for a plebiscite to determine the ownership of the two obscure provinces, Tacna and Arica, which have no economic importance with their area of only 26,036 square miles and population of 39,000. Negotiations in 1920 and 1921 ended in an impasse. In July, 1922, both governments agreed to accept the President of the United States as arbitrator and agreed further that if a plebiscite was determined upon, the President was to fix the conditions under which it would be held. President Coolidge announced his decision in March, 1925. It called for a plebiscite, with payment of 10,000,000 pesos to the losing country as provided in the Treaty of Ancon. A plebiscite commission of three, made up of one representative of Chile, one of Peru, and one member, the chairman, to be appointed by the President of the United States, was to supervise the preparations for, and the holding of, the plebiscite. The award also decided that the province of Tar-

apa rightly belonged to Peru, and Chile acquiesced. Gen. John J. Pershing, U. S. A., was selected as the American member of the commission, which organized at Arica on August 4. Friction presently developed, particularly over the date of the plebiscite, which Chile insisted should be held without delay, and, later, over alleged misuse of her administrative powers by Chile to prevent a fair vote. Chile's delegates remained away from many meetings of the commission. On December 9, the commission announced February 15 to March 15 as the registration period and April 15 as the date of the plebiscite. General Pershing resigned and was succeeded on January 13 by Gen. William Lassiter, U. S. A. Although registration of voters began, the plebiscite date was postponed and it became evident that the whole plan had fallen through. In November, 1925, Secretary Kellogg, of the United States Department of State, made a further effort to effect a settlement by submitting a concrete proposal, assigning the two provinces to Bolivia, but it proved unacceptable. President Ibáñez favored direct negotiations between Peru and Chile and they were carried on into 1929. Just when they seemed to have reached an impasse, it was announced at Washington (May 16, 1929) that through the good offices of President Hoover a settlement of the long-drawn-out controversy had been reached. The terms of the settlement gave Tacna to Peru, and Arica to Chile. Chile was to pay to Peru \$6,000,000 and was to grant to Peru a wharf, customhouse, and railway station at Arica. Bolivia and her desire for an outlet to the sea were not mentioned in the settlement. See TACNA ARICA CONTROVERSY. In July, 1929, Chile ratified the Kellogg Peace Pact.

**CHINA.** China proper consists of the 18 provinces, about 2,000,000 square miles in area, Chihli, Shansi, Shantung, Kansu, Shensi, Honan, Anhwei, Kiangsu, Chekiang, Kiangsi, Hupeh, Szechwan, Kweichow, Hunan, Fukien, Kwantung, Kwangsi, and Yunnan; and the dependencies of Manchuria, Mongolia, Sinkiang (Chinese Turkestan), and Tibet—a total area of 4,282,000 square miles. The exact population is un-

known; estimates vary from 325,000,000 to 445,000,000. China, therefore, has a density of population of from 80 to 100 per square mile and about 175 for China proper; Shantung had 528 to the square mile; and Kansu, 40. Six-sevenths of China's population, however, live on one-third of its area and are concentrated generally along the coasts and in the huge delta plains of the three great rivers, the Yellow in the north, the Yangtze in the centre, and the West River in the south.

**Agriculture.** No reliable statistics of production in China are available. The only reliable clue to production is the surplus exported and regularly recorded by the Maritime Customs, under foreign control. The following estimate of China's production of chief crops is based on observation by reliable authorities: silk, 100,000,000 pounds; rice, 600,000,000 bushels; wheat, 200,000,000 bushels; soya beans, 150,000,000 bushels, 70 per cent Manchurian; Han cotton, 2,200,000 bales; Kaohang corn, 200,000,000 bushels; maize, 100,000,000 bushels; millet, 100,000,000 bushels; peanuts, 200,000 tons. Soya beans and raw cotton showed remarkable increases following 1913. Other crops remained the same.

The following tables give a comparison between the exports and imports of China for the years 1913 and 1926. It will be noted that despite the years of the World War and the almost continual struggle for supremacy in the civil war in China, with its political agitation, military operations, commandeering of transportation facilities, labor disputes, boycotts, and currency depreciation, the dollar value of imports and exports has more than doubled.

The combined value of China's export and import merchandise trade in 1927 was \$1,332,770,000, representing exports of \$656,864,000 and imports of \$675,906,000. During 1927 the United States supplied 16.2 per cent of China's imports and bought in return 13 per cent of her exports: Japan's shares were 28 and 30 per cent, respectively; Great Britain's (exclusive of Hongkong), 7.3 and 6.3 per cent; Germany's, 3.8 and 2.2 per cent.

## IMPORTS FOR CONSUMPTION BY PRINCIPAL COMMODITIES

**Shipping.** During 1926, 153,996 vessels of 134,659,606 tons entered and cleared Chinese ports. Of these, 5338 of 6,496,351 tons were American; 36,474 of 47,645,090 tons, British; 2262 of 2,321,632 tons, French; 813 of 2,905,127 tons, German; 1045 of 731,499 tons, Italian; 29,654 of 38,948,844 tons, Japanese; 2407 of 3,301,874 tons, Norwegian; 1444 of 447,094 tons, Portuguese. In 1913 the total tonnage which entered and cleared was 93,334,830; in 1921, 114,619,544.

**Railroads.** China had in 1927 only 8750 miles of railroads to cover an area of 4,500,000 square miles. There was practically no new construction after 1913. The 23 different railroad lines form two north-and-south trunk lines, one from Changsha, below the Yangtze, to Peking and one extending from Shanghai to Tientsin and on up to Harbin. There is one east-and-west trunk line, which, when completed, will extend from Lanchow, in Kansu, to Haichow, on the seacoast of Shantung. There are various connecting and disconnected short lines.

**National Debt.** On Oct. 21, 1921, China's national debt was reliably estimated at \$1,814,002,511.88 silver (\$1 silver = about \$.50 gold). In addition, there was at least \$86,000,000 (silver) contracted in concealed debt, treasury notes, and unpaid salaries of officials, or a total of \$1,900,002,511.88. The detail of this debt, which was about \$5 (silver) per capita is as follows: Secured on Maritime Customs and Salt Revenue; general foreign loans, \$267,979,252.34; foreign railway loans, \$334,802,631; foreign indemnities, \$482,841,744; internal long-term loans, \$275,226,738; internal short-term loans, \$69,101,978.54; treasury notes, \$18,640,000; total secured, \$1,449,592,343.88; unsecured: foreign obligations, \$217,047,073; native obligations, \$41,412,078; concealed debt, \$65,000,000; advances on salt, \$40,951,017; additional concealed debt, \$40,000,000; treasury notes, \$14,000,000; salt bonds, \$10,000,000; Dragon Boat Festival notes, \$2,000,000; unpaid

salaries, \$20,000,000; total unsecured, \$450,410,168. An American estimate placed the public debt on Dec. 31, 1925, at \$1,250,000,000. All foreign loans and indemnity obligations secured on the customs revenue were met in full during 1927 and 1928. See below, under *History*, for the establishment of the Nationalist government in 1928 and for the relations of China to the Washington Arms Conference.

**History.** At the beginning of 1914, Yuan Shih-kai was carefully proceeding in the execution of his plans for the reconstruction of the old autocratic government and of the centralization of power. Step by step he emasculated the innovations of Western democracy and parliamentarianism. Outside of the circles of Young China, these measures produced little reaction, for the mass of people were not greatly interested in the Western innovations which ran counter to their instincts and customs, and, after all, they were tired of being looted in the name of liberty. It was only when the President decided to perform henceforth the Winter Solstice sacrifice at the Temple of Heaven that the people began to take notice, because by performing this ceremony, the symbol of the old emperor's function in the state, he practically proclaimed himself an autocratic ruler. This policy of Yuan Shih-kai was strikingly demonstrated by the presidential mandates, especially the Presidential Election Law of December, 1914, whereby the President's term of office was lengthened to 10 years. Deftly Yuan Shih-kai's astute statesmanship restored the authority of the central government, at the head of which he ruled as undisputed dictator.

If the restoration of the monarchy and the realization of Yuan Shih-kai's designs on the throne had been merely matters of internal politics, they would probably have succeeded; but questions of foreign policy intervened to frustrate Yuan's schemes. After the capture of Kiaochow, the Japanese government presented, on Jan. 18, 1915, a protocol embodying the notori-

ous Twenty-one Demands, the fulfillment of which would have meant the most serious infringement of Chinese sovereignty that had occurred thus far. (See JAPAN and SHANTUNG.) After four months of negotiations, in which Yuan Shih-kai took the stand that acceptance of the demands would tend to impair China's sovereignty and the treaty rights of other Powers, the Chinese Foreign Office was compelled, by a 48-hour ultimatum, to accept most of the Japanese demands, in slightly modified form. As originally presented, the Twenty-one Demands were grouped in five sections. The first section required the Chinese government's full assent, in advance, to whatever settlement Japan and Germany might make regarding the disposition of German rights in Shantung, the opening of additional commercial ports in Shantung, and the construction of a branch from the Shantung railway to Chefoo or Lungkow.

These stipulations were accepted with very little alteration and embodied in a treaty and several notes, signed on May 25, 1915. In return, Japan agreed to return the leased territory of Kiaochow Bay to China, after the War, if certain conditions were fulfilled. (See PEACE CONFERENCES and SHANTUNG.) Section II, likewise accepted and embodied in a treaty with several supplementary exchanges of notes, strengthened Japan's grip on southern Manchuria and eastern inner Mongolia, by extending the Japanese lease of Port Arthur, Dalny, the South Manchurian Railway, and the Antung-Mukden Railway to 99 years, by granting Japanese subjects the right of leasing or owning land and engaging in any kind of business, by handing the Kirin-Changchun Railway over to Japanese administration, and by assuring to Japan an option on the development of mines, the financing of railways, and the nomination of foreign advisers in these provinces. Section III proposed to convert the Hanyehping Company, the great Chinese coal, iron, and steel concern located at Hankow on the Yangtze, in the British sphere of influence, into a joint Sino-Japanese enterprise with monopolistic control of future mine development in the neighborhood. To this extraordinary demand, China assented in an exchange of notes, but the clause relative to future mining operations was omitted. Section IV embodied a blanket pledge on the part of China "not to cede or lease to a third power any harbor, bay, or island along the coast of China"; this pledge China refused to incorporate in any treaty or note, as such a declaration would have implied a Japanese protectorate.

Finally, Section V, or "Group Five" as it was more commonly called, contained provisions that would have meant the firm establishment of a Japanese protectorate over China; China was to employ "influential Japanese as advisers in political, financial, and military affairs"; Japan was to have a share in the police administration "of the important places in China"; China was to purchase "say 50 per cent" of her war munitions from Japan, either directly or through a Sino-Japanese arsenal. Furthermore, Japanese were to be allowed to propagate religious doctrines, i.e., Buddhism, in China; Japanese hospitals, churches, and schools were to be given the right of owning land; Japan was to build certain railways in the Yangtze Valley, again infringing on the British sphere of influence; and Japan was to have an option on supplying capital for mines, railways, har-

bors, and dockyards in Fukien Province. To Group Five, the Peking government resolutely refused assent; the most that could be conceded was an exchange of notes stating that China had not given any foreign nation permission to construct military or naval works on the Fukien coast. There had been rumors of an agreement for such construction by the Bethlehem Steel Company.

Although the other items in Group Five were temporarily dropped, the Japanese government merely postponed them "for future discussion"; and they may be regarded as significantly expressive of the imperialist aims of the Japanese government in 1915. The net result of China's partial acquiescence in the Twenty-one Demands of 1915 was to fortify Japan's privileged position in her spheres of influence—south Manchuria, eastern Mongolia, Shantung, and Fukien—and to open the heart of the rich Yangtze valley to Japanese economic penetration. The attitude of the United States Government toward the Japanese manœuvre was set forth in identical notes to China and Japan, May 9, stating that the United States could not recognize any agreements impairing treaty rights, the integrity of China, or the Open Door; and as Secretary Bryan had already issued a statement to the press on May 6, expressing his hope that the agreements might be mutually "satisfactory" and contribute to the "prosperity" and "cordial relationship" of "these great Oriental empires," it was obvious that the United States, while formally supporting Chinese integrity, was not disposed to offer any determined opposition to Japanese aggression.

These events served to make it clear that in any fundamental change in the Chinese government, such as the restoration of the monarchy, Japanese intervention would have to be reckoned with. When, therefore, the State Council referred the question of the monarchy to a vote of the provinces, in October, 1915, the Japanese Minister in Peking, supported by his British and Russian colleagues, "offered friendly advice" on behalf of his government against the restoration of the monarchy. This intervention of the Powers, especially of Japan, sealed the fate of Yuan's aspirations to the throne. Although the provinces registered a unanimous vote in favor of his accession on Nov. 5, 1915, the proclamation of the monarchy on December 12 was followed almost immediately by an insurrection, which rapidly accumulated speed and became general. The Southern leaders set up a provisional government at Canton and hailed as president the former Vice President, Li Yuan-hung. After many and prolonged manœuvres to save his face, Yuan Shih-kai died on June 5, 1916, of a broken heart, as it was said. Li Yuan-hung became President, and Tuan Chih-jui, Premier, of the Chinese Republic.

If Yuan's death was universally regarded as a temporary solution of China's great internal problem, it proved almost at once to be quite the opposite. After his death, conditions in China became rapidly more chaotic. The new Peking government made a show at parliamentary government by convening the Parliament of 1913 for Aug. 1, 1916. Its measures, however, did not tend to produce any coöperation from the Southern or Canton government. The essential difference between the two camps was that Peking was dominated by the military party, a combination of military governors and shrewd

politicians, in which the former used the latter for their purposes, whereas Canton represented the Kuo Min-tang Party and Young China with their exuberant enthusiasm for Western democracy.

During the remainder of 1916 the political and financial situation grew more disorganized. Then came the entry of China into the World War. On Mar. 14, 1917, Allied influence (supported by persuasion from the United States), finally prevailed over German intrigue and the Peking government severed relations with Germany. The Premier and the military party insisted upon waging war actively but were held back by President Li, the Kuo Min-tang, and the Canton chieftains, who favored a declaration of war by parliamentary procedure. President Li dissolved Parliament unconstitutionally, and, on May 23, 1917, dismissed Premier Tuan, who thereupon set up a provisional government in Tientsin supported by the military governors, or Tuchuns. When, on June 6, the United States intimated in a note that internal unity was more important than a declaration of war, Japan, which was generally regarded as controlling Tuan, resented the move. At this juncture, a new force appeared. On June 12, General Chang Hsiin arrived before Peking with an army and, after 18 days of apparently satisfactory meditation, suddenly restored the Manchu Emperor to the throne. But the rule of the young Son of Heaven lasted only 12 days. From Tientsin, Tuan Chi-jui marched on Peking with troops supplied by the Tuchuns and the republican South, ejected Chang Hsiin and the Emperor, and reestablished the Republic. Resuming the premiership, Tuan, on July 18, replaced Li Yuan-hung as President with Vice-President Feng Kuo-chang. A formal declaration of war on Germany followed, on Aug. 14, 1917. It involved the sequestration of German property, the uprooting of German financial and commercial interests in China, and, as a reward from the Allies, a loan of 10,000,000 yen, secured by the salt revenues (gabelle), and a suspension of Boxer indemnity payments.

Submissive to Japan, the new Government enjoyed relatively strong authority. But the Southern faction, opposing the militarism of the Peking government and especially a declaration of war without action by Parliament, revolted in June, 1917, and set up a new government in Canton headed by Dr. Sun Yat-sen who had traveled and studied extensively in the West. Premier Tuan's desire for strong military measures against the rebellious elements was opposed by President Feng and a hopeless tangle ensued, with war between North and South (in which some provinces remained neutral), conflict between the Peking leaders, and independent action by the Northern Tuchuns. Premier Tuan finally had his way and the war against the secessionists was waged, with fluctuating success, during the remainder of 1917 and the first half of 1918. To preserve a semblance of constitutionality, Tuan convened an assembly for a revision of the electoral law. On the promulgation of this law, on Feb. 17, 1918, the new Parliament was elected, which, on September 4, chose Hsi Shih-chang as President to replace Feng Kuo-chang, who had proved unsatisfactory to the Anfu Club. The new President made a sincere effort to end the civil war and on Nov. 16, 1918, ordered the Northern commanders to withdraw from Southern territories. This armistice was

followed in the spring of 1919 by a peace conference at Shanghai, which, however, achieved nothing.

Under Tuan Chi-jui and the Anfu Party, China became powerless in the hands of the Japanese, since the Allies were too preoccupied with the World War to interfere. In March, 1918, the Peking government concluded military and naval agreements with Japan whereby the Japanese, under the pretext of action against a Bolshevik danger, obtained a complete hold on Northern China, including control of the Chinese Eastern Railway and Northern Manchuria. At the Peace Conference, Japan's actions with regard to China during the War received the official indorsement of the Allied Powers when Lloyd George and Clémenceau, in accordance with secret pledges given to Japan in 1917, and President Wilson, in order to save the League of Nations, and relying on the Japanese promise eventually to excavate Shantung, accorded Japan all the former German "rights, title, and privileges in the province of Shantung." (See PEACE CONFERENCES.) The Chinese delegates, supported by Chinese public opinion, pleaded their case with ardor and ability and refused to sign the Versailles Treaty, which contained the article relating to Shantung. The decision of the conference aroused vehement indignation in China, which Young China successfully employed to launch an anti-Japanese movement. The general disappointment and resentment of the Chinese people, who derived some comfort from the fact that the United States refused to ratify the Treaty, were directed primarily against the ruling Anfu Party, the pro-Japanese policy of which was blamed for the national misfortune. Although, in the great excitement, the guilt of that political clique was greatly exaggerated for reasons of internal policy, there was nevertheless much cause for such feeling, since the position of the Chinese delegation at the conference had been seriously injured when it became known that the Tuan government had concluded, in the fall of 1918, a secret agreement whereby Chinese rights with regard to Shantung had been practically surrendered. In the summer of 1920, the anti-Japanese movement, under the influence of the agitation of the students, drove Tuan Chi-jui and the Anfu Club from the government. The Anfu leaders took refuge in the Japanese Legation, and some of them fled subsequently to Japan to escape popular wrath.

Japan worked hard to consolidate her position in China, but after the Peace Conference the Powers were once more able to devote their attention to Far Eastern affairs, and subsequent events brought about a partial modification of the Japanese policy in China. The new Peking governments were less subservient to Japan than the Anfu leaders and strove to recover some of the ground lost during the War. Repeated attempts on the part of Japan in 1920 and 1921 to come to an agreement with China regarding Shantung, by offering to restore the territory provided certain concessions were granted her, failed because of Peking's steadfast refusal to consider anything short of almost unconditional evacuation. At the Washington Conference (see WASHINGTON CONFERENCE) at the end of 1921, the Chinese delegation insisted on bringing the Shantung question before the Conference. The Japanese, on the other hand, wanted to negotiate with the Chinese directly, for this would have confirmed the tacit Japanese contention, contained also in the Lansing-Ishii Agreement,

that China was in fact an informal Japanese protectorate. The Conference decided on a compromise by conceding the Japanese demand but providing for Anglo-American mediation in case of deadlock. When the deadlock actually took place, the English and American mediators, influenced by public opinion at home, brought pressure to bear on the Japanese to give way. The Shantung Treaty which was signed by Japan and China early in 1922 provided for the restoration to China of the former German Leased Territory of Kiaochow and all public properties therein, together with the Tsingtao-Tsinanfu Railway and its branches, the value of the railway properties being reimbursed to Japan by China. The conference reached, in addition, numerous other agreements of primary importance to China. See SHANTUNG and WASHINGTON CONFERENCE.

The lapsing of the Anglo-Japanese Alliance as a result of the conclusion of the Four Power Treaty, it is widely believed, should affect China greatly in the future, inasmuch as in consequence thereof Great Britain will be inclined in the future to coöperate with the United States rather than with Japan in regard to Chinese affairs. The surrender by the Japanese of Kiaochow Bay induced the British to promise to relinquish the Leased Territory of Wei-hai-wei. Provisions were made also for a revision of the customs schedule and for the abolition of the foreign post offices in China. The conclusion of the Nine Power Treaty reaffirming the Open Door and the integrity of China brought with it also the abrogation of the Lansing-Ishii Agreement.

In general, the Washington Conference resulted in a material improvement of the Chinese situation with reference to the Powers. Whether it was due to pressure from the Powers or to a voluntary new orientation of Japanese policy, Japan seemed to modify thereafter her policy of encroachment on Chinese territory and sovereignty. By far the most important result of the Washington Conference with regard to China, however, was the adoption of the open-door policy, which, in substance, amounts to a concerted exploitation of China by the Powers as over against competitive exploitation based on spheres of influence in the past. This development is to be ascribed directly to the efforts of the United States. The Chinese Loan Consortium and its workings were part and parcel of this policy. An agreement had been arrived at, in October, 1920, whereby combined financial supervision over China had been provided through the establishment of the Four Power Consortium to represent banking interests in the United States, Great Britain, France, and Japan. The chief points in the arrangement were the establishment of an international board for the abolition of special spheres of influence, insistence on the disbanding of troops, and the combining of all railway concessions into a large Chinese railway system financed and supervised by the consortium.

After the fall of Tuan Chi-jui and the Anfu Club from power, the Government passed into the hands of the Chihli faction, the ruling politicians of which renewed the old struggle for spoils on a still greater scale. General Wu Pei-fu, who had been an important factor in the defeat of the Anfu Club, and who had come to the fore with a proposal for a national convention, was deftly pushed aside. A few powerful

super-Tuchuns, chief of whom were Tsao Kun and Chang Tso-lin, reduced the authority of the central government to a mere shadow, removing the figurehead officials at will. In the South, the situation was hardly more hopeful. The Canton government had become disrupted and intermittent fighting took place between Sun Yat-sen, his former lieutenant, Chen Chiung-ming, and other factional leaders. In 1922 a struggle for supremacy broke out among the Northern Tuchuns. Wu Pei-fu, lord of the Yangtze, opposed Liang Shih-yi, who was a creature of Chang Tso-lin, lord of Manchuria.

In the fighting that ensued between Chang and Wu, the powerful Manchurian Tuchun was defeated and driven back to his own province. The victory made General Wu a dictator. He forced President Hsü Shih-chang and the cabinet to resign and recalled former President Li Yuan-hung and the twice-dissolved Parliament of 1917. In view of Li's reputation as a defender of parliamentary rule and of General Wu's supposed liberal tendencies, these developments gave rise to hopes for the establishment of orderly and constitutional government.

These hopes were sadly disappointed; neither President Li nor Parliament (nor the Cabinet), which was composed of leaders of Young China, were able to cope with the situation, and it was evident that General Wu's good intentions had been grossly exaggerated. The Tuchun rule remained essentially as before, with the three powerful leaders, Wu Pei-fu, Tsao Kun, and Chang Tso-lin striving for supremacy. Relations between North and South likewise continued hostile, but both General Wu and Dr. Sun Yat-sen were each prevented from advancing against the other's capital by rivalry in their own territories. Slowly, however, two large hostile camps evolved, the Northern group under Wu Pei-fu and Tsao Kun, with Chen Chiung-ming in the South as collaborator, and the Southern group, led by Dr. Sun Yat-sen, who counted on the aid of Marshals Chang Tso-lin and Tuan Chi-jui in the North.

In 1923 Peking again changed masters, when President Li Yuan-hung was forced out by the militarists and fled to Tientsin and then to Shanghai, where, in conjunction with 200 members of Parliament, he attempted unsuccessfully to form a provisional government. He later found an asylum in Japan. The Presidency remained unfilled until October, 1923, when Marshal Tsao Kun (by wholesale bribery, it was claimed), induced enough members of Parliament to return from Shanghai to form a quorum and elect him to the office. He thus emerged as the most powerful factor in the North and, on the whole, used his new authority well. Immediately after his inauguration, he persuaded Parliament to adopt a new constitution providing for far-reaching provincial decentralization. He faithfully supported Wu Pei-fu in his successful campaign against the South which, in the spring of 1924, brought a large portion of southwestern China under Northern control. For a brief space, the country came near being unified, nominally at least, under one central authority. Only Manchuria and the provinces of Chekiang, Kwangtung, and Yunnan refused to acknowledge the authority of Tsao Kun.

The prestige of the central government was so far restored that it was able to conclude important agreements with two foreign governments. In May, Germany and China came to

terms with respect to financial claims and other matters. Against Chinese reparation claims, Germany surrendered large blocks of pre-war railway bonds and bonds of the reorganization loan of 1913, while China released unsold German property sequestered during the war and permitted the reestablishment of the Deutsche-Asiatische Bank. On May 31, after months of negotiation, China signed a series of agreements with Russia providing for recognition of the Soviet government, the right of China to purchase the Chinese Eastern Railway, renunciation by Russia of extraterritorial rights and of Boxer indemnity payments, return to Russia of legation and consular buildings, etc. In June, 1924, the United States Congress passed a law remitting all further payments on the Boxer indemnity obligations.

In September, civil war again raised its head in the North. Chi Hsi-yuan, in control of Kiangsu Province, and Lu Yung-hsiang, Governor of Chekiang, began fighting each other for the possession of Shanghai. Their little war soon drew in the big leaders. Marshal Chang Tso-lin took up the cause of his ally Lu, and Wu Pei-fu made common cause with Chi. Other leaders throughout China showed their sympathy with one side or the other. Dr. Sun Yat-sen taking side with the Manchurian overlord. Chang Tso-lin marched on Peking and Wu Pei-fu came up with large forces to defend the capital; but before they met in a decisive engagement, the issue was decided in a totally unexpected manner. Wu's general in command in Peking was the so-called Christian general, Feng Yu-hsiang, whose rigid discipline and insistence on moral conditions in his army gave him what were reputed to be the best troops in China. On being ordered to attack the Manchurian forces, he suddenly deserted Wu, took over the control of Peking, and formed a new government. Wu held out for a few days but was compelled to retreat and his army disintegrated. Chang Tso-lin and Feng Yu-hsiang, temporarily allies, placed Tuan Chi-jui at the head of the government, but with the title of Chief Executive instead of President. He announced a new constitution and a provisional government and called a reorganization conference to meet in 1925.

When Sun Yat-sen came north and conferred with Marshals Feng, Tuan, and Chang, hope for a central government with authority over the whole country was once more renewed; but the hope again proved illusory. On Feb. 1, 1925, the reorganization conference met, but its eleven weeks of secret sessions accomplished very little. In the midst of it, on March 12, Dr. Sun Yat-sen died. He was the leader of the Kuo Min-tang, and had been the central figure of the whole revolutionary movement and the moving spirit in the overthrow of the Manchu dynasty. In 1911 he had been chosen first President of the Republic but had stepped aside in favor of Yuan Shih-kai, who surpassed him, he thought, in administrative ability. Throughout the year, the political situation continued unstable, although no clashes involving the major leaders occurred until toward the close of the year.

In another field, however, outbreaks and turbulence with a far-reaching effect marked the year 1925. Throughout these troubled years of incessant civil war, two developments in Chinese life calculated to bring increasing conflicts with foreign interests in the country had

been growing more pronounced. One was the spirit of nationalism, more or less closely allied at first with a deep interest in the radical theories of Moscow. It found its chief expression in the activities of the Kuo Min-tang and the Canton government, but it permeated the North as well and influenced the policies of the various Peking governments. The other development was the steady and continued industrialization of China. Factories and mills multiplied, particularly along the coast and the inland transportation arteries, bringing in their train a revolution in the mode of life of millions of Chinese. A large part of these mills were capitalized and operated by foreigners, though they employed Chinese labor.

Without the restraints of factory laws or an informed public opinion, this rise of machine industries repeated many of the worst evils that marked the industrialization of England a century before. Children of five and six years of age often worked 12 hours a day, while wages even for adults hardly sufficed in many cases to support life. These conditions induced a rapid unionization of labor, whose solidarity was strikingly evidenced in such events as the Hong-kong seamen's strike of 1922, which tied up shipping along the coast. Labor restiveness, anti-foreign feeling, and an awakening national consciousness combined, in 1925, to produce a state of public mind which observers felt to be increasingly charged with danger.

On May 30, 1925, the expected outbreak came. A Japanese overseer had killed a Chinese laborer in a Shanghai mill, and when a parade of strikers and students, organized in protest, grew threatening, they were fired upon by Sikh police of the International Settlement on the order of a British police officer. Nine Chinese were killed and twenty wounded. These and further killings in the rioting that followed in the next day or two kindled a flame which swept over the whole country, rousing the Chinese against all foreigners, but particularly against the British and the Japanese. Strikes and boycotts against British and Japanese goods were declared, and demonstrations in Peking and many of the treaty ports caused much further loss of life. On June 2, American, British, and Italian marines were landed at Shanghai from cruisers and gunboats which had rushed to the scene and the International Settlement was made ready for a siege.

For a while, the situation was extremely tense. A general strike tied up business of all kinds, the merchants even closing their doors; but the intense feeling of the Chinese gradually eased off, and by June 27, normal business could resume again. In other cities, however, the wave of anti-foreign agitation did not so quickly subside. It reached its height in Canton. A great parade of Chinese on June 23, in protest against the Shanghai killings, passed the Shameen, the foreign district, and when firing began on one side or the other, British and French marines turned their machine guns on the demonstrators, killing and wounding between 100 and 200 Chinese participants. A French civilian was killed and three other foreigners were wounded. While there was no further violence, the hostility of the Chinese found expression in a stringent boycott against British trade in Hongkong which lasted for 15 months and for a time practically paralyzed foreign business. Many months later, the

British Government was obliged to arrange for a loan of £3,000,000 to Hongkong to help the city over the crisis. In other parts of China, anti-foreign demonstrations and rioting continued throughout July but gradually subsided into the more peaceful form of boycotts and strikes. The Shanghai shootings, however, were branded deep in the national consciousness and immensely furthered the cause of the Nationalists.

Parallel with this popular growth of national feeling, a series of moves were being made on the international board tending to remove something of the stigma of helplessness which foreign powers had so long held fastened upon China. The tendency in that direction had been particularly marked since the Washington Conference. On Dec. 10, 1922, Japan returned Tsingtao to China against the payment of 14,000,000 gold yen. The Tsingtao Railroad was returned on Jan. 1, 1923, on China's promise to compensate Japan in due time by the payment of 53,000,000 gold marks. A Chinese note of Mar. 10, 1923, requesting the abrogation of the Sino-Japanese Treaties and Agreements of the spring of 1915 was met by Japan with a blunt refusal. (See JAPAN.) Japan maintained her hold on Inner Mongolia and Manchuria and, in the latter province, she was generally credited with being the support of Chang Tso-lin in his open defiance of the Peking government and his wars on other Tuchuns. (See MONGOLIA and MANCHURIA.) The restoration of Wei-hai-wei by Great Britain and of Kwang-chow-wan by France, as promised at the Washington Conference, had not been effected by the summer of 1929, partly because of failure of Great Britain and China to agree on terms of surrender, and in the case of France, partly because of failure to settle the Boxer indemnity dispute.

Whatever impulses the Western powers may have had toward a more liberal attitude in these and other matters, were held in check by the absence of a strong and authoritative government. In particular, this lack of control resulted in two administrative difficulties which served as constant international irritants. These were financial disorders and the bandit problems, due directly to internal strife and Tuchun rule. The Peking government found it increasingly difficult to collect revenues for carrying on the administration and for paying outstanding foreign obligations. The military governors in the interior withheld the taxes and used them for their own selfish purposes, while certain lucrative revenues, such as the customs duties and the income from the salt gabelle, were pledged as securities for foreign loans. At the same time, the financial supervision of the consortium struck a snag because the Chinese government refused to give the guarantees which were regarded as absolutely necessary for the stabilization of Chinese finances.

The bandit problem was no less vexing. Endless civil wars and Tuchun rule had resulted in a tremendous increase of the mercenary soldiery fighting for one or the other of the many factions. On the failure of the chieftains to pay their undisciplined hosts, or on their disbanding, these soldiers resorted with arms in hand to open banditry. For lack of authority, the central government was either unable or unwilling to cope with the situation. Consequently, murder, rape, and robbery were almost daily occurrences. Many cases of kidnaping of

foreigners, particularly of missionaries, took place during these years of turmoil.

The most flagrant instance was the derailing of the Shanghai-Peking Express on May 6, 1923, which resulted in the abduction of some 300 passengers, including 20 foreigners. This affair elicited sharp protests from the Powers. After dilatory tactics on the part of the Peking government, the foreign prisoners were released some months afterward. Claims for damages were filed, but it was not until Feb. 21, 1925, that the Peking government settled the most important of these claims by paying \$300,000 in silver to the dean of the diplomatic corps. The American claims covering material and moral damage amounted to \$144,000.

This same year of 1925 saw also other important steps taken to bring greater harmony in the relations of China with the Powers. The long-drawn dispute with France referred to above, which arose when China insisted on paying her Boxer indemnity obligations in depreciated French paper instead of gold francs, was settled, on April 12, by an agreement under which unpaid installments were to be used to rehabilitate the Banque Industrielle de Chine and payments due in the future were to constitute a loan to the Chinese government in terms of American dollars. On June 30, Great Britain provided for the use of future Boxer indemnity payments for purposes mutually beneficial to the two nations.

With the settlement of the dispute with France, that country ratified the treaties of the Washington Conference relating to China, and the way was finally cleared for carrying out the treaty provisions calling for a conference of the Powers for the purpose of raising Chinese customs duties, in general, from 5 per cent to 7½ per cent. This conference met October 26, and the Chinese delegates immediately presented a demand for full tariff autonomy. This was eventually conceded by the Powers, with the effective date set at Jan. 1, 1929, and with insistence by the Powers that "likin" taxes were to be abolished at the same time; but disagreement as to interim rates kept the conference in session over many months. The Chinese delegates ceased to attend the sessions and the conference finally faded out without settling the question; but both the Peking and the Canton governments, over the protests of the Powers, in due course placed the 2½ per cent surtax on imports.

Another provision of the Washington Treaties was carried out when the signatories followed Secretary Kellogg's initiative in appointing representatives to an extraterritoriality conference. This conference met in Peking Jan. 12, 1926, and continued its investigations for eight months. On September 16, it made its report, which included recommendations that the Powers might consider the progressive abolition of extraterritoriality privileges when China had adopted specified reforms in her judicial system, and pending such action that Chinese laws should be followed, so far as practicable, in the procedure of the extraterritorial courts.

While these efforts at adjustment with the Washington Conference participants were in progress, Russia had been pursuing a policy of her own toward both the North and the South. Russian influence and aid were effective factors in promoting and maintaining the Kuo Min-tang. In July, 1925, General Borodin, Russian Com-

munist, was appointed adviser to the Nationalist government. While his connection with the Russian government remained for a while unknown to the public, it was later disclosed that the Russian Embassy was supplying him with funds. Following the agreements of 1924, Russia made her Peking representative an ambassador; but relations with the Peking government were of an uncertain friendliness. The open sympathy of the Russian authorities with the Kuo Min-tang brought very strained relations with such Northern leaders as Chang Tso-lin, who was bitterly opposed to Communism. It led to a raid on Russian Embassy buildings in April, 1927, and the seizure of secret documents, and to much friction over the control of the Chinese Eastern Railway.

In June, 1926, China took a significant step when she gave notice to Belgium that the Treaty of 1865, due for revision in October, would be abrogated. This was the first of the long string of "unequal treaties" which China attempted to cancel. These treaties were a major grievance with all Chinese factions, since it was through them that foreign nations, large and small, enjoyed numerous privileges predicated on Chinese weakness. They included extraterritoriality privileges, maintenance of foreign postal services on Chinese soil, restriction of customs rates to 5 per cent, maintenance of bodies of foreign troops in China and of war vessels in Chinese waters, establishment of autonomous communities of foreigners in certain cities, control over banks and railways, etc. While the war had cancelled these privileges in the case of Germany and Austria, and Russia had renounced them, other powers were slow to surrender them. Belgium protested the unilateral abrogation of the Treaty of 1865 and referred the controversy to the Permanent Court of International Justice, but early in 1927 withdrew the case and began negotiations with Peking for a new treaty.

While these events were taking place, the interminable struggle for control continued with little pause. In the South, a Yunnanese army occupied Canton and on June 6, 1925, its leader, General Yang Hsi-min, opened hostilities on the Kuo Min-tang. By June 12, however, the latter was completely victorious, driving the Yunnanese with great slaughter from the city. In the North, the career of Chang Tso-lin, lord of Manchuria, came near being ended when a rebellion by General Kuo Sung-lin failed of success, as reported, only through the timely extension of aid to Chang by the Japanese. As it was, Kuo Sung-lin was defeated and executed, with his wife, in December, 1925. In December also, Feng Yu-hsiang attacked and defeated General Li Ching-lin, governor of Chihli, and captured Tientsin from him. Li was allied with Chang Tso-lin, who sent him munitions but too late.

It appeared to be only a question of time before the two victorious generals, Feng and Chang, would battle for supremacy, particularly as the former was now definitely allied with the Southern Nationalists. The clash came on Jan. 19, 1926, and resulted in a defeat for the Manchurian general. General Wu Pei-fu, however, came to his assistance and with the help of General Li Ching-lin, who brought an army from Shantung, the new allies forced Feng first out of Tientsin to Peking, and then out of the capital to Kalgan. Here the Kuominchun, or

Nationalist army, remained until August 16, when it retired in good order into Mongolia. In March, these hostilities almost precipitated an international crisis, when the Kuominchun fortified the Taku forts at the mouth of the Pei River, which leads to Tientsin and Peking, and stopped all river traffic. The United States, Great Britain, France, Italy, and Japan joined in a protest that this action violated the Boxer protocol of 1901 by which free communication between Peking and the sea was to be maintained. The protest was effective and the river was cleared. President Tuan Chi-jui's position, however, was still further weakened by the incident and when his supporter, Feng Yu-hsiang, was driven from Peking, he was deposed.

The varying fortunes of the warring factions in the North were soon rendered of secondary significance by the military developments of the South. While the antagonism of the Right and Left groups in the Kuo Min-tang grew sharper (following the death of Sun Yat-sen), it did not for the time being prevent unity of action in military affairs. In May, 1926, the Southern Nationalists were materially strengthened by the addition of the army of Tang Sheng-chi, who deserted Wu Pei-fu. With this aid, Chiang Kai-shek, commander-in-chief of the Cantonese forces, was able to advance rapidly northward. In July, the combined armies recaptured Changsha, in Hunan Province, which a short time before had been lost to Wu's troops, and proceeded northward toward Hankow. The rapid progress of the Southern forces brought Wu hurriedly from the North to take personal charge of the defense; but his army crumbled away before the advancing Nationalists, who, in September, reached Hankow, on the Yangtze River. That important centre, together with the neighboring city of Hanyang, were surrendered to the Nationalist armies on Sept. 7, but nearby Wuchang resisted the besiegers until October 10. Meanwhile, Chiang Kai-shek continued his triumphant advance. Wu Pei-fu's army melted away before him and the general himself was forced to retire to Chengchow. A more formidable army now appeared to check the onrush of the Southern troops. This was the force of General Sun Chuan-fang, military governor of Kiangsu Province and of Shanghai. On March 30, he had proclaimed the independence, under his control, of the five provinces of central China—Kiangsu, Chekiang, Anhwei, Kiangsi, and Fukien. As between the North and the South, he had remained neutral until the successes of Chiang Kai-shek brought the Nationalist to the borders of his territory. Then he made common cause with Wu Pei-fu and Chang Tso-lin. His army engaged that of Chiang in September and October with varying success.

The Nationalists had a most powerful ally in the sympathy of Chinese generally with their central idea of "China for the Chinese." Operating behind the lines of the enemy, it tended to disintegrate the opposition and detach great numbers of enemy troops. Wholesale desertions wiped out the greater part of Sun Chuan-fang's army, and when two columns of troops were directed against Chiang Kai-shek from the North, both encountered such opposition that they failed to reach their destination. By the close of 1926, Chiang held control of most of the territory south of the Yangtze, including the greater part of the provinces of Kiangsi, Fukien, and Chekiang, and was threatening

Shanghai. After the capture of Hankow, the seat of the Nationalist government was moved to that city from Canton.

The dramatic and spectacular success of the Nationalist armies brought swift repercussions in the foreign offices of the Powers, among the populace of China, and in the ranks of the Kuo Min-tang itself. Great Britain on Dec. 25, 1926, made public a memorandum handed by the British chargé d'affaires in Peking to the representatives of the "Treaty Powers" in which a new "constructive policy" was suggested, including practical recognition of the government of the South, immediate consent to the imposition of the "Washington surtaxes" on all imports into the country, a liberal attitude with regard to extraterritoriality and the abandonment of the foreign control over the "concessions," etc. It proposed, however, that the Powers should act in concert, and this suggestion, together with orders for further large troop movements to China, added to the suspicion in China that the real object of Great Britain was to form a united diplomatic front in opposition to the rising tide of nationalism. On the other hand, the memorandum was received with marked dissent in both France and Japan because its liberal concessions, in the words of the semi-official Paris *Matin*, were "flagrantly inopportune." On December 28, the French cabinet refused to accept the suggested collaboration.

The attitude of Japan, which was particularly concerned about the tariff increases, was much the same as that of France. Failing to obtain united action by the Powers, Great Britain accepted the Nationalist suggestion of separate negotiations and submitted an offer of liberal concessions; but the Nationalist Foreign Minister, Eugene Chen, refused to continue negotiations because of the British show of military force. On Jan. 26, 1927, Secretary Kellogg issued a statement defining the position of the United States in which he asserted that the United States Government desired to deal with China "in a most liberal spirit" and expressed a readiness to continue negotiations on extraterritoriality and customs in company with the other Powers, or to take up negotiations on behalf of the United States alone, as soon as China could agree on delegates representing the people or the authorities of the whole country.

All the Powers maintained their right to protect their own nationals in the disturbed areas. The need for such protection at this time was particularly pressing. Throughout China the successes of the Nationalists had raised a storm of anti-Christian and anti-foreign agitation, attended frequently by threatening demonstrations and actual mob violence. European and American refugees came in increasing numbers from the interior to the coast cities where they could rest under the protection of foreign warships and troops. Religious bodies took steps to remove their missionaries from the more isolated stations.

So full of menace did the situation become that the American Minister, on Jan. 13, 1927, advised American citizens throughout the interior and the South to seek protection in the coast cities. The United States dispatched further naval vessels and marines to the Far East and other Powers took similar action, Great Britain ordering 20,000 additional troops to Shanghai. Early in January, the British concessions in Hankow and Kiukiang were overrun

by mobs. On March 24, when the Nationalists entered Nanking, a systematic attack was made on foreigners there. Seven persons were killed, including one American, the American and Japanese consulates were entered and damaged, and the British, Japanese, and American consuls were fired upon. British and American citizens, including the American consul, took refuge in buildings of the Standard Oil Co., and when they were fired upon there, gunboats of the United States and Great Britain lying nearby on the river shelled the city for a short time until the persons under attack could be removed to the vessels. Although there was little loss of life, the Nanking incident greatly intensified the hostile feeling toward foreigners throughout the country and on the other hand brought sharp communications from England and America to the Nationalist government and the lodging of claims which were eventually fully satisfied.

In the meantime, the Nationalist military forces were continuing their triumphant advance with Shanghai as their immediate objective. In January, they occupied the province of Anhwei and on February 17 captured Hangchow. Continuous Nationalistic propaganda in enemy territory, threats of strikes by workers in cities they approached, and the defection to their cause of one military leader after another as they advanced greatly helped their forward progress. Their Northern commander, Feng Yu-hsiang, likewise threatened with an army of 50,000 the rear of the opposing armies, which now comprised the forces of Chang Tso-lin, Chang Tsung-chang, Governor of Shantung, and Sun Chuan-fang, late governor of the "five provinces."

Shanghai was finally occupied on March 21, when the general in command came over to the Nationalists. Two days later, Nanking was captured and Chiang Kai-shek began preparations for the final drive on Peking. By this time, the antagonism of the moderates and the communists within the Kuo Min-tang organization had deepened to the point of an open rupture. Chiang Kai-shek, as leader of the moderates, definitely broke with the communists and set up his own government at Nanking in opposition to the Hankow government of the extremists. The move aligned the army of Tang Seng-chi with his foes, but Chiang nevertheless continued his advance northward. In addition to Feng Yu-hsiang, he now had as allies Wu Pei-fu and the "model governor" of Shansi Province, Yen Hsi-shan, who cast in his lot with the Southern cause.

By May 30, Chiang's army had taken Pengpu and Suchow and was threatening an advance into Shantung. Early in June, the Northern forces retreated across the Yellow River. With the Northern cause apparently desperate, rumors of peace negotiations and an alliance between Chang Tso-lin and Chiang Kai-shek on the basis of Sun Yat-sen's principles were heard but were sharply denied by the latter. In the middle of June, Chang Tso-lin was constituted dictator of the Northern forces and the Peking government. Toward the close of June, Feng Yu-hsiang and Chiang Kai-shek met in Suchow to plan a concerted advance on Peking; but in July, the defense of Shantung suddenly stiffened. The Northern army concentrated on an attack on Suchow and, after prolonged and bitter fighting, recaptured the city. It marked the turn of the tide. Chiang Kai-shek, driven back from one position after another, resigned his command

on August 15, because of his reverses and in order to preserve harmony in his party, and later retired to Japan.

Under General Sun Chuan-fang, the Northern army now advanced until it threatened Nanking and Shanghai; but their desperate situation rallied the Nationalists and they first stopped the enemy advance and then gradually pushed the Northern army back until by the middle of December they were again in possession of Suchow. Once more successful, the Nationalist leaders insisted on the return of Chiang Kai-shek to the command of their forces and he consented, but stipulated that he was to retire when the military victory should be complete. On both sides, the early months of 1928 were spent in preparations for a renewal of the conflict. In April, the Northern general, Sun Chuan-fang, attacked Feng Yu-hsiang, but the latter's army counter-attacked and in conjunction with the forces of Chiang Kai-shek inflicted a severe defeat on the Northerners. On May 1, Chiang Kai-shek captured Tsinan, capital of Shantung Province; but the victory immediately brought a clash with the Japanese, who had moved considerable forces to Shantung, and on their orders he was forced, under protest to the Japanese Government and to the League of Nations, to evacuate the city. He then turned toward Peking, but events made it unnecessary for him to advance on the capital. Faced by converging Nationalist armies, Chang Tso-lin did not await the attack but on June 3 (it is believed on the advice of the Japanese) left the city with his cabinet for Manchuria. When his train neared Mukden, it was bombed and he died shortly afterward from his injuries. There was strong evidence that the Japanese were concerned in the plot. On June 5, General Yen Hsi-shan, Governor of Shansi, occupied Peking with his Nationalist army, and the full triumph of the Nationalist cause was assured. The death of Chang Tso-lin removed the last great obstacle to the consolidation of the country under the Kuo Min-tang. Although there was some further scattered fighting, the opposing armies soon melted away. Chang Tso-lin's son and successor, Chang Hsueh-liang, received the representatives of the new régime cordially and readily acknowledged the authority of their government over the whole of China. On the insistence of the Japanese, he delayed announcing his adherence for several months, but, on December 29, he raised the flag of the new government over his palace instead of the old flag of the Republic.

With the military victory completed, the Nationalist leaders turned at once to the task of reconstruction. Peking was abandoned as a capital and renamed Peiping, and the seat of the new government was placed at Nanking. Without waiting for the formal organization of a new constitutional government, the United States, on July 25, signed a treaty with China recognizing the Nationalist régime and its complete tariff autonomy, the Senate ratifying the treaty on Feb. 11, 1929. Before the close of the year, twelve nations in all had taken action of this kind with respect to the tariff, stipulating only that no nation should enjoy greater tariff benefits than the signatories of the treaties. They included the United States, Germany, Norway, Belgium, Italy, Denmark, Portugal, the Netherlands, Great Britain, Sweden, France, and Spain. Five of these—Italy, Belgium, Spain, Denmark, and Portugal—had

also pledged themselves to abandon extra-territoriality by Jan. 1, 1930.

On October 3, the basis for a new government was laid by the promulgation of a new constitution (which, however, was declared to be provisional in character) creating five branches of government, executive, legislative, judicial, examination (for testing candidates for public position), and control (for exercising powers of impeachment and auditing). The President and Vice President were provided for as heads of the executive branch and presumably of the nation itself. On October 9, the Executive Committee of the Kuo Min-tang elected Chiang Kai-shek President, and he announced a cabinet which included the following: Minister of Foreign Affairs, C. T. Wang; Finance, T. V. Soong; War, Feng Yu-hsiang; Agriculture, Yu Pei-chi; Industry, H. H. Kung; Education, Chiang Meng-ling; Railways, Sun Fo; Interior, Yen Hsi-shan; Communications, Wang Po-chun; and Health, Hsueh Tu-pi.

These officials applied themselves at once to the task of making China a unified state which could take its place as an equal in the family of nations. Among the first moves in that direction was the promulgation on Dec. 10, 1928, of a new schedule of import tariffs to go into effect Feb. 1, 1929. They covered practically all articles of import and were drawn up to provide revenue rather than protection, with a moderate range of 7½ to 59 per cent. Japan alone held out against any new rates until her old treaty with China should be abrogated by mutual consent, but finally accepted them on the day before they became effective. Foreign administration of the customs machinery was not affected by tariff autonomy. In January, 1929, an attempt was made to form a practicable plan for cutting down the country's military forces by nearly a million men. The major policies of the Government were directed toward centralizing administration of the country in the capital, particularly with respect to financial and military matters. The first formidable challenge to its authority came in the shape of a revolt by General Chang Tsung-chang, former Governor of Shantung. It centred around Chefoo. Hostilities began on February 21 and for a while the rebel forces made some headway; but in May they were defeated by the government general, Liu Chen-nien, and Chang Tsung-chang fled to Japan. Another revolt in Hankow was quickly put down. More dangerous than these actual outbreaks was the disaffection of Feng Yu-hsiang, who resigned his post as Minister of War in the spring of 1929. Antagonism between Feng and his following and the official government led by Chiang Kai-shek grew greater until, in May, it was reported that Feng was on the verge of beginning war on the Nanking government. By a resolution of the Central Executive Committee of the Kuo Min-tang on May 23, Feng was dismissed from all official connection with the Government and a punitive mandate against him was authorized. The situation did not reach the stage of open warfare, however, and in midsummer it was reported in the press that he was being sent abroad by the Government on an extended mission of study. Disorders occurred in Canton in May, when Kwantung forces were obliged to defend that city against an attack by a Kwangsi faction. On May 30 occurred the final act in the history of Japanese occupation of Shantung,

when the last of the Japanese troops departed from the province. On June 1, an elaborate state funeral was held at Nanking for Dr. Sun Yat-sen, whose body had been brought down from near Peiping. Throughout the first half of 1929, a very severe famine prevailed in central China affecting tens of millions of Chinese. See *RUSSIA*, under *History*.

**CHINA, ANCIENT CIVILIZATION OF.** See *ETHNOLOGY*.

**CHINARD, shîn'ar', GILBERT** (1881- ). A French philologist who was born in Châtelleraut and studied at Poitiers and the Sorbonne. He was instructor of French at the College of the City of New York in 1908, then for four years at Brown University, and from 1912-19, professor at the University of California. After 1919, he was at Johns Hopkins, where he was joint editor of the *Johns Hopkins Studies in Romance Literature and Languages*, and professor of French literature after 1925. His publications include: *L'exotisme américain dans la littérature française, au XVIème siècle* (1911); *L'Amérique et le rêve exotique* (1913); *L'exotisme américain dans l'œuvre de Chateaubriand* (1918); *Chateaubriand, Les Natchez* (1919); *La doctrine de l'Américanisme* (1919); *Volney et l'Amérique* (1923); *Jefferson et les Idéologues* (1925); *Les réfugiés huguenots en Amérique* (1925); *The Common Place Book of Thomas Jefferson* (1926); *Destutt de Tracy, de l'Amour* (1926); and *Les amitiés françaises de Jefferson* (1927).

**CHIROL, chîr'ol, SIR VALENTINE** (1852- ). An English journalist and writer on the Orient (see *VOL. V*). His later works include: *Ocül Spring-Rice: In Memoriam* (1919); *The Egyptian Problem* (1920); *India, Old and New* (1921); *The Occident and the Orient* (1924); *India (Modern Nations Series, 1926)*; and his reminiscences, *Fifty Years of a Changing World* (1927).

**CHIROPRACTIC.** A system of preventing and healing disease by manipulation which followed the success of osteopathy but which its practitioners assert to be of independent origin and derived by its originator, D. D. Palmer, from discoveries made accidentally during so-called magnetic healing. At first, a practitioner of the latter and conductor of a school of magnetic healing, D. D. Palmer, then of Davenport, Iowa, changed his methods to what he designated as a chiropractic. He soon established his cult in Oklahoma, where he opened a college. This period, from the accidental discovery until the establishment of the school, covered the decade 1895-1905. Palmer later removed to California and continued his practice there until his death at San Diego in 1913. Disputes arose as to the legitimate successor of Palmer and also as to the essential features of chiropractic. B. J. Palmer, son of the founder, opened a school of Chiropractic at Davenport which turned out thousands of graduates practicing the so-called Palmer method.

It has been admitted by the legitimate chiropractors that many bogus graduates and unqualified practitioners often usurped the name and functions of chiropractic, and they asserted that universal legalization of the practice would be necessary to eliminate this fraudulent element. Owing to the highly technical character of the manipulations of chiropractic, as well as the different conceptions of the-art by its own practitioners, no attempt will be made to describe them here.

Since the introduction of this cult, about 150 schools have been started for qualifying practitioners of chiropractic, but many have closed—no less than 48 in the past few years—and the number functioning in 1928 was said to be only 40 of very unequal facilities for instruction. No less than six exist in California, where the cult flourishes. The best known are the original Palmer School at Davenport, Iowa, with between 200 and 300 annual graduates, the National College of Chiropractic in Chicago, and the Los Angeles College of Chiropractic with an output of about 100 graduates.

At a meeting of chiropractors in Pittsburgh, Feb. 26, 1928, B. J. Palmer complained that 80 per cent of the chiropractors in Pennsylvania were practicing medicine, and that this defection meant the downfall of the cult as such. During the preceding 18 months the supreme courts of seven States had handed down legal injunctions whereby the cause of chiropractic was permanently lost. Bills for legalizing the cult have been lost in the legislatures of New York, Massachusetts, Pennsylvania, and the District of Columbia, while licensing boards have been recognized in Kentucky and Indiana.

**CHITTENDEN, RUSSELL HENRY** (1856- ). An American physiological chemist (see *VOL. V*). During the World War, Chittenden was a member of the Advisory Committee on Food Utilization and also a member of the executive committee of the National Research Council. He edited the *United States Report of the Inter-Allied Scientific Commission* (1918). In 1922 he was made emeritus professor of physiological chemistry at the Sheffield Scientific School, Yale University.

**CHLOROPHYLL.** See *BOTANY*.

**CHODAT, shôd'â, ROBERT** (1865- ). A Swiss botanist (see *VOL. V*), director of the Botanic Institute, The Alpine Garden "La Linnaea," and the laboratory of Alpine biology at Bourg-St.-Pierre. In 1914 he was made a member of the Linnean Society and in 1918 director of l'Herbier Boissier. His later works include: *Végétation du Paraguay* (1916-1921); *Biologie des Plantes* (1917); another volume of *Principes de botanique* (1920); and *Scenedes mus, monographie* (1926).

**CHOLECYSTOGRAPHY.** See *GALL-STONE DISEASE*.

**CHÖSEN.** See *KOREA*.

**CHRISTEN, krës'ten, JOSEFINE** (1869- ). An Austrian sculptor and feminist, born in Bohemia of Czech and French parentage. She studied music and for 13 years was on the operatic stage under the direction of the famous manager, Angelo Neumann. Then she studied art in Prague and later in Paris, and in 1908 settled in Vienna. From 1915 to 1917, she was with the Austrian Army as official sculptor, and in 1918 exhibited her war work. Becoming absorbed in political life, she founded and was president of the Austrian Women Voters' Association. Her principal works are "Cain," "Salome" and "The Consoling Muse." She did many private monuments and exhibited portraits in Paris, Vienna, Turin, etc. Her musical compositions included a mass, some orchestral works, and songs with piano accompaniment.

**CHRISTIAN X, CARL FREDERIK ALBERT ALEXANDER VILHELM** (1870- ). King of Denmark and Iceland (see *VOL. V*). By his personal popularity and tact, he was able during the World War to keep Denmark strictly neu-

tral. In 1915 he approved a new constitution which limited the monarchy, in 1917 Denmark sold the Danish West Indies to the United States, in 1918 Iceland was given greater states rights, and in 1920 Denmark entered the League of Nations. The great event of his reign, however, was the plebiscite which brought back North Schleswig to Denmark. During his reign more than 2500 square miles of useless land were reclaimed to agriculture; a merchant marine was developed; world-wide commercial enterprise launched; and a number of important scientific discoveries were made. See DENMARK, under *History*.

**CHRISTIAN CHURCH.** This denomination changed the name of its administrative body from the American Christian Convention to the General Convention of the Christian Church in 1922. There were, in 1916, 1213 ministers; 1265 churches, including 111 colored; 118,737 members, including 10,120 colored; and 1115 Sunday schools, with 91,853 members. These compared with the following statistics reported to the denomination in 1928: 1113 ordained ministers, including 216 colored; 308 unordained, including 121 colored; 1202 churches, including 173 colored; 118,206 members, including 14,107 colored; 917 Sunday schools with 93,108 members; and 372 Christian Endeavor societies with 8264 members.

The foreign mission work, which has been carried on for some years in Japan and Porto Rico, was extended to South America in 1926. Home missionaries are active in the Western lumber camps and among the Indians, and with Negroes and mountaineers. The Christian Publishing Association, at Dayton, Ohio, in addition to other periodicals, issues one of the oldest religious newspapers in the United States, *The Herald of Gospel Liberty*, a weekly founded in 1808. The denomination maintains eight educational institutions, a home for aged ministers, and an orphanage.

On Mar. 3, 1924, the Commission on Christian Unity of the Church addressed an overture to a number of churches looking toward a corporate unity. As a result of this action, the National Council of the Congregational Church and the General Convention of the Christian Church voted a merger of the two denominations, to be known as the General Council of the Congregational and Christian Churches, which came officially before the two bodies in 1929. The enterprises of the two denominations are being combined as rapidly as the necessary legal adjustments can be effected.

**CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF.** Founded in 1881 as the United Society of Christian Endeavor, the name was changed in August, 1927. It is an interdenominational society designed to train young people for church membership and church work. Departments of Christian vocations, and of travel and recreation were added in 1927 to the four groups, junior, intermediate, and senior societies, and alumni council, into which the activities of the organization were previously divided. The number of societies throughout the world increased from 75,000 in 1914 to approximately 80,000 with 4,000,000 members by 1929. In the latter year, the International Society included branches in over seventy countries besides the United States and Canada. The Comrades of the Quiet Hour, who devoted themselves to a definite period of prayer and meditation each

day, increased in membership from 168,779 in 1918 to 252,622 in 1927; and the Tenth Legion, whose members gave one-tenth of their incomes to religious work, increased its membership from 51,302 to 73,859. A biennial convention of the Society was held at Kansas City, Mo., July 3-8, 1929. The headquarters of the society are at Mount Vernon and Joy Streets, Boston, Mass.

**CHRISTIANIA.** See OSLO.

**CHRISTIAN SCIENCE.** During the years 1915-28, the Christian Science denomination continued and increased its previous progress. In the first thirty-five years of the Christian Science movement (1879-1914), the number of organized congregations (churches and societies) grew from one to 1488. During the fourteen years from the beginning of 1915 to the end of 1928, this number increased from 1488 to 2382. Of the last mentioned number, 1997 were in the United States, 185 were in Great Britain and Ireland, 61 were in Canada, 38 in Germany, 17 in South Africa, 14 in Australia, 12 in Switzerland, 9 in New Zealand, 4 in France, 4 in Holland, 3 in Sweden, and 38 in other countries. At the end of 1928, there were 9589 Christian Science practitioners accredited as such by the Christian Science Mother Church, the First Church of Christ, Scientist, in Boston, Mass. At the same time, the number of Christian Science teachers authorized by The Mother Church was 306.

One of the most notable developments during the period under review is the growth of Christian Science Sunday Schools. In the early history of this denomination, children attended Sunday services with their parents. Afterwards, only the larger churches had Sunday Schools. In recent years, however, each church and society has conducted a Sunday School for pupils up to the age of twenty years. Now, it is not unusual for the number of children in a Sunday School to equal or exceed the number of adult members in the church or society, and more than a few of the pupils in these schools have parents who are not interested in Christian Science for themselves.

Another notable development during the period 1915-18 has been the increased appreciation and respect for Christian Science shown by the public. Criticism and misapprehension of this religion have diminished, attendance at its church services and lectures has increased steadily. So has the demand for Christian Science literature (the writings of Mary Baker Eddy and the periodicals issued by The Christian Science Publishing Society); so has the inquiry for Christian Science healing and the acknowledged results thereof. Acquaintance with Christian Science and interest in this subject have been greatly extended by the radio broadcasting of church services and lectures, which is now done extensively and regularly.

Notable, also, have been the recognitions given to Christian Science by national and state governments. For instance, there have been chaplains in the United States Army and Navy, and numerous acts of legislative bodies have implied that Christian Science treatment has acquired a permanent place among remedial practices. Thus, the United States Congress, when legislating for the District of Columbia, and the legislatures in most of the United States have applied religious freedom to the practice of Christian Science, either explicitly or in general terms. The same can be said for several of the

Canadian Provinces; and in England, where Christian Science is not so well known, the British Parliament, when passing the Nursing Homes Registration Act, 1927, exempted Christian Science houses from medical requirements.

During the period 1915-28, the Christian Scientists developed and extended their unique agency, the Christian Science reading room. Each Church of Christ, Scientist, provides, at a place convenient for the public, at least one reading room where anybody who desires to do so may read or study the Bible with the books and periodicals which constitute the authorized literature of Christian Science, or may enjoy an interval of meditation and rest. In the larger cities, each of the local churches has a reading room in its own vicinity, while all of them unite in maintaining one or more reading rooms in central locations; and the quiet welcome to be found at these rooms is accepted by a large and increasing number of people who may or may not be affiliated with Christian Science.

During the years 1915-28, the growth and permanency of the Christian Science denomination has been evidenced remarkably by the increased number of church edifices. Almost without exception, the meetings of this denomination in Boston and elsewhere began in rented halls. Now, many or most of the branch churches have followed the example of The Mother Church in erecting and owning their own buildings. Always designed to be of churchly type, many of these edifices are notable for beauty as well as adaptation to Christian Science services.

In 1920 The Christian Science Benevolent Association opened a large sanatorium in Brookline, Mass., which was under the auspices of The Mother Church. As enlarged since then, it furnishes accommodations for 148 guests, who may go there either for care while in quest of Christian Science healing or for recuperation and rest. A site for a similar institution has been acquired at San Francisco which is also to be under the auspices of The Mother Church. At many other places, homes for the care of patients under Christian Science treatment are conducted by Christian Scientists as personal undertakings, the practice of Christian Science healing being always regarded as an individual ministry.

Another institution opened in 1927 under the auspices of The Mother Church is The Christian Science Pleasant View Home. This is a home for elderly Christian Scientists on the site near Concord, N. H., where Mrs. Mary Baker Eddy resided from 1892 to 1908. As now constructed, the main building has accommodations for 150 residents and employees, and is surrounded by grounds comprising about 100 acres. An auditorium seating 150 is used for Christian Science services; the dining-room, large enough for 200 persons, anticipates additional buildings or extensions. Admission to the home depends on length of service and creditable work for Christian Science.

In recent years, the Christian Science Mother Church has encountered persistent opposition from former members still claiming to be Christian Scientists. Controversy and litigation have resulted, but the attitude of The Mother Church has been consistently defensive, and neither its position nor its progress appears to have been impaired.

**CHRISTIANS.** See **CHRISTIAN CHURCH.**

**CHRISTIE, GEORGE IRVING** (1881- ). An American educator, born at Winchester, Ont.,

Canada. He graduated from Iowa Agricultural College in 1903 and since 1905 has been connected with the agricultural department of Purdue University as superintendent of agricultural extension, director of the Agricultural Experiment Station, and director of the Summer School for Teachers. He was State Food Director for Indiana, 1917-19, and assistant Secretary of Agriculture, 1918-19. He was also a member of several important boards relating to agriculture during the World War. Since 1919 he has been superintendent of the International Grain and Hay Show.

**CHRISTY, HOWARD CHANDLER** (1873- ). An American painter (see VOL. V). He returned to portrait painting in 1920 and painted portraits of Will. H. Hays, George Harvey, Post Wheeler, and others. He also painted portraits of the late President Warren G. Harding, former President and Mrs. Coolidge, Charles E. Hughes, Premier Mussolini, Crown Prince Humbert of Italy, and many others.

**CHROMOSOMES.** See **ZOOLOGY.**

**CHUBB, PERCIVAL** (1860- ). An American educator (see VOL. V). He was president of the Drama League of America from 1915 to 1917 and from 1918 to 1920.

**CHURCHILL, CHARLES SAMUEL** (1856- ). An American railway official, born in New Britain, Conn. He graduated from the Sheffield Scientific School in 1878 and, from 1879 to 1881, was engaged in surveys and railroad construction in Connecticut and Pennsylvania. He served as superintendent of construction and as engineer of many important railroads in the Middle West and, from 1918 to 1926, was vice president of the Norfolk & Western Railroad. He was chairman of commissions representing the Southern group of railways on Federal valuation, in 1913. An authority on the ventilation of railway tunnels and on the testing of materials, he was a frequent contributor of technical articles to engineering publications and a member of several scientific and engineering societies.

**CHURCHILL, WINSTON** (1871- ). An American author (see VOL. V). His most recent works include: *A Far Country* (1915); *The Dwelling Place of Light* (1917); *A Traveller in War-Time, with an Essay on the American Contribution to the Democratic Idea* (1918); *Dr. Jonathan*, three-act play, (1919); and *The Crisis* (1921).

**CHURCHILL, THE RT. HON. WINSTON LEONARD SPENCER** (1874- ). An English statesman (see VOL. V). At the outbreak of the World War, he was First Lord of the Admiralty but was forced to resign in 1915, and was then appointed Chancellor of the Duchy of Lancaster. After brief service in the army, he was made Minister of Munitions, 1917-18. He was blamed for the Dardanelles disaster of 1917, but never

theless served as Secretary of State for War and for Air (1918-21). He was Secretary of State for the Colonies (1921-22). From 1924 to the advent of the Labor Government in June, 1929, he was Chancellor of the Exchequer in the Conservative ministry, having turned from the Liberal Party in order to oppose socialism. In 1925, under his administration, Great Britain returned to the gold standard. He wrote: *The World Crisis* (4 vols., 1923-27), of which a large part is a defense of his policies as First Lord of the Admiralty, and *The World Crisis: The Aftermath* (2 vols., 1928, 1929).

**CILICIA.** This region in southeastern Asia Minor was the centre, after the World War, of Armenian nationalistic aspirations and later of French imperialistic schemes. It was occupied by the British-French forces in their triumphant march north in 1918; its control fell to the French in 1919 in accordance with the terms of the secret Sykes-Picot agreement of May, 1916. The later discredited Sèvres Treaty of 1920 put the stamp of approval on the occupation by assigning a portion of Cilicia to the French mandate territory of Syria. A secret treaty, signed at the same time by France, Great Britain, and Italy, protected France in her rights in the rest of the territory by means of a zone of influence. Armenians flocked there in the hope of gaining asylum, as well as possible French support in operations against the Turkish Nationalists who late in 1920 were moving against their compatriots in the East. The French policy had veered about, however. Rather than manifest an interest in Armenians, the French bent all their energies to conciliating the Turks. The Turks, strangely enough, were unyielding, and French attempts at the pacification of Cilicia were stubbornly resisted in 1920-21. The policy proved wasteful and ill-advised, and from March, 1921, the French tried to withdraw as gracefully as they might. Finally, on Oct. 20, 1921, France and the Angora government signed a treaty which provided for the evacuation of Cilicia. (See **TURKEY**.) A subsequent agreement provided for the protection of the Christian populations, the postponement of military conscriptions, and the creation of a Franco-Turkish commission with Cilician representation for the safeguarding of property. By Great Britain, the step was regarded with hostility, for it meant a further repudiation of the Entente as well as the endangering of British interests in the Near East. The boundary between Syria and Turkey, as fixed by the Treaty of Oct. 20, 1921, was written into the Treaty of Lausanne of July 24, 1923. Cilicia thus once more reverted to Turkey.

**CINCINNATI**, sīn'sīn-nā'tī. The second city of Ohio, ranking eighteenth among cities of the United States. The population increased from 384,745 in 1910 to 401,247 in 1920, and to 413,700 in 1928, by estimate of the Bureau of the Census. Approximately 90 per cent of the population is American born. A home-rule charter was adopted in 1918 by popular vote, and in 1926 the city-manager form of government was accepted, with proportional representation for the nine members of the Council. The City Manager is selected by the Council and receives a salary of \$25,000 a year. One of the Council members, chosen by that body, acts as Mayor.

A rapid transit system is under construction, a portion of it utilizing the right of way of the abandoned Miami and Erie Canal, which was

turned over by the State for the purpose. The completed work will include 2.45 miles of subway, 9 miles of open trackage, 0.2 miles of tunnel, 3.4 miles of concrete trestle and 1.4 miles of concrete elevated structure. The exhaustion of \$6,000,000 provided by a bond issue in 1916 led to a halt in construction in 1928. On Jan. 1, 1929, by charter amendment, the duties of the Rapid Transit Commission passed to the City Manager. Further plans are to be developed. The street railway is privately owned, being operated on a service-at-cost system. A double-deck terminal for interurban electric cars was finished in 1923 at a total cost of approximately \$11,000,000. The Southern Railway, extending 336 miles from Cincinnati to Chattanooga and valued at approximately \$48,000,000 by the Interstate Commerce Commission, is the only railroad in the United States which is municipally owned.

To accommodate nine railroads, radiating from Cincinnati to all sections of the United States, a Union Depot and Freight Terminal to cost \$75,000,000 is being erected. Cincinnati is also a leading airport. Lunken Field, in the eastern part of the city, consists of 953 acres with a 3800-foot runway, while Watson Field, at Blue Ash, consists of 100 acres. The improvement of the Ohio River, with a view to establishing a 9-ft. stage the year round, was completed in 1924 and has proved of special benefit to Cincinnati in the shipment of coal from the Kentucky, Tennessee, and West Virginia fields.

The average number of wage earners in metropolitan Cincinnati's 2094 manufacturing establishments in 1925 was 90,659. The output of these establishments was valued at \$678,700,219. The Bureau of Business Research of Ohio State University estimated the total wage and salary payments for 1926 at \$235,279,000, the second largest in the State. From 1920 to 1926, there was an increase of 24.4 per cent in industrial payrolls and during the same period an increase in manufacturing total wage and salary payments of 6.56 per cent.

The assessed valuation of real and personal property in Cincinnati is \$1,107,000,000, the tax rate for 1928 being \$21.60 per \$1000. In December, 1928, the general bonded debt amounted to \$99,322,580. In 1928 the total value of building permits issued was \$42,661,323, an increase of approximately 13 per cent over the previous year. Cincinnati has 626.33 miles of paved streets and 625 miles of sewers. Recent public improvements include the Central Parkway, which cost \$4,250,000, and the Chamber of Commerce Building, which cost \$2,000,000. Among the bonds approved by vote of the people in 1928 were: \$1,000,000 for the Western Hills Viaduct to be built by the city and the Union Terminal Company, the latter to pay approximately \$2,500,000 and the city \$1,000,000; \$1,000,000 for the widening of Plum Street from the Central Parkway to Second Street, so as to expedite traffic in the central district; \$2,000,000 for the elimination of some 10 important grade crossings; \$300,000 for an outdoor dispensary at the General Hospital; \$500,000 for playfields; and \$100,000 for additional parks.

Cincinnati has 23 banks with a capital of \$26,125,000. Surplus and undivided profits amount to \$31,942,871; loans, \$208,586,710; deposits, \$357,390,010; total resources, \$448,962,024. The per-capita wealth is approximately 4,500,

The churches number 403, with the following in the lead: Roman Catholic, 71; Baptist, 66; Presbyterian, 42; Methodist Episcopal, 41; Protestant Episcopal, 20; Jewish, 18. The extensive public-library system includes one main library and several branches in schools and other agencies, with a yearly circulation of 2,345,919 books. There are 14 other special libraries. The public schools number 65, with an enrollment of 69,753 and the parochial schools, 208 with an enrollment of 45,625. See CINCINNATI, UNIVERSITY OF.

**CINCINNATI, UNIVERSITY OF.** A coeducational municipal institution at Cincinnati, Ohio, founded in 1871. From 1914 to 1928, the student body increased from 1866 to 9001, and 1310 attended the summer session of 1928; the faculty increased from 186 to 571 members; the library, from 96,000 bound volumes and 79,000 pamphlets to 144,648 volumes; the productive funds, from \$1,500,000 to \$6,239,545; and the income, from \$290,000 to \$1,820,821. The College of Commerce was merged with the College of Engineering, which was known thereafter as the College of Engineering and Commerce; the Cincinnati Hospital Training School for Nurses became a department in the College of Medicine in 1916; the Cincinnati Law School became the College of Law of the University in 1918; the School of Household Arts, organized in 1914, was made the department of home economics in the College of Education; a new department of hygiene and physical education was organized in 1916; and a department of leather research and a professorship of surgical anatomy were created in 1921. In 1922 the School of Applied Arts was opened under the direction of the dean of the College of Engineering and Commerce. A chemistry building and a women's building were completed in 1916 and a dormitory for men in 1923; the Alphonso Taft College of Law Building was opened in 1925 and in that year the Tanners' Council of America built a research laboratory in connection with the College of Engineering and Commerce. In 1929 Dean Herman Schneider, Sc.D., was elected president succeeding Frederick Charles Hicks, Ph.D.

## CITY AND REGIONAL PLANNING.

The existence in 1929 of over 700 city-, village-, and regional-planning bodies in the United States where there were none of either twenty-five years earlier, attests the rapid growth of a significant movement caused not only by city growth but also by an increasing consciousness of its many attendant problems. Since about 1920, practical recognition has been given to the fact that planning problems do not stop at city boundaries but extend to large tributary areas which often go beyond county and sometimes pass over state lines; hence, regional planning. In any new field, it is easier to plan than to execute. This is particularly true in one requiring education, then legislation, and then still more education before governing bodies will provide funds to widen and extend streets, to acquire and improve playgrounds, parks and reservations, to provide transit facilities, and to build civic centres or groups of public buildings, suit-

ably placed in parked areas. Consequently, in the city- and regional-planning fields, plans were far in advance of executed projects, or even projects fairly started; and what has gone beyond the paper stage is often piecemeal work. This is due largely to the difficulties of fitting into governmental framework the new parts essential for comprehensive city and regional planning.

In regional planning, the difficulties are still greater than in city planning, because regional areas embrace scores of governmentally independent cities, villages, and rural townships, not co-terminous with counties, often covering several counties, and not easily brought under a single governmental organization because of various obstacles, some human and some constitutional. In both city and regional areas, notably the former, various public improvements have been carried out, each independent of the other, but without much needed correlation, and not always with due regard for the entire area, even for the one class of engineering works—as streets, sewers, water supply, or parks. It is this correlation, through not only a master plan for each class of service but also by means of a grand master plan for all, that is the reason and aim of city and regional planning.

**Zoning.** After some years of city planning, much of which never got beyond the paper stage, partly because done by temporary voluntary bodies instead of by permanent governmental agencies, it became evident that dependable city planning rested on zoning; that is, upon determining, subject to reasonably frequent modification, what parts of a city shall be devoted to residences of various types—single, semi-detached, or apartment—what part to business, what to manufacturing, and where a few classes of industry actually or likely to be nuisances, but essential to at least a large city, shall be allowed. Permissible heights of buildings and percentage of lots built upon also are taken into consideration. Upon use and height of buildings and percentage of the ground covered by them depend density of population, street widths, kinds of pavement, size of water mains and sewers, transportation facilities, size, location and character of schools, playgrounds and parks, telephone and light service. The need for zoning did not become widely apparent until just before the entry of the United States into the World War.

The fact that zoning requires no construction outlay and comparatively little operating expense and that it prepares the way for the more orderly, more economical, and more efficient construction of several kinds of municipal works facilitated zoning at a time when many other municipal activities were almost at a standstill. Although not known by that name at the time, zoning in America was begun as early as 1904 by Boston, following State enabling legislation of 1898 and 1904 which empowered Boston to limit the height of building near the Public Library on Copley Square. In 1909 Los Angeles instituted zoning in a limited way. Two other cities zoned in 1913. In 1915 zoning was adopted by Neenah, Wis. What gave it its real start in America was the exhaustive study of the subject made in New York City, followed by the adoption of a remarkably complete zoning ordinance in 1916, under the State Enabling Act passed two years earlier. Two more cities adopted zoning in 1916 and four in 1917.

At the close of 1920, there were 38 zoned cities, and in the next year the number doubled. Prog-

ress was then rapid, so that at the end of 1928, according to figures gathered by the U. S. Department of Commerce, there were 742 zoned cities. These cities were located in 44 States and the District of Columbia. The only States without at least one zoned city in 1928 were Vermont, West Virginia, Montana, Wyoming, and New Mexico.

The distribution of the 742 zoned municipalities by States and years is shown by the accompanying table, compiled by the Division of Building and Housing of the U. S. Department of Commerce. New York led with 132 zoned cities, and was followed by New Jersey with 84; California, 72; Illinois, 66; Massachusetts, 62; Pennsylvania, 42; Ohio, 39; Michigan, 31. These eight States had 528 of the 742 zoned cities. It should be understood that the character of zoning varies greatly from city to city. These variations have been indicated in a list of zoned cities, by States, giving also dates of the various ordinances, which has been issued and revised from time to time by the U. S. Department of Commerce.

Zoning is effected by a city ordinance. When comprehensive, it prescribes the percentage of the area of lots which may be covered with buildings or sets a minimum limit on the depths of front and rear and the widths of side lots; the heights to which buildings may be carried, either specifically or in relation to street widths, but generally with provisions for towers and for carrying other limited parts of a building above the main cornice line by means of one or more setbacks; and the classes of buildings that may be erected, as, for instance, residence, business, or industrial. Generally, there are two or more subdivisions in each main class. For instance, there may be single-family, two-family, and apartment-house residence districts, or even many more subdivisions in this class.

**Constitutionality of Zoning.** The legal basis of zoning is the police power. Reliance should not be placed on the general grant of police powers by the State to the city but rather in specific State zoning legislation, preferably but not necessarily applicable to all the municipalities of the State. Since there was no such thing as zoning when many of the State constitutions were adopted, it has been considered necessary or advisable to secure constitutional amendments authorizing zoning in some States. Broadly, the power to authorize zoning rests with each State legislature, subject to the limitations of the constitution of its own State, and of the United States. A standard or model State-zoning enabling act was drawn in 1922 by a committee of experts appointed by Secretary of Commerce Hoover, and has been revised from time to time since. Acts modeled wholly or partly on this standard have been passed by many States.

Prior to the sweeping decision of the United States Supreme Court in the *Euclid* case (1926), summarized below, upholding the broad principles of zoning, State court decisions were in some cases strongly adverse to zoning and in others equally strong in support of its legality under the State constitution, depending largely upon the conservatism or broad social vision of the State judges. The *Euclid* decision established the fundamental principles of zoning so firmly as to leave little to the Federal district and State courts except to rule the reasonableness of properly drawn and equitably enforced zoning

ordinances. In 1923 there were two adverse decisions in the *New Jersey* Supreme Court, and one in the *Missouri* Supreme Court, while the *Louisiana* and *Wisconsin* courts upheld local zoning ordinances. The two adverse decisions in New Jersey were limited in application compared with those in the three other States. They were upheld on appeal, but in 1927 a State constitutional amendment giving authority for zoning was adopted by a heavy popular majority and in 1928 a statute putting it into effect was enacted.

The Missouri decision, in the highest State court, was sweepingly against zoning as outside the police power and confiscatory, while the Louisiana and Wisconsin decisions, also in the highest State courts, were as unconditionally sweeping in the opposite direction. The Missouri decision, four to three; held that the *St. Louis* zoning ordinance "provides for the taking of property for a public use without compensation and without a judicial hearing," is outside the police power, and would result in "confiscation pure and simple." The *New Orleans* zoning ordinance, sustained by the Louisiana Supreme Court in reversal of a lower court, rests on this authorization of zoning in the Louisiana constitution of 1921: "All municipalities are authorized to zone their territory to create residential, commercial and industrial districts and to prohibit the establishment of places of business in residential districts." The court held that the New Orleans ordinance "is a valid exercise of the police power" and not in violation of the Federal constitution. The Louisiana court even went so far as to declare that aesthetic considerations, as affecting "the comfort and happiness of the residents" of a district and sustaining "in a general way the value of property in a neighborhood," may be protected by a zoning ordinance. It also said: "An eyesore in a neighborhood of residences might be as much of a public nuisance, and as ruinous to property values in the neighborhood generally, as a disagreeable noise, odor, or menace to safety or health."

In the *Milwaukee* decision, given by the State Supreme Court of Wisconsin on Dec. 11, 1923, the court said in part:

If in the prosecution of governmental functions it becomes necessary to take private property, compensation must be made, but incidental damage to property resulting from governmental activities or laws passed in the promotion of the public welfare is not considered a taking of the property for which compensation must be made.

... It cannot be denied that a city systematically developed offers greater attractiveness to the house seeker than a city developed in a haphazard way. The one compares to the other as a well ordered department store compares to a junk shop.

By a unanimous decision of the Kansas State Supreme Court in a *Wichita* case, the validity of excluding a commercial building from a residence district was established. Included in the decision were these sentences: "There is an aesthetic and cultural side of municipal development which may be fostered within reasonable limitations. Such legislation is merely a liberalized application of the general welfare purposes of the State and Federal constitutions." See *National Municipal Review*, June 1923, for synopsis of case and decision.

**Euclid Zoning Decision.** The ruling decision on the constitutionality of zoning was handed down in 1926 by the United States Supreme Court (*Village of Euclid v. Ambler Realty Co.*, 272 U. S. 365; see 1926 *New International*

*Year Book*). It overruled a Federal District Court and upheld a zoning ordinance passed in 1922 by the Village of Euclid, Ohio, a suburb of Cleveland, having a population of about 7500. Despite the fact that the court accepted evidence designed to show that the market value of the tract of land in question for residential purposes, to which it was restricted by the zoning ordinance, was only \$125 per acre, while for the industrial use to which the owner wished to put the land it was worth \$10,000 an acre, the court upheld the ordinance as not against either the constitution of Ohio or Section 1 of the 14th Amendment of the Constitution of the United States. In the course of its opinion, in discussing nuisances, the court held, as applicable to placing business in a residence district: "A nuisance may be merely a right thing in the wrong place—like a pig in the parlor instead of the barnyard. If the validity of the legislative classification for zoning purposes be fairly debatable, the legislative judgment must be allowed to control." (*Radice v. New York*, 264 U. S. 292, 294.) After pointing out that some State courts have reversed their own decisions against zoning, the court reviews, with approval, lower court decisions upholding the exclusion of business buildings from residence districts, in the interest of "the health and safety of the community." The court also states:

The matter of zoning has received much attention at the hands of commissions and experts, and the results of their investigations have been set forth in comprehensive reports. These reports, which bear every evidence of painstaking consideration, concur in the view that the segregation of residential, business, and industrial buildings will make it easier to provide fire apparatus suitable for the character and intensity of the development in each section; that it will increase the safety and security of home life; greatly tend to prevent street accidents, especially to children, by reducing the traffic and resulting confusion in residential sections; decrease noise and other conditions which produce or intensify nervous disorders; preserve a more favorable environment in which to rear children, etc.

In both the United States and Canada, city planning is controlled by several States and provinces, and activities of the general government in that field are confined to advice, research, and the collection and dissemination of information. State activities in America have been confined to legislation except that in a few instances State departments or divisions of city planning have been created, notably in Massachusetts and Pennsylvania. In 1917 Canada, through its Department of Conservation and Development put out a model town-planning act for the benefit of such of the provincial Legislatures as might wish to pass acts dealing with the subject.

In 1919 the British Town Planning Act of 1909 was amended. An important change was a clause making town planning compulsory instead of permissive, the compulsory feature going into effect Jan. 1, 1923, in all places which by the Census of 1921 had a population of 20,000 or more. See *The New International Year Book*, 1919, for further details.

Regional planning received increasing attention since papers on the subject were presented to the National Conference on City Planning at its meeting in 1919 (see *Proceedings* of the Conference). Up to 1924, the subject had not gone beyond the study and report stage. By far the most notable undertaking of this kind, under the name, "Plan of New York and Its Environs," (changed later to "Regional Survey of New

York and Environs") was begun early in 1921 and first publicly announced in May, 1922, at a largely attended meeting of engineers, architects, city planners, publicists, and civic workers held in New York City at the call of the Russell Sage Foundation, the chief backer of the project. The plan included the entire metropolitan district of New York and New Jersey and all of Long Island and took in territory extending 40 miles south and west from the City Hall of New York into New Jersey, 60 miles north up the Hudson River Valley, 55 miles east into Connecticut and the whole of Long Island, taking in Bridgeport, Conn.; West Point, N. Y.; Princeton, N. J., and a large part of the New Jersey seacoast. The regional survey embraces some 5500 square miles with a resident population of some 10,000,000, living in over 400 communities. The work was in charge of a committee having Fred eric A. Delano as chairman, with Thomas Adams as general director of plans and surveys. By 1929 the committee had published several of its proposed Survey volumes and a series of monographs and had under way two Plan volumes.

Los Angeles Regional Planning Conferences were held in 1922 and 1923. The committee on Municipal and Metropolitan Affairs of the Boston Chamber of Commerce made a report in 1922 on *Metropolitan Planning and Development in Boston and Its Environs*. In 1923 there was formed within the Metropolitan District Commission of Massachusetts a Division of Metropolitan Planning to investigate the transportation service and its coordination with roads, bridges, waterways, railroads, street railways, and other arteries of traffic. In January, 1924, a Minneapolis-St. Paul Metropolitan Planning Committee was organized to serve an area 25 miles in radius. This movement had been started by the Northwestern Section of the American Society of Civil Engineers. During 1923 the Regional Planning Association of America was formed, with Clarence S. Stein of New York City as secretary.

Up to the end of February, 1929, a list maintained by the U. S. Department of Commerce included 30 regional-planning commissions, official and unofficial, besides 649 official and 37 unofficial municipal-planning commissions. These ranged from bodies confined to counties to the tri-state organization covering metropolitan New York, Connecticut, and New Jersey, and a second tri-state body centring in Philadelphia to the National Capital Park and Planning Commission at Washington, the studies of which extend into Maryland and Virginia. Notable for accomplishment in cooperation with minor civil divisions has been the Chicago Regional Planning Commission, a voluntary organization. In New York State working under State legislation, the Niagara Frontier Planning Board (Buffalo) and the Onondaga County Regional Planning Board may be mentioned. See *Engineering News-Record*, Oct. 4, and Nov. 22, 1928, pp. 496 and 758 for the first two of a series of articles on regional engineering, by W. W. DeBerard, former chief engineer of the Chicago Regional Planning Commission.

Construction work to carry out city replanning improvements included large expenditures at Chicago for important street widenings and extensions, and also lesser improvements and slowdown the scale to the widening of streets for a block or two in small places at St. Louis, Detroit, Philadelphia, Boston, and elsewhere. Civil

groups at Cleveland, Denver, San Francisco, and smaller places have been developed.

**Civic Centre Projects.** Notable groups of public buildings were to be found in 1929 from coast to coast, only partly executed, as a rule, or else in the planning or at best the site-acquisition state. A simple but impressive group had been completed some years earlier at Springfield, Mass., consisting of a city hall and an auditorium, with a detached tower between them. In the District of Columbia, progress had been made on a revivification of the L'Enfant plan for grouping Federal buildings, adopted over a century ago, Department of Commerce, Internal Revenue, and Archives buildings had been authorized, and five others were projected on a large triangle bounded by Pennsylvania Avenue, Fifteenth and B Streets. The five additional buildings proposed but not authorized were for the Department of Labor, Department of Justice, a General Accounting Office, Independent Establishments and Interstate Commerce Commission. Progress also had been made on a plan for a municipal centre, also bounded on one side by Pennsylvania Avenue; a bill authorizing the District Commissioners to purchase land for the purpose, but carrying no appropriation, was signed by President Coolidge on Mar. 2, 1920.

At Rochester, the outcome of the subject was uncertain early in 1929, while at Buffalo, there was some definite accomplishment. The Cleveland group plan had several buildings completed along a mall leading up from the lake bluff, this being one of the earliest projects. At Cincinnati, a county court house had been built as a part of a group plan along the Central Parkway, a boulevard on the site of an abandoned canal. The City of Duluth dedicated a city hall in November, 1928, near the existing county court house and construction was to start in 1929 on a Federal building. Progress had been made at St. Paul on both a State and a city civic centre, plans for each having been approved by the city-planning board, but neither had been approved by the respective legislative and appropriating bodies, although the bonds had been voted for a city hall and court house and public-safety building, without specification of their sites.

At St. Louis, land had been partly acquired in 1929 for a memorial plaza and civic centre near the city hall; a civil courts building had been completed and steps were being taken for a municipal auditorium and convention hall, to be followed by a memorial building and, it was hoped, by a Federal building. Across from a park in front of the Colorado capitol, the State Office Building and the State Museum, an amphitheatre, Carnegie Library, and Colonnade to Civic Benefactors had been built and the surrounding area landscaped. Still further on, the city had bought land and torn down buildings for a site for city and county buildings, bids for the construction of which had been received. The United States Mint was on the corner of the next block. San Francisco built a city hall on a fire-swept area after the earthquake of 1906 and across the plaza fronting the city hall there stood in 1929 an auditorium and a State building. Several other buildings were projected as a part of this group. Los Angeles completed a large city hall in 1928 on part of a civic-centre site previously approved and set apart by the city and the county authorities. A Federal building on the site was in existence, funds for a State building were available, and a county

Court of Justice building was projected for early construction, to replace an old court house and a hall of records on the civic-centre site which will be torn down and the space they filled left clear. A "great circle" is included in the project, near a small circular plaza which is the original centre of the Pueblo Los Angeles, dating back to 1781.

New cities under construction in 1929, more or less like the "garden cities" of England, included Radburn, N. J., and Westchester, Ill., laid out *de novo* for populations of 25,000 and 98,000, respectively, the first as a self-contained city with business, industries, residences, and parks, the other a purely residential city, with facilities for business to meet local needs only. As a site for Radburn, the City Housing Corporation (New York City), bought 1,000 acres of land in the borough of Fair Lawn, between Paterson on the west and Hackensack on the east, some fifteen miles from New York City. After preliminary engineering studies, ground was broken Aug. 1, 1928. By Mar. 1, 1929, some streets had been provided with water, sewerage, gas, electric-light wires, and paving; 200 one-family houses and a large store and office building were nearly completed and plans had been made for a group of apartment buildings to house 1000 families. Additional housing at the rate of 1000 families a year was proposed. A feature of Radburn was the separation of automobile and pedestrian traffic, short stub-end residence streets extending either way from through-traffic streets, with gardens and walks between the houses, parks, and playgrounds behind them, and a school for each two or three blocks. Walks in the parks and underpasses beneath main vehicular streets enable children to go to school without crossing motor-vehicle routes at grade. The general scheme just outlined, adopted at Radburn and elsewhere, was thus characterized by Jacob L. Crane, Jr., in an article entitled "Turning City Streets Inside Out," in *The American Mercury*, March, 1929:

The specifications call for a large enough area to provide for group play, say at least 100 ft. wide and as long as the block happens to be. There should be no access for automobiles. Woodmar in Indiana, the Country Club District at Kansas City, an outlying development near Dallas and the Radburn project in New Jersey furnish examples. A two-thousand acre Illinois land operation now under development is laid out with interior playgrounds. . . . If we are to have suitable interior parks or playgrounds, we must turn our houses around and front them on open spaces. We could then push our houses back to the service-way which the street has become.

The new city of Westchester, Ill., was located on 2200 acres of undeveloped land, 13 miles west of Chicago. The project was laid out according to an article by one of the designing and constructing engineers (see *Engineering News-Record*, Feb. 21, 1929). Construction work on the first (500-acre) unit of this project was well under way early in 1929, with over \$3,000,000 spent or to be spent for streets, sewers, and street lighting.

**Bibliography.** Among the many books on city planning and allied subjects published since 1913 are Nolen, *City Planning* (New York) and *New Towns for Old* (Boston); Lewis, *The Planning of the Modern City*, followed by new edition in 1922 (New York); Adams, *Rural Planning and Development* (Ottawa, Canada); *Garden Cities and Back to the Land* (London); Moore, *Daniel Burnham, Planner of Cities* (Boston); Williams, *The Law of City Planning and Zoning*, on world-wide legislation and American

court decisions (New York); Baker, *Legal Aspects of Zoning* (Chicago); James, *Land Planning in the United States for the City, State and Nation* (New York); Kimball, *Manual of Information on City Planning and Zoning* (Cambridge, Mass.); Hughes and Lanbourn, *Towns and Town Planning, Ancient and Modern* (London); Adshead, *Town Planning and Town Development* (London); Wier (editor) *Parks: A Manual of Municipal and County Parks* (New York). Consult also annual reports of *National City Planning Conference* (New York); *City Planning*, a quarterly (Boston) in which once a year is an annual survey; and *Town Planning Review*, a British quarterly. For more details regarding many of the projects and doings mentioned in this article, see issues of the *New International Year Book*.

to deal with social and industrial problems. Aside from the work carried on throughout the year by the executives and various committees, the Federation assembles annually to arrange its programmes, and to take its stand upon current public matters. At the 1924 meeting held in New York City, April 23-24, the department on current economic and political movements reported on industrial, social, and civic progress in the past fifty years. The discussion embraced the new economic policy of the American Federation of Labor, Soviet Russia, pacifism and militarism, and practical politics. A department of industrial relations was created on Dec. 30, 1924, in memory of August Belmont and Samuel Gompers, to alleviate the difficulties between employer and employees. In 1925 the New York Industrial Round Table convened

**CITY MANAGER.** See MUNICIPAL GOVERNMENT.

**CIVIC CENTRES.** See CITY AND REGIONAL PLANNING.

**CIVIC FEDERATION, THE NATIONAL.** An American educational society, organized in 1900,

twice, once to discuss the possibility of eliminating industrial waste and controversy, and again to compare competitive and regulated industries. The department of subversive movements continued its opposition to Russian communistic activities in the United States.

The department of current economic movements devoted the year to a study of the effects of the Sherman Law. After a prolonged study of old-age pensions in the United States and other countries, the industrial welfare department issued, in 1925, the *Proposal upon Old Age Annuities*.

In 1926 the Round Tables discussed the problems of the coal industry in the United States, and the practicability of compulsory arbitration.

The department of political education completed, Nov 1, 1926, the campaign of the previous year, to rouse general interest in voting, and in other party activities. The industrial relations department advocated trade agreement in organized industry. In 1927 the movement to enlist the public in political affairs was continued under the department of active citizenship. According to the recommendations of the department of industrial relations, a commission was appointed to study: The Sherman Anti-Trust Act; government by injunction; the "yellow dog" contract; and the company union. In April, 1927, the department of industrial welfare published a second report on old-age pensions. In cooperation with the woman's department, it made a survey of the housing conditions in army posts. The woman's department also made a survey of illiteracy among adults, and investigated almshouses in New York, Pennsylvania, New Jersey, and Connecticut. The National Civic Federation sent various commissions to Europe in 1927 to study foreign social and industrial conditions.

In 1928 the work of the Federation continued along the lines instituted in the previous year. The efforts of the department of active citizenship were endorsed by both presidential candidates, and the interest in the election was unprecedented. In 1929 Elihu Root was honorary president of the organization, and Matthew Woll acting president. Headquarters were at the Metropolitan Tower, New York City.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** An organization founded in 1881, to establish and promote the merit system of appointment, promotion, and removal of government officials throughout the United States. The League has continued its activity in investigating conditions in the Government, in protesting against violations of the law, and urging the extension of the merit system. As a result of its findings on the source of inefficiency in government departments during the War, President Wilson reorganized the Civil Service Commission in 1919. Clauses inimical to civil-service reform were struck out from the National Defense Bill, the Shipping and Defense Bills of 1916, and the 1920 Census Bill, although the Rural Credits Bill and the Volstead Bill were enacted without changes suggested by the League. A bill sponsored by the League which provided for the reorganization of the Foreign Service was enacted, a successful campaign was conducted in Colorado in cooperation with the local committee for a civil-service amendment to the constitution, and civil-service charters were secured with its aid in several important cities throughout the Nation. Under the Harding administration, the League protested the dismissal of the director and 30 employees of the Bureau of Engraving and Printing and the dismissal of A. P. Davis from the office of Commissioner of Reclamation. During 1928 the League sponsored legislation placing postmasters of the first,

second, and third classes in the competitive civil service, and urged legislation empowering the President to place in the competitive classified service all Federal positions then exempt by statute. It also urged the adoption of the recommendation of the Joint Congressional Committee to include in the competitive service all field positions in the Internal Revenue Service, and reported to Congress the need for the extension of the Civil Service Act to the District of Columbia service. The League was successful in 1928 in its campaign against the proposal made in Congress to include in the competitive service, without examination, the old prohibition agents, and succeeded in its efforts to have such positions filled after competitive examination. *Good Government* is the official organ of the League and the president in 1928 was George McAneny. Headquarters are at 8 West 40th Street, New York.

**CLAIR, MATTHEW WESLEY** (1865- ). A bishop of the Methodist Episcopal Church born at Union, W. Va., and educated at Morgan College, Baltimore. He was ordained to the ministry of the Methodist Episcopal Church in 1889, and held various charges in West Virginia and in the District of Columbia until 1919, when he became district superintendent in Washington. In 1920 he was made bishop and assigned to Monrovia, Liberia.

**CLAIRE, INA (FAGAN)** (1892- ). An actress and vocalist born at Washington, D. C., who opened her career by impersonations of Harry Lauder in vaudeville entertainment in 1907. She has spent her time between plays and vaudeville and is best known for her talent of mimicry. Some of her best parts included: Polly Shannon in *Polly with a Past* (1917); Jerry Lamar in *The Gold Diggers* (1919); and the wife in *Bluebeard's Eighth Wife*. She also starred in *The Awful Truth* (1923), *Grounds for Divorce* (1924), and *The Last of Mrs. Cheyney* (1925).

**CLAPP, CHARLES HORACE** (1883- ). An American geologist and university president, born at Boston, Mass. He was graduated in 1905 at the Massachusetts Institute of Technology, where in 1910 he received the Ph.D. degree. In 1905 he became instructor of geology at the University of North Dakota, and at the same time, assistant geologist of the State Survey. Two years later, he returned to the Institute of Technology. During 1908-15, he was geologist on the Geological Survey of Canada, and then for three years was professor of geology at the University of Arizona. He was called in 1916 to the chair of geology at the Montana School of Mines; in 1918 he became president of the School of Mines and in 1921, president of the State University of Montana. He was also director of the Montana Bureau of Mines, 1919-22, and assistant geologist of the United States Geological Survey 1914-25. His original investigations have to do with petrology and economic geology, on which subjects he has published many papers and reports.

**CLAPP, EDWIN JONES** (1881- ). An American economist, born at Hudson, Wis., and educated at Yale University and at the University of Berlin, Germany. During the period 1910-12, he taught economics at Yale and at New York University. From 1914 to 1920, he was professor of economics in New York University, and afterward was privately engaged in the study of economic problems. He wrote:

*The Navigable Rhine* (1911); *The Port of Hamburg* (1911); *Economic Aspects of the War* (1915); *The Port of Boston* (1916); *Railway Traffic* (1917); *The Port of Charleston* (1921), and *The Port of Baltimore* (1921). He was financial editor of the *New York American*, 1922-23, and editor, 1924. Later he served as staff correspondent and financial writer for the *Hearst newspapers*.

**CLARK, ALBERT CURTIS** (1859- ). An English classical scholar (see VOL. V). He became professor of Latin at Oxford University in 1913. His later works include *The Primitive Text of the Gospels and Acts* (1914); *Recent Developments in Textual Criticism* (1914); *The Descent of Manuscripts* (1918); *The Reappearance of the Text of the Classics* (1921).

**CLARK, BARRETT H (ARPER)** (1890- ). An author and editor born in Toronto, Canada. He is best known for his many books on the theatre, including *The Continental Drama of To-day* (1914); *British and American Drama of To-day* (1915); *Contemporary French Dramatists* (1915); *How to Produce Amateur Plays* (1917-25); *A Study of the Modern Drama* (1925); *Eugene O'Neill* (1926); *Oedipus or Pollyanna* (1927). He was editor of *The World's Best Plays* series, 58 vols. (1915-26); four titles in the Drama League's series (1914-18); Walter Pritchard Eaton's *Plays and Players* (1916); *Representative One-act Plays by British and Irish Authors* (1921); *Appleton Play-Book* (1926), and *Great Short Novels of the World* (1927). He is co-author of *The Rivet in Grandfather's Neck* (1921) and edited and translated many foreign plays. He was dramatic director of Camp Humphreys in the World War.

**CLARK, CHAMP** (1850-1921). An American politician (see VOL. V). From 1919 until his death, he was Democratic minority leader in the United States House of Representatives, having been Speaker in the House previous to that date. He was defeated in the election of 1920. He died in Washington, D. C., on Mar. 2, 1921.

**CLARK, CHARLES EDWARD** (1889- ). An American law teacher. He was graduated at Yale College in 1911 and at the Yale School of Law, *summa cum laude*, in 1913, and practiced at New Haven for six years. He was a member of the Connecticut Legislature in 1917 and became assistant professor of law in the Yale Law School (1919-22), associate professor (1922-23), and professor after 1923 (Lines Professor, 1927-29, and Starling Professor, 1929- ). In 1929 he was made dean of the Yale Law School. He is co-author of *Probate Law and Practice in Connecticut* (1915), and author of *Code Pleading* (1928), and *Real Covenants* (1929).

**CLARK, CLARENCE DON** (1851- ). An American senator (see VOL. V). He was appointed member of the International Joint Commission in 1919 and became chairman of the United States section.

**CLARK, GEORGE LUTHER** (1877- ). An American lawyer, born at Waynesville, Ohio. He graduated from Kenyon College in 1896, and studied law at Indiana University and at Harvard. From 1902 to 1904, he was instructor in law at Leland Stanford, Junior, University, and from 1904 to 1909 was professor of law at the University of Illinois. He held a like position at the University of Michigan from 1909 to 1912, at the University of Missouri from 1913 to 1921, at the University of Cincinnati, 1924-25, and at New York University after

1925. He is author of *Equity* (1919); and *Selected Cases on Equity* (1921).

**CLARK, JAMES TRUMAN** (1852-1922). An American railway official, born in Albany, N. Y. He was educated in the public schools of that city and began his railway service as messenger boy with the New York Central Railroad in 1870. In 1873 he joined the Chicago and Northwestern Railroad and was rapidly promoted to important positions with that line, becoming vice president in charge of traffic in 1899. From 1916 to 1922, he was president of the C. St. P. M. & O. Railway.

**CLARK, JOHN BATES** (1847- ). An American economist (see VOL. V). He retired from his Columbia professorship and from his post as director of the division of economics and history in the Carnegie Endowment for International Peace in 1923. In 1928 a volume of economic essays in honor of Professor Clark was published by his colleagues, friends, and former students.

**CLARK, JOHN MURRAY** (1860- ). A Canadian lawyer and scholar. He was educated at the University of Toronto. At one time, he was president of the Royal Canadian Institute, the most important learned society of the Dominion. He was appointed by the government to codify the mining laws of Canada. Among his publications are *The Law of Mines in Canada*; *Company Law*; *International Arbitration*; *The Future of Canada*; *Proportional Representation*; *Thermotics, Canada and the Navy*; *The Reign of Law*; *Canada's Gold and War Finance*; *Disallowance*; *The Virginia Experiment*; *Canada and Virginia*; *The Gold Standard and the Pre-Cambrian*; and *Geneva*.

**CLARK, J (OSHUA) REUBEN JR.** (1871- ). An American lawyer and diplomat. Born and reared in Utah, he studied at the Latter Day Saints' College, Salt Lake City, and at the University of Utah. After several years of teaching in his native State, he went to New York, where he was admitted to the bar and obtained the LL.B. degree from Columbia University. He was assistant solicitor of the State Department at Washington in 1906-10 and solicitor, 1910-13. He served as general counsel for the United States before the American British Claims Commission in 1913 and as counsel for the State Department and expert assistant to the American commissioners at the Conference on Limitation of Armaments in 1921. In 1927 he was retained by Ambassador Dwight W. Morrow as special counsel in negotiating a settlement of issues between the United States and Mexico. He was appointed Under Secretary of State in 1928 and at once gave particular attention to Latin-American affairs. In the Taft administration, under the direction of Secretary Knox, he prepared a memorandum, *The Right of the United States to Protect Its Citizens in Foreign Countries by Landing Forces*.

**CLARK, L (EON) PIERCE** (1870- ). An American neurologist and psychiatrist and a leading authority on epilepsy. Born at Ingle-side, N. Y., he received his medical degree from New York University in 1892 and became resident physician of the Craig Colony for Epileptics. After serving many years in this capacity, he settled in New York as a neurologist. In connection with the treatment of epilepsy he has of late years advocated psychotherapeutic measures as valuable and has made converts to

this view in this country and Great Britain. He has written assiduously on the subject of epilepsy for nearly 30 years. In 1926 he founded the *Archives for Psychoanalysis*.

**CLARK, SIR WILLIAM (HENBY)** (1876- ). A British public official, appointed High Commissioner in Canada in 1928. He was educated at Eton, Trinity College, and Cambridge University and after some years in the diplomatic service became private secretary successively to Lloyd George, Winston Churchill, and other public figures. In 1916-17 he was controller general of commercial intelligence in the Department of Board of Trade, and in 1917-28 controller general of the Department of Overseas Trade. He was knighted in 1915.

**CLARK, WILLIAM MANSFIELD** (1884- ). An American physiological chemist. He was born at Tivoli, N. Y., graduated at Williams College in 1907, and received the degree of Ph.D. at Johns Hopkins in 1910. He was research chemist in the dairy division of the U. S. Department of Agriculture, 1910-20, and professor of chemistry in the Hygienic Laboratory of the U. S. Public Health Service, 1920-27. After 1927 he was De Lamar professor of physiological chemistry at Johns Hopkins. In 1928 he was elected to the National Academy of Sciences. He is the author of *The Determination of Hydrogen Ions* (1920).

**CLARKE, SIR EDWARD GEORGE** (1841- ). An English lawyer (see VOL. V). He retired from the bar in 1914. His later works include: *The Book of Psalms: the Prayer Book Version Corrected* (1915); *The National Church* (1916); *The Story of My Life* (1918); and *Benjamin Disraeli: The Romance of a Great Career* (1926).

**CLARKE, JOHN HESSIN** (1857- ). An American jurist, born at Lisbon, Ohio. He graduated from Western Reserve University in 1877, and in the following year was admitted to the Ohio bar. From 1878 to 1880, he practiced at Lisbon, and after 1880 at Youngstown. He moved to Cleveland in 1897 where he remained until 1914. For many years he was general counsel of the New York Central and the St. Louis railroads. He served as United States district judge for the Northern District of Ohio from 1914 to 1916, and in the latter year was appointed associate justice of the Supreme Court of the United States. He resigned in 1923 in order to devote all his time to the interests of the League of Nations, of which he was an ardent supporter.

**CLARKE, JOHN MASON** (1857-1925). An American geologist and paleontologist (see VOL. V). He was president of the Geological Society of America in 1916-17. His works include: *Organic Dependence and Disease* (1921); *James Hall of Albany* (1922); *L'Île Percée* (1923).

**CLARKSON COLLEGE OF TECHNOLOGY.** A college for men founded in 1896 at Potsdam, N. Y. The number of students increased from 104 in 1914 to 375 in the autumn of 1928 and the number of faculty members from 10 to 24; productive funds totaled \$700,000. In that year also the college received as a gift an estate of 625 acres which was the ancestral home of the Clarkson family. The moving of the institution to this site—Clarkson Hill—is contingent upon the receipt of additional funds for the purpose. Joseph Eugene Rowe, Ph.D., succeeded John P. Brooks, Sc.D., as president in 1928.

**CLARK UNIVERSITY.** A non-sectarian institution, comprising a college for men and a coeducational graduate division of arts and sciences, at Worcester, Mass., founded in 1889. The enrollment in the autumn of 1928 was 481, distributed as follows: Undergraduates, 235; graduate students, 65 (as compared with 94 in 1914); special students, 16; and extension students, 165; and in addition, there was a summer-session enrollment of 224. Between 1914 and 1928, the number of members in the faculty was increased from 21 to 40; the library was increased from 60,000 to 105,000 volumes; and the productive funds from \$2,400,000 to \$5,000,000. A graduate school of geography was established in 1921; a department of geology was added in 1922; special emphasis was given in 1923 and 1924 to studies in history, international relations, economics, and geography; and the publication of two new quarterly journals, the *Journal of Economic Geography*, and *Genetic Psychology* (*Monographs*) was begun in 1925. President, Wallace W. Atwood, Ph.D.

**CLASSICAL PHILOLOGY.** See PHILOLGY, CLASSICAL.

**CLAUDEL, klôd'-êl', PAUL** (1868- ). A French diplomat, poet, dramatist, and member of the French Institute, who was born in Champagne at Villeneuve-sur-Fère, and educated in Paris. He frequented the Symbolist circles, attending Mallarmé's famous Tuesdays. Later, he entered the French consular service and was sent successively to the United States, China, Czechoslovakia, and Germany. During the World War, he was transferred to the diplomatic service, acting first as Minister to Brazil (1916) and Denmark (1919), and then as Ambassador to Japan (1921-26) and to the United States (1927- ). After his conversion to Catholicism at 20, he became a poet of mysticism, and broke with the French classical tradition of analytic clarity. He excelled in giving an impression of ensembles and was best known for his dramatic poems. He had a literary vogue both before and after the War, when *L'annonce faite à Marie* (1911) was played in Paris. Claudel's works include: *Vers d'Exil* (1895); *La Connaissance de l'Est* (1900); *L'Arbre* (1900-01); *L'Otage*; *Cette Heure qui est entre le printemps et l'été*; *Art poétique* (1907); *L'Echange*; *Le Partage de Midi*; *La Tête d'or*; *Le Repos du septième jour*; *La jeune fille Violaine*; *La Ville*; *La Connaissance du monde*; *Cinq grandes Odes* (1910); *Le Pain dur*; *La Nuit de Noël* (1914); *Corona benigatilis*; *Poèmes d'été* (1914); *Poèmes de guerre*; *L'Ours et la lune* (1919); *Le père humilié* (1920); *Feuilles de Saints*; *Les Euménides d'Eschylle*; *Proteus* (1922); *L'oiseau noir dans le soleil levant*, social life in Japan, illustrated by Foujita (1927), and *Positions et Propositions* (1928). Quite a number of these works have been translated into English.

**CLAUSSEN, JULIA** (1879- ). A famous Swedish dramatic mezzo-soprano, born in Stockholm. After studying in her native city, Berlin, and Bayreuth, she made her début at the Royal Opera in Stockholm in 1903. During 1912-17 she was one of the principals of the Chicago Opera Company, appearing also as guest in London and Paris. Since 1917 she has been a member of the Metropolitan Opera Company. The extraordinary range of her voice (F-c2) enables her to sing with equal facility

high soprano rôles (Brünnhilde, Kundry, Aida) and low contralto rôles (Fides, Dalila).

- **CLAXTON, PHILANDER PRIESTLEY** (1862- ). An American educator (see Vol. V). He resigned as United States Commissioner of Education in 1921, becoming provost of the University of Alabama, 1921-23, and superintendent of schools at Tulsa, Okla., in 1923. He is also known as a member of several peace societies.

**CLAYTON, HENRY DE LAMAR** (1857- ). An American jurist. He was born in Barbour County, Ala., and graduated from the University of Alabama in 1877, and from the law department of the university in 1878. From 1893 to 1896, he was United States District Attorney, and in 1897 was elected to the 55th Congress, serving until May, 1914, when he was appointed district judge for the Middle and Northern Districts of Alabama. While in Congress, he was the author of the Clayton Act for the regulation of railways and was chairman of the Judiciary Committee in the 62d and 63d Congresses. In 1908, he served as permanent chairman at the Democratic National Convention.

**CLAYTON ANTI-TRUST ACT.** See TRUSTS.

**CLEARING HOUSES.** See FINANCE AND BANKING.

**CLEARWATER, ALPHONSO TRUMBOUR** (1848- ). An American jurist. He was born at West Point, N. Y., and was educated in public and private schools. In 1871 he was admitted to the bar and was elected district attorney of Ulster County in 1877, being re-elected several times. He was appointed justice of the Supreme Court to succeed Alton B. Parker, chosen chief judge of the Court of Appeals. He held many important positions both in legal and civil life, and was many times a delegate to national, State, and other conventions. He is the author of numerous papers and addresses on historical, patriotic, and biographical subjects, and served on many important legal commissions. He supervised the translation of the Dutch records of Ulster County, 1895-98. In 1925 he served as a commissioner on the consolidation of State departments. He is known as a collector of early American silver.

**CLEMEN, klēm'-ən. OTTO CONSTANTIN** (1871- ). A German theological historian born in Grimma. He studied theology and history, specializing on the Reformation. His principal works are *Johann Pupper von Goch* (1896); *Georg Helts, Briefwechsel* (1907); *Alcaian Chrosner* (1908); *Studien zu Melanchthons Reden und Gedichten* (1913); *Alle Einblatt-drucke* (1911); *Beiträge zu deutschen Kultur-geschichte aus Milau, Riga und Reval* (1919). Clemén is the editor of many pamphlets on the Reformation and the works of Luther.

**CLEMEN, PAUL** (1866- ). A German writer born at Sommerfeld. He studied philosophy and history, and later became professor of art history at Bonn and director of the art galleries of the Rhine provinces. In 1907-08 he was exchange professor at Harvard. He has written among other works: *Die Portraitdarstellung Karls des Grossen* (1889); *Der karolingische Kaiserpalast zu Ingelheim* (1890); *Merovinger und Karolinger Plastik* (1892); *Die Kunstdenkmäler der Rheinprovinzen* (1892); *Ruskin* (1900); *Die romanische Monumental-*

*malerei in den Rheinlanden* (1910); *Denkmalpflege in Frankreich* (1918); *Kunstschutz im Kriege* (1919); and *Belgische Kunstdenkmäler* (1921).

**CLÉMENTEAU, klá'man'só', GEORGES EUGÈNE BENJAMIN** (1841- ). A French statesman (see Vol. V), who had written and spoken about the possibility of war long before the World War began, urging the realization of the artillery programme. In September, 1914, his paper, *L'Homme Libre*, was suppressed on account of its violent criticism of the army medical services. Two days later, he issued *L'Homme Enchaîné*, in which he fought the policy of the Government. He also attacked them in the Senate. On the outbreak of War, he was president of the Foreign Affairs Committee, and later became president of the Army Committee of the Upper Chamber. His policy was directly opposed to M. Caillaux's (q.v.), as he advocated fighting to the finish. On Nov. 16, 1917, he succeeded M. Painlevé as Prime Minister, and formed his "Victory Cabinet," thus defeating the efforts of M. Caillaux. While he was in power during the War, his policy was drastic in regard both to the conduct of the War and to food restriction. This policy was accepted without opposition as long as the War lasted, but after the Armistice, his countrymen showed less confidence in him as a leader in peace-time. Attempts were made to drive him from office before the peace negotiations, but he remained in power until after the Peace Treaty was signed, presiding over the Peace Conference, as France's chief delegate. On Feb. 19, 1919, he was fired upon and wounded by a young anarchist, Émile Cottin. He was proposed as candidate of his party for the Presidency in 1920, but withdrew his name when he saw that he stood little chance of success against M. Deschanel. He then retired from politics, traveled in the Orient in that year and visited the United States in 1922. He became a member of the French Academy in 1918, and was given the doctor's degree at Oxford in 1921. *Démophilènes* (1926) and *American Reconstruction* (1928) were two of his late works. Consult *Clémenteau, sa vie—son œuvre*, by G. Gefroy and Lunet (1920).

**CLEMENT, ERNEST WILSON** (1860- ). An American teacher in Japan and writer on Japanese subjects (see Vol. V). He was vice president of the Asiatic Society of Japan from 1916 to 1921. In 1920 he resigned as special correspondent of the *Chicago Daily News*. His recent works include: *A Short History of Japan* (1915), *Constitutional Imperialism in Japan* (1916), and *Fifty Sessions of the Japanese Imperial Diet* (1925).

**CLEVELAND.** Fifth city in size in the United States. The population rose from 569,342 in 1910 to 796,841 in 1920, and to 1,010,300 in 1928, by estimate of the Bureau of the Census. The area of the city has increased from 51.83 square miles in 1914 to 70.67 square miles in 1928. Cleveland is the largest city in the United States operating under the city-manager plan of government. The necessary charter amendment was passed in November, 1921, and the plan went into effect in January, 1924. The Council consists of 25 members, who are elected in groups of five, six, seven, and seven from four large districts by proportional representation. The proposal to return to the federal form has been submitted to the voters several

times but defeated each time, although by not a very large majority. Among the important municipal building enterprises which Cleveland has undertaken in recent years have been the construction of the first units of the Union Terminal group, the erection of additional buildings on the Mall, and the development of the Western Reserve Medical Centre. The Terminal group will be a city within a city, and the cost of the entire enterprise will be approximately \$200,000,000. The Terminal Tower, 52 stories in height, will be the focal point of the group, which will include the enlarged Cleveland Hotel, a 12-story office building, a large department store, the 18-story Medical Arts Building, and the 18-story Builders Exchange Building. The entire project will occupy about 35 acres.

The Mall group, in the heart of the downtown section, is nearing completion as the result of favorable action on the part of voters on recent bond issues. Already constructed are the City Hall, the County Court House, the Public Auditorium, the Federal Building, Main Library, Plain Dealer Building, and Federal Reserve Bank Building. Wings to the large Auditorium provide a dozen smaller halls, one of which is an experimental theatre. A \$2,000,000 school headquarters building and a \$2,500,000 stadium are under construction.

The Western Reserve Medical Centre will consist of the following: Lakeside Hospital (\$3,600,000); Nurses' Dormitory (\$1,600,000); Rainbow Hospital (\$600,000); Western Reserve University Medical School (\$2,250,000); Western Reserve University Nursing School (\$750,000); Babies' and Children's Hospital (\$1,125,000); Maternity Hospital (\$1,500,000); Allen Memorial Library (\$600,000); Pathological Institute (\$750,000); and the Private Pavilion (\$800,000). Funds for the erection of the entire group have been provided by public subscription; and the Rainbow, Babies' and Children's, and Maternity hospitals, the Medical School, and the Library have already been constructed. The Medical Centre is part of a great educational and cultural development, the plans for which include Western Reserve University, Case School of Applied Science, the Cleveland Museum of Art, the School of Education, and several churches. See WESTERN RESERVE UNIVERSITY and CASE SCHOOL OF APPLIED SCIENCE.

Public utilities are being rapidly expanded. Chief of these, as the result of an \$8,000,000 bond issue approved in 1927, is the simplification of the communication over the Cuyahoga River Valley between the eastern and western sections of the city. About \$1,000,000 will be used for the purchase of land at the bridge approaches and \$7,000,000 for the structure itself. More than \$1,250,000 has been spent in purchasing and developing a municipal airport, located nine miles from the heart of the city. More than 1000 acres have been acquired, and nine hangars have been built. This airport is a division point for the New York-Chicago line and is considered one of the best in the United States.

As the result of a Federal road survey, Cleveland is spending approximately \$1,000,000 annually for the building of new streets and the extension and widening of existing ones. The development of its lake front is also under way. Plans call for filling in where needed, between Gordon Park on the east and Edgewater Park on the west, a distance of about six miles. Provision also has been made for extensive ware-

houses and wharf facilities, as well as an air field where planes may stop to take on or unload passengers, thus bringing that service within a few minutes from the downtown section. Another outstanding development is the metropolitan park system. More than 10,000 acres, located roughly on a 90-mile half-circle and consisting of nine units or reservations from 100 to 1000 acres in size, have been acquired.

The assessed valuation of property in Cleveland in 1927 was \$2,092,159,190; the tax revenue was \$20,036,305; and the bonded indebtedness is \$135,506,750. Cleveland has 1105 miles of streets, 934 of which are paved; 1000 miles of gas mains; 1050 miles of sewers; 2240 miles of water mains; and 418 miles of street railway. According to the U. S. Census of Manufactures for 1927, 2416 industries are established in Cleveland and Cuyahoga County, employing an average of 142,450 workers who are paid \$217,143,945 annually. Their output of finished products for 1927 was valued at \$1,121,102,411. Cleveland has 22 banks whose clearings in 1928 amounted to \$6,913,067,000; it is also the home of the Federal Reserve Bank of the fourth district.

Cleveland's Public Library, which was recently completed at a cost of \$4,500,000, is the centre of an extensive library system through which, in 1927, the circulation of books for home use amounted to 7,725,742. The public schools number 168, with an enrollment of 145,661 pupils and 4562 teachers; the parochial schools number 123, with an enrollment of 46,946 pupils and 1092 teachers. There are also five private schools and ten degree-conferring institutions.

**CLEVELAND, FREDERICK ALBERT** (1865- ). An American economist, born at Sterling, Ill., and educated at DePauw University and at the universities of Chicago and Pennsylvania. In 1900-03 he taught finance in Philadelphia and New York City. Thereafter he served on many boards and commissions dealing with economics, and notably, since 1907, on the bureaus of municipal research in New York and Philadelphia. He has held the chair of United States citizenship, Maxwell Foundation, Boston University, since 1919. His works include: *The Growth of Democracy in the United States* (1898); *Funds and their Uses* (1902); *The Bank and the Treasury* (1903); *Chapters in Municipal Administration and Accounting* (1909); *Railroad Promotion and Capitalization* (1912); *A Handbook of Municipal Accounting* (1913); *Organized Democracy* (1913); and *American Citizenship* (1927). He also collaborated on the following works: *Railroad Finance* (with F. W. Powell, 1913); *Democracy in Reconstruction* (with Joseph Schafer, 1919); *The Budget and Responsible Government* (with A. E. Buck, 1920); *National Expenditures and Public Economy* (addresses and papers; with S. M. Lindsay, 1921).

**CLEVINGER, GALEN HOWELL** (1877- ). An American metallurgist, born at Pike, N. Y. He was graduated at the South Dakota School of Mines in 1901. During 1901-05 he served professionally as a chemist and metallurgist to various mining companies, and then spent a year as instructor in metallurgy at Stanford, where, after three years in consulting practice, he returned and held professorial relations with that university until 1918, when he again resumed his consulting practice. During the World War, he was chairman of the section on metallurgy of the National Research Council,

and later became vice chairman of the Division of Engineering on the Council. He has invented various processes for the treatment of ores and is an accepted authority on gold extraction and on manganese-silver ores, as well as on electric smelting.

**CLIFFORD, SIR HUGH (CHARLES)** (1866- ). A British colonial administrator (see VOL. V). He was in charge of the administration of the British sphere of occupation in Togoland during and immediately after the World War, and was governor of the Gold Coast until 1919, when he became governor and commander-in-chief of Nigeria. He was governor of Ceylon from 1925 to 1927, and then became governor of the Straits Settlements and High Commissioner for the Malay States. He was created Knight of the Grand Cross of St. Michael and St. George in 1921. His writings during this period include: *The Further Side of Silence* (1916); *The German Colonies* (1918); *The Gold Coast Regiment in the East African Campaign* (1920); *A Prince of Malaya* (1926); *In Days that are Dead* (1927); and *Some Reflections on the Ceylon Land Question* (1927). He translated the Malay penal code and is joint author of a *Dictionary of the Malay Language*.

**CLIFFORD, LUCY JANE (MRS. WILLIAM KINGDON)** (?-1929). An English author (see VOL. V). She wrote the novels: *The House in Marylebone* (1917); *Mr. Webster and Others* (1918); *Miss Fingal* (1919); and the plays: *A Woman Alone* (1915), *Two's Company* (1915), and *Eve's Lover* (1927).

**CLIMATE.** See METEOROLOGY.

**CLOCK MOTOR.** See ELECTRIC MOTORS IN INDUSTRY.

**CLYNES, THE RT. HON. JOHN ROBERT** (1869- ). A British labor leader, born at Oldham, Lancashire, England. As a child, he worked in a cotton mill. He became a trade-union organizer, and was elected president of the National Union of General and Municipal Workers. He entered Parliament in 1906. He was Parliamentary Secretary to the Minister of Food (1917-18), Food Controller (1918-19), and chairman of the Parliamentary Labor Party (1921-22). He was a moderate of the trade-union side of the British Labor movement, and in 1924 was Lord Privy Seal and deputy leader of the House of Commons in Ramsay MacDonald's Labor cabinet. Later, he became deputy leader and deputy chairman of the Parliamentary Labor Party, a member of the National Executive Labor Party, and in 1929 Secretary of State for Home Affairs in the second Labor Cabinet. He received the honorary degree of D.C.L. from Oxford and Durham universities.

**COAL.** The coal industry throughout the world underwent many significant changes because of the World War and resultant political and economic conditions. As a prime essential to modern industry, coal was naturally important in the War; it was required on an extraordinary scale for the production of munitions. Some of the combatant nations were cut off from their ordinary sources of commercial supply and did not contain this essential within their boundaries.

In this period, the United States, which previously had become preëminent as a producer of coal, maintained its lead and increased its output. In Great Britain, no increase was effected in production. In France, destruction of the mines by the Germans resulted in a short-

age which was in no way met by the amount of coal actually turned over under the terms of the Armistice. Germany's loss of the mines of Alsace and Silesia, and temporarily of those in the Saar Basin and the Palatinate, naturally cut down production; in 1913 Germany exported more coal than it imported, but in 1922 the imports were in excess of the exports.

**Production in the United States.** The accompanying table showing world production and the percentage produced by the United States gives some idea of the relative increase in domestic production during the War and the subsequent return to the pre-war production status. The high percentage in 1926 was the result of the British strike.

When the United States entered the War, the industry was organized under government supervision to secure a maximum output and to stabilize prices. The coal committee of the National Council of Defense fixed a price in 1917; this was later repudiated by its chairman, Secretary of War Baker. After further consideration of the matter, on Aug. 21, 1917, President Wilson fixed a base price for coal, and on August 26, Dr. Harry A. Garfield was appointed fuel administrator. Notwithstanding a decline in the number of miners through military service, coal production picked up in 1918 and more than enough to meet the needs of the country was produced.

#### ANNUAL COAL PRODUCTION OF THE UNITED STATES

	(Net tons)		
	Anthracite	Bituminous	Total
1913	91,525,000	478,435,000	569,960,000
1914	90,321,000	422,704,000	513,525,000
1915	88,895,000	422,624,000	511,819,000
1916	87,578,000	502,282,000	589,860,000
1917	99,612,000	551,790,000	651,402,000
1918	98,826,000	579,386,000	678,212,000
1919	88,100,000	465,860,000	553,960,000
1920	89,598,249	563,490,845	653,089,094
1921	90,473,451	415,921,950	506,395,401
1922	54,683,022	407,894,000	462,577,022
1923	93,339,009	564,156,917	657,495,921
1924	87,926,862	483,686,538	571,613,406
1925	61,817,149	520,052,741	581,869,890
1926	84,437,452	578,290,000	662,727,000
1927	80,096,000	517,763,000	597,859,000
1928	76,734,000	492,755,000	569,489,000

The soft-coal region was the scene of a serious strike in 1919, when the miners demanded the permanent continuance of war-time wages; it was officially terminated December 10. The industry became increasingly efficient in 1920, with the aim of making good the shortages caused by the strike of the previous year; this was achieved in the face of a railway strike and failure to allot and handle railway cars properly. In 1922 conditions were very bad, with serious strikes in both the anthracite and bituminous fields.

During this period, there was increased cost of coal, and this resulted both in greater conservation and improved furnace equipment and operation, as well as the substitution of other fuels, such as crude oil, which could be operated more efficiently. The bituminous strike in 1922 paralyzed the union coal fields, but on the other hand, the non-union fields were able to produce as much as 5,000,000 tons a week, which could have been increased to possibly 6,000,000 or

even 7,500,000 tons in case of a national emergency. Various attempts were made to end this strike and conferences were called by the President of the United States, but without result. It was finally concluded with a victory for the United Mine Workers of America which forced the continuance all winter of the war-time wages.

Decreased production of both anthracite and bituminous coal featured the domestic industry in 1924. Prices in general were somewhat lower than in 1923. No car shortage prevailed and no important labor troubles developed. Despite the general industrial prosperity of 1925, the coal industry remained in a depression. Only the great anthracite strike which began on Sept. 1, 1925, and lasted until February of 1926 saved the bituminous producers from a more severe setback. Labor conditions in the bituminous

but as indicated in the preceding table production showed a marked decline.

**Mine Fatalities.** The mining of coal continued as a hazardous occupation in the United States. The total number of fatalities was lowest in 1922 of any year since the beginning of the War. Since 1922 the number of fatalities has been larger, in more or less direct connection with the increased production since that year. In 1928 one gas-explosion in an anthracite mine caused the death of ten men; and thirteen major explosions in bituminous mines resulted in the loss of 316 lives. The use of "permissible" explosives in increasing quantities is looked forward to as one of the best methods of decreasing coal-mine fatalities. The following statistics from the U. S. Bureau of Mines show the number of accidents in this field during recent years.

FATALITIES AT COAL MINES											
1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927	1928
2,696	2,580	2,317	2,271	1,987	1,971	2,458	2,396	2,230	2,510	2,224	2,200 *

\* In part estimated.

fields were satisfactory, as the signing of a long-time wage agreement at Jacksonville, Fla., to run from Apr. 1, 1924, to Mar. 31, 1927, had removed the possibility of interruption by strike. Average sales prices in 1925 were cut by approximately 25 per cent and over 100,000 men were laid off because of the forced shutdown of many mines and production curtailment at others. The year 1926 was a period of large production in the bituminous industry and the depression felt since 1924 was temporarily less acute. During the year, four major short-time influences dominated the soft-coal market—a need for household fuel in place of anthracite during the first quarter, a large total consumption which reflected record industrial activity, a windfall export trade in the wake of a seven-month strike in the United Kingdom, and in the closing months of the year purchases for storage against the anticipated suspension in the union bituminous fields on Apr. 1, 1927. Production for November, 1926, was 59,213,000 tons, a gain of 2,013,000 tons over the previous monthly record set in October, 1919. The anthracite strike lasted 170 calendar days and was the longest in the history of the anthracite region. Despite the suspension of mining in the first six weeks of 1926, the year's production of anthracite nearly equalled the average of other recent years. On February 12, a new agreement was signed between miners and operators to run until Aug. 31, 1930. The agreement continued the wages and working conditions existing before the suspension, but provided that at any time after Jan. 1, 1927, either party might propose modifications in the wage scale, and means for considering such modifications were also provided. On Apr. 1, 1927, the looked-for strike in the bituminous coal mines became effective, continuing into 1928. Production of both grades of coal declined from 1926, a condition that is largely accredited to the unusually mild winter of 1926-1927. The export trade was featureless.

The year 1928 was featured by unemployment in many of the union-controlled districts. The proportion of non-union coal produced was considerably larger. Detailed statistics as to production and consumption are not yet available,

**Mechanization.** In recent years, there has been a great growth in mechanization of the American coal industry and, in addition to cutting machines and haulage locomotives, loading machines and conveyors are being increasingly employed. From approximately 2,000,000 tons in 1923, the production of bituminous coal by mechanized mining increased to 21,559,000 tons in 1928. These devices consisted mainly in devices to reduce the labor of hand shoveling into mine cars. In 1928 according to the United States Bureau of Mines, the following tonnage was produced by various types of devices: By mobile loading machines, 11,811,000 tons, or 54.8 per cent; by scrapers, 1,548,000 tons, or 7.2 per cent; by pit-car loaders, 4,117,000 tons, or 19.1 per cent; and by conveyors, including duckbills, 4,083,000 tons, or 18.9 per cent.

**World's Production of Coal.** The world's production of coal of all grades in 1928 was estimated by the U. S. Bureau of Mines at approximately 1,444,000,000 metric tons. (A metric ton is 2204.6 pounds, roughly the same as the gross ton of 2,240 pounds). Of the grand total, 217,000,000 tons were lignite, and 1,227,000,000 tons were bituminous coal and anthracite. In 1913, the last year before the World War, the production of lignite was 129,000,000 and the production of bituminous and anthracite, 1,213,000,000 tons. The output of lignite thus shows a very large increase over the pre-war level, chiefly on account of the rapid growth of the German lignite industry. The output of coal proper, on the other hand, shows an increase of only 1 per cent. Whereas, in the quarter-century before 1913, the production of bituminous and anthracite grew at the average rate of 31,000,000 tons every year, in the entire 15 years since then it has grown only 14,000,000 tons.

**British Coal Industry.** At the end of March, 1921, the policy of department control was ended in Great Britain, and the industry was restored to private ownership. This involved the reduction of wages and the abandonment of state subsidies. Already a point had been reached where, with the highest wages on record, there had resulted the lowest average output per miner ever recorded. Unemploy-

ment and strikes now developed in the industry, and readjustment was imperative; this, by the following year, was more or less satisfactorily accomplished. British wages this year decreased 40 per cent in the leading coal fields and, while coal was exported, it was at prices that did not permit of profit. In the following year, 1922, however, the industry was restored to a more normal basis, producing 255,891,786 metric tons; and in 1923 this was increased to over 260,000,000 tons. In 1924 production was well maintained at close to the 1923 mark. A considerably larger decline was noted in 1925, however, and in 1926 production was reduced by about 50 per cent by the national stoppage which reduced the total activity of the British coal trade to less than six months. This great strike was of major economic significance, not only to the British industry which suffered one of its most disastrous years, but to the United States and European countries which were called upon to furnish coal for British consumption, thereby increasing the activity and appearance of prosperity in some of the other important coal-producing countries of the world during 1926.

The British coal industry during 1927 passed through three more or less distinct phases. The first period was one of optimism, great activity, and remunerative trade—a natural reaction from the disastrous stoppage which came to an end toward the close of 1926. The second period was one of intense competition, particularly for the regaining of export markets, with steadily and rapidly declining price-levels, increasing unemployment, substantial trading losses, and general depression throughout the industry. In the third period, which comprised the closing months of the year, depressed conditions and trading losses continued, and, largely as a result, there was a growing tendency toward reorganization and reconstruction of the industry to meet the changed conditions prevailing in the world coal trade. An outstanding feature of the year was the recovery of productive activity to a level exceeding that in the period immediately preceding the 1926 stoppage.

In 1928 further progress toward the industry's return to normalcy was recorded. A definite end to the long-continued drop in prices was noted and the markets exhibited a more buoyant air. Continental nations showed signs of opening their markets to British coal once more and the general feeling was that really substantial progress was being made in the rehabilitation of the British coal industry.

**French Coal Industry.** Recent years have marked great progress in the restoration of France's coal-producing industry. Following the nearly complete destruction of the French

mines by the Germans during the War, the output was steadily built up until in 1924 it passed the pre-war mark recorded in 1913. Since 1924 the progress has been equally good as the accompanying table indicates.

**German Coal Industry.** The unsuccessful outcome of the War was indeed serious for Germany, so far as the coal industry was concerned, in its bearing on manufacturing. In 1913 the German coal production was in excess of 190,000,000 metric tons of bituminous coal and 87,000,000 tons of lignite, in addition to coke and briquettes, as specified in the accompanying table. Of this amount, Germany was able to export 34,598,408 tons, or an excess of 24,058,339 tons over domestic consumption. Naturally, during the War, the exports of Germany were confined to adjacent neutral countries; after the Armistice, Germany was stripped permanently of coal lands which had been considered invaluable to its industry.

#### PRODUCTION OF COAL AND FUEL IN THE GERMAN EMPIRE

	(Metric Tons)		
	1913	1922	1927
Bituminous	190,109,440	129,964,597	153,598,000
Lignite	87,283,084	137,207,125	150,805,000
Coke	34,630,391	29,664,291	32,260,000
Bituminous briquettes	6,992,499	5,562,811	4,971,000
Lignite briquettes	21,498,397	29,466,149	36,468,000

In 1922 the German inland requirements of bituminous coal were estimated at 150,000,000 tons, and for this, as will appear in the accompanying table, approximately 130,000,000 tons were available. The loss of coal-production capacity in Germany was due first to the fact that rich coal areas in Upper Silesia, which in 1913 had produced 32,500,000 tons of coal, or 17 per cent of the entire product of the nation, were allocated to Poland, while Alsace-Lorraine, which in 1913 had produced 4,790,000 tons, was returned to France. In addition, Germany lost the Saar Basin and the Palatinate for 15 years, at the end of which a plebiscite was to be taken to determine the sovereignty of these areas, which, in 1913, produced 12,223,000 tons of coal; in 1920, 9,410,433 tons, and in 1921, 9,574,602 tons. Furthermore, the German coal industry was restricted by reduced hours of labor, which were materially decreased from those prevailing before the War, while labor itself was marked by less efficiency.

Industrial activity in Germany was enhanced by the operation of the Dawes plan. The loss of the higher-grade coal mines is plainly reflected in the accompanying table which shows that the percentage of lignite produced is increasing with great rapidity. Germany was a leader in the rationalization-of-industry movement that followed the World War and it appears that this movement will do much toward the reestablishment of German industry on a plane not far below that existing prior to the War. The trend of production undoubtedly is upward and an equable settlement of the reparations plan will doubtless do much to improve the industrial situation further. In 1928 the total anthracite and bituminous coal from German mines amounted to 150,900,000 metric tons.

**Belgian Coal Industry.** The fact that the Germans did not completely destroy the Belgian mines, as they had those in France during the War, worked to the advantage of the programme

#### PRODUCTION OF COAL IN FRANCE (Metric Tons)

1913	40,844,218
1914	26,568,258
1915	19,523,863
1916	21,310,000
1917	28,891,728
1918	25,000,000
1919	22,476,766
1920	25,274,304
1921	28,940,473
1922	31,940,845
1923	38,543,670
1924	44,955,320
1925	48,033,564
1926	52,467,522
1927	52,846,698
1928	52,530,000

of rehabilitation that was started upon immediately following the Armistice. The low point of production was recorded in 1918 when 13,887,600 metric tons of coal was produced. By 1927 this figure had been increased to 27,573,550 metric tons. Present output is in excess of domestic consumption though with the return of Belgian industry to its pre-war level of activity, some of the additional requirements will need to be fulfilled by the import trade.

Consult current issues of *The Coal Age*, and also Part I; *Atlas of Commercial Geology*, "Mineral Resources and Mineral Industry."

WORLD'S PRODUCTION OF COAL  
(In Metric Tons)

	Production in part (Estimated)	Per cent Produced by United States
1918	1,341,000,000	38.5
1914	1,208,000,000	38.5
1915	1,190,000,000	40.5
1916	1,257,000,000	42.7
1917	1,325,000,000	44.6
1918	1,332,000,000	46.4
1919	1,168,000,000	43.1
1920	1,319,000,000	45.3
1921	1,136,000,000	40.4
1922	1,208,000,000	34.6
1923	1,360,000,000	43.9

1925	1,361,000,000	38.7
1926	1,355,000,000	44.9
1927	1,475,000,000	40.6
1928	1,444,000,000	39.4

**COAL LOADERS.** See ELECTRIC MOTORS IN INDUSTRY.

**COAL STRIKE.** See COAL; STRIKES AND LOCKOUTS.

**COAST DEFENSE.** See ARTILLERY.

**COATES, ALBERT** (1882- ). A British orchestral conductor, born (of an English father and a Russian mother) at Petrograd. Although he had studied piano with an older brother, he did not decide on a musical career until he was 20. He then entered the Leipzig Conservatory, where his teachers were Teichmüller (piano), Klengel ('cello) and Nikisch (conducting). He made his debut as conductor with Offenbach's *Contes d'Hoffmann* in Leipzig. Upon the recommendation of Nikisch, he was appointed principal conductor of the Elberfeld opera in 1906. After a short time as Schuch's assistant in Dresden, he went to Mannheim as coordinate conductor with Bodanzky. Here, the director of the Imperial Opera at Petrograd heard him and engaged him in 1911 for that institution, where Coates remained through the horrors of the revolution until 1919. In 1914 he made his first appearance in London, alternating with Bodanzky in the first performances of *Parsifal* in England. In 1919 he returned as conductor for Beecham's operatic company, directing also some concerts of the London Philharmonic Society and of the Symphony Orchestra. On Dec. 30, 1920, he made his American debut with the New York Symphony Orchestra with emphatic success, and for two seasons he alternated with Damrosch. During the summer of 1923, he conducted a season of Russian opera at Barcelona, and in 1924 and 1925 he was the guest-conductor of the Rochester Symphony Orchestra for the second half of the season. During the summer of 1928, he was heard at the Hollywood Bowl, in California, and the Stadium Concerts in New York. He has made a vast number of records for the Victor Company, especially of extended

excerpts from Wagner's works. He is the composer of an opera, *Sardanapalus* (Petrograd, 1916), a symphonic poem, *The Eagle* (Leeds Festival, 1925), and of some orchestral works, in smaller form.

**COATES, THE RT. HON. JOSEPH GORDON** (1878- ). A New Zealand statesman, who was born in Matakohē, educated at the public school there. He was elected to the House of Representatives in 1911, served with the British forces in France, 1917-19, and became Minister of Justice (1919-20), Postmaster General and Minister of Telegraphs (1919-25), Minister of Public Works (1920-26), of Native Affairs (1921-28), and of Railways (1923-28). In 1925 he became Premier, retaining the last two portfolios and adding that of External Affairs in 1928. In 1926 he was made a member of the Privy Council. In December, 1928 a "no confidence" vote forced his resignation.

**COBB, FRANK IRVING** (1860-1923). An American editor and writer, born in Shawnee County, Kan. He was educated in the public schools and at the Michigan State Normal School, beginning newspaper work for the Grand Rapids *Herald* when he was 21 years old. Before being invited to New York by Joseph Pulitzer, he had been chief editorial writer on the Detroit *Free Press* (1900-04), having just previous to that been on the Detroit *Evening News*. Mr. Cobb directed the editorial page of the New York *World* for 20 years (1904-23), and became recognized as, perhaps, the strongest writer on the New York press since Horace Greeley. He has been described as a writer who shunned sophistry and wrote sincerely and simply. Though his editorials were not signed and were written for a paper that he did not own, he became a powerful personality in the United States. In October, 1918, Mr. Cobb was drafted into national service as an unofficial adviser at the Peace Conference, where he was an admirer of President Wilson and a firm advocate of the League of Nations.

**COBB, IRVIN S (HREWSBURY)** (1876- ). An American author, born at Paducah, Ky., and educated at the common schools and in private academies. He began as a reporter for papers in Paducah and Louisville. From 1904, when he became editor of the humorous section of the New York *Evening Sun*, he was section editor or contributor to New York newspapers, notably the *World*. In 1911 he became a staff contributor to the *Saturday Evening Post*, for which he was also war correspondent in Europe at intervals between 1914-18. Among his numerous works are the following: *Funabashi* (a musical comedy, 1907); *Mr. Busyboddy* (musical comedy, 1908); *Back Home* (1912), produced as a comedy (1915); *Cobb's Anatomy* (1912); *The Escape of Mr. Trimm* (1913); *Cobb's Bill of Fare* (1913); *Roughing It de Luxe* (1914); *Europe Revised* (1914); *Paths of Glory* (1915); *Old Judge Priest* (1915, 1923); *Fibble, D.D.* (1916); *Speaking of Operations* (1916); *Local Color* (1916); *Speaking of Prussians* (1917); *Those Times and These* (1917); *The Glory of the Coming* (1918); *The Thunders of Silence* (1918); *The Life of the Party* (1919); *From Place to Place* (1919); *Oh, Well, You Know How Women Are!* (1919); *The Abandoned Farmers* (1920); *A Plea for Old Cap Collier* (1921); *One Third Off* (1921); *Sundry Accounts* (1922); *Stickfuls* (1923); *A Laugh a Day Keeps the Doctor Away* (1923); *The*

*Snake Doctor* (1923); *Goin' on Fourteen* (1924); *Here Comes the Bride!* (1925); *Some United States* (1926); *Ladies and Gentlemen* (1927); *All Aboard* (1928); *Red Likker* (1929), and numerous series in periodicals. He also collaborated on dramatic productions.

**COBB, TR(US RAYMOND)** (1886- ). Professional baseball player, born at Narrows, Ga. After a brief stay in the minors, he joined the Detroit Club of the American League in 1905, becoming manager of that club, 1920-26. He played the seasons of 1927 and 1928 with the Philadelphia Athletics. He is regarded as one of the best all-round players America's national game has ever developed, being especially renowned as a batsman and in his earlier career for his speed on the base paths. See *Ty Cobb, the Idol of Baseball Fandom*, by Sverre O. Braathen (1928).

**COBERN, CAMDEN MCCORMACK** (1855-1920). An American professor of theology, born at Uniontown, Pa., and educated at Allegheny College, Boston University, and in Europe. He was ordained to the ministry of the Methodist Episcopal Church in 1878, and was thereafter member of several conferences. In 1906 he became professor of the English Bible and the philosophy of religion in Allegheny College. Among his works are *Ancient Egypt in the Light of Modern Discovery* (1892); *A Critical Commentary on the Books of Ezekiel and Daniel* (1901); *Bible Ditchings of Immortality* (1905); *Recent Explorations in the Holy Land* (1914); *Studies of Immortality* (1918); and *The New Archaeological Discoveries and Their Bearing upon the New Testament and upon the Life and Times of the Primitive Church* (1917, 1921).

**COBLE, ARTHUR BYRON** (1878- ). An American mathematician, born at Williamstown, Pa. He was graduated at Pennsylvania College, Gettysburg, in 1897, after which he studied at Johns Hopkins University. He was instructor in mathematics at the University of Missouri in 1902-03. After a year of research work, he returned to Johns Hopkins as instructor in mathematics and continued there until 1918, attaining in 1909 an associate professorship. In 1918 he was called to the chair of mathematics at the University of Illinois. Called to Johns Hopkins as professor of mathematics in 1927, he returned to Illinois the following year. Among the subjects on which he has published the results of his studies are the theory of invariants, groups and correspondences, the quintic and sextic equations, symmetric binary forms and involutes, point set and cremona groups, and porisms. He was an associate editor of the *American Journal of Mathematics* during 1915-19.

**COBURN, CHARLES DOUVILLE** (1877- ). An actor-manager born at Macon, Ga. When he was 18, he became manager of the Savannah (Ga.) Theatre and two years later took up the stage as a profession. He played in stock through the Middle West and starred in *The Christian* and other plays. The Coburn Players were organized by him in 1905 for the production and promotion of the classic drama. He owns and controls the American and Canadian rights to *The Yellow Jacket* and *The Better 'Ole*. It was this last production which gave him his reputation. He created the rôle of "Old Bill" and later of "French Leone" (1920-21). He produced *So This Is London* (1922-24), *The Farmer's Wife* (1925), *The Right Age to Marry*, and *Old Bill, M. P.* (1926).

**COBURN, MRS. FORDYCE.** See ABBOTT, ELEANOR HALLOWELL.

**COCHIN, kô'shân', HENRY DENYS BENOIT MARIE** (1854-1927). A French writer and legislator (see VOL. V), who in 1914, retired from the Chamber of Deputies in favor of his son. His later works include: *Les deux guerres* (1917); *L'œuvre de guerre du peintre Albert Besnard* (1918), and a translation of *Les triomphes*, by Petrarca (published in the collection *Les cent chefs-d'œuvre étrangers*, 1920). He also wrote "L'art chrétien sur les confins des XIX<sup>e</sup> et XX<sup>e</sup> siècles," in *La vie Catholique dans la France contemporaine* (1918), and "L'âme du Nord," in *Le Nord dévasté* (1920). Consult "Un humaniste chrétien," by Maurice Denis in the *Revue hebdomadaire* (Paris) Année 36, vol. 10 pp. 591-607 (1927).

**COCHIN-CHINA.** See FRENCH INDO-CHINA.

**COCHRAN, kôk'ran, CHARLES BLAKE** (1873- ). A theatrical manager born in Sussex, England. He was educated at Oxford, became an actor and made his first appearance in New York. Subsequently, he was press representative to various theatres, circuses, and exhibitions in the United States. For three years, he was personal representative of the late Richard Mansfield. After 1917 he became responsible for the productions of the Oxford Theatre and produced *The Better 'Ole*. His other successes include: *In the Night Watch* (1918); *The Man Who Came Back* (1920); *The League of Nations* (1921); *As You Were* (1918). Since 1926 he has been manager of Albert Hall. He wrote *The Secrets of a Showman* (1925).

**COCKRAN, WILLIAM BOURKE** (1854-1923). A distinguished American lawyer and orator (see VOL. V). He was active throughout his career in Democratic politics and was at the time of his death a member of Congress.

**COCOTEAU, kôk'tô', JEAN** (1891- ). A French poet and pamphleteer born at Maison-Laffite, France, whose work was a barometer of contemporary developments in art and music. Thus, he wrote both Cubist and Dadaist poems, besides pamphlets in which he justified his own evolution. He did not hesitate to condemn his own works after he came to a new point of view in regard to the art of literary expression. He seemed more at ease in the pamphlet than in any other type of writing, his most brilliant and successful work being perhaps, *Le Coq et l'arlequin: Notes autour de la musique* (1918). His first novel, *Le Grand écart*, appeared in 1923 and, like his poems, it was impressionistic. His other works include: *La Lampe d'Aladin* (poem, 1909); *Le Prince frivole* (poems, 1910); *La Danse de Sophocle* (poems, 1912); *L'Art décoratif de Léon Bakst* (with Arsène Alexandre, 1914); *Prélude à l'après-midi d'un faune* (with others; 1915); *Le Cap de Bonne-Espérance*; *Potomak* (dedicated to Stravinsky, and afterward condemned by the author); *Parade* (a ballet with music by Eric Satie, 1917); *Les Morlés de la tour Eiffel*; *Thomas l'imposteur* (1923); *Dessins* (1923); *Lettres à Jacques Maritain* (see also his *Réponse à Jean Cocteau*, 1926); *Orphée* (1927), and *Edipe-Roi*; *Roméo et Juliette* (1928).

**CODLING MOTH.** See ENTOMOLOGY, ECONOMIC.

**COD-LIVER OIL.** See FOOD AND NUTRITION.  
**CODY, VEN. HENRY JOHN** (1868- ). A Canadian educator and clergyman (see VOL. V). He was Archdeacon of York, Canada (1909-19).

In 1914-15 he was a member of the Ontario Commission on Unemployment. He was Minister of Education in the same province in 1918-19, and in 1921 chairman of the Commission on University Finances in Ontario. Elected Archbishop of Melbourne, Australia, in the same year, he declined the office. At Geneva, in September, 1926, he preached the English sermon for the Seventh Assembly of the League of Nations.

**COE COLLEGE.** An institution at Cedar Rapids, Iowa, founded in 1881. The student enrollment in Liberal Arts increased from 742 in 1918 to 831 in the year 1928-29, with 307 in the college in the summer of 1928. The faculty was increased in the same period from 47 to 75 members, and the library from 15,920 to 30,855 volumes. During 1928 a gymnasium costing \$250,000 was being erected. Harry Morehouse Gage, D.D., LL.D., succeeded John Abner Marquis, D.D., LL.D., as president in 1921.

**COFFIN, HENRY SLOANE** (1877- ). An American clergyman and author, born in New York, educated at Yale University, at New College, Edinburgh, the University of Marburg, and the Union Theological Seminary, New York. He was ordained to the Presbyterian ministry in 1900, and after five years as pastor of the Bedford Park Church, New York, was appointed to the Madison Avenue Church in the same city in 1905. In the previous year, he had been named associate professor of practical theology in the Union Theological Seminary. He resigned the pastorate in 1926, becoming president of the Seminary. He was several times preacher to universities, including Yale and Harvard. Aside from editing and collaborating, he wrote a number of books, among them: *The Creed of Jesus* (1907); *Social Aspects of the Cross* (1911); *The Christian and the Church* (1912); *University Sermons* (1914); *The Ten Commandments* (1915); *Christian Convictions* (1915); *In a Day of Social Rebuilding* (the Lyman Beecher Lectures, at Yale University, 1918); *A More Christian Industrial Order* (1920); *What is there in Religion?* (1922); *Portraits of Jesus Christ* (1926); and *What to Preach* (1926).

**COFFMAN, DE WITT** (1854- ). An American naval officer, born in Shenandoah Co., Va. He graduated from the United States Naval Academy in 1876. During the Spanish-American War, he served on the *Terror*. He was appointed lieutenant commander in 1899; commander in 1905; captain in 1909, and rear-admiral in 1914. He served in many capacities, both ashore and afloat, and in 1916 was commander of the 3d Division of the Atlantic Fleet. Later in the same year, he commanded the 6th Division of the Atlantic Fleet, and in June, 1916, he was promoted to the rank of vice admiral. He commanded the second battleship force in 1918 and in the same year was given the command of the 5th Naval District and Naval Operating Base at Hampton Roads. On Nov. 28, 1918, he was retired by operation of law. He was a member of the Board of Awards, Medals and Honors until Oct. 30, 1919.

**COGHLAN, kōg'lan, Sir TIMOTHY AUGUSTINE** (1856-1926). An Australian statistician (see Vol. V). He was created knight in 1914 and Knight Commander of the Order of St. Michael and St. George in 1918. He was again Agent General for New South Wales in 1916-17 and 1920-25. In 1918 he published *History of Labour and Industry in Australia* (4 vols.).

**COHAN, GEORGE M (MICHAEL)** (1878- ). An American playwright and producer (see Vol. V). His recent successful plays and productions include: *Hit-the-Trail Holiday*; *Abie's Irish Rose*, written by Anne Nichols, *The Song and Dance Man*, *The Rise of Rosie O'Reilly*, a satire on Cinderella, and *The Merry Malones* (a musical play, 1927).

**COHEN, BELA.** See KUN, BELA.

**COHEN, JULIUS HENRY** (1873- ). An American lawyer. He was born in Brooklyn, N. Y., and was graduated from the Law Department of New York University in 1896. In the following year he was admitted to the bar and began practice in New York City. He served as city attorney of the Transit Reform Committee of One Hundred (1900 to 1905) and as special counsel to the Public Service Commission and to the Port of New York Authority. He was a member of several legal societies and was the author of *Law and Order in Industry* (1916); *The Law—Business or Profession* (1916); and *American Labor Policy* (1918). He was a frequent contributor to legal periodicals.

**COHEN, MORRIS RAPHAEL** (1880- ). An American professor of philosophy born in Minsk, Russia. Taken to America when still a child, he was educated at the College of the City of New York, and pursued graduate studies in philosophy under Royce and James at Harvard, receiving the doctorate in 1908. He taught mathematics and philosophy at the College of the City of New York and at intervals at Columbia University, Johns Hopkins, and the New School for Social Research (New York), after 1923. Professor Cohen also contributed polemical writings on political and social questions to the *New Republic* and other journals.

**COHEN, OCTAVUS ROY** (1891- ). An American author, born in South Carolina where he received his secondary and college education. At first an engineer, he soon drifted into journalism, which he relinquished for authorship in 1915. He immediately became popular as a result of his stories printed in the *Saturday Evening Post* which concerned themselves with the adventures of the Southern Negro. If his people seemed to possess the usual mythical Negro qualities of drollery and miscomprehensions, his tales at any rate were spirited. Among others he wrote: *Polished Ebony* (1919); *Gray Dusk* (1920); *Come Seven* (1920); *Highly Colored* (1921); *Midnight* (1922); *Dark Days and Black Knights* (1923); *Bigger and Blacker* (1925); besides some plays and mystery romances.

**COKE.** Subsequent to 1914, many important developments were recorded in the manufacture of coke which normally requires about 15 per cent of the bituminous coal produced in the United States. When the demand for coke is active, the requirements are between 75 and 85 million tons of raw coal a year for smelting the ores of iron and other metals, as well as for use in foundries, and as a smokeless domestic fuel. The production of beehive coke involves the loss of many valuable by-products, as benzol, toluol, and ammonia, which could be obtained by the distillation of coal in the by-product oven, and for which there was an increased demand at the beginning of the World War, for use in the manufacture of explosives. In 1919, 56 per cent of all the coke manufactured in the United States was made in by-product ovens, and by 1928 the percentage had increased to 91.8 per cent.

The economic advantage of the use of the by-product oven is shown by the fact that a ton of coal of 2000 pounds so treated would yield approximately 19 pounds of sulphate of ammonia, 7.1 gallons of tar, 2.4 gallons of crude light oil, 10,500 cubic feet of gas, and 1425 pounds of coke. The ammonia thus obtained can be used in refrigeration, for the manufacture of high-explosive ammonia nitrate (see EXPLOSIVES), and for making the fertilizer ammonium sulphate. From the tar are derived many organic compounds, such as the aniline dyes, and the ultimate residue, coal-tar pitch, is employed in road making, in making roofing, and as a binder for the fuel briquettes. In refining the tar, some crude light oil is obtained but much more is secured by washing the coke-oven gas. The crude light oil is valuable inasmuch as it yields benzol, the base of picric acid, and toluol, the base of the explosive trinitrotoluol, or TNT, which was employed so extensively in the World War. The distillation of coal is also important for its yield of illuminating gas for domestic or industrial purposes.

Blast furnaces consume a large proportion of the coke produced in the United States. In 1928 the consumption of coke amounted to 51,796,000 tons and, of this amount, 39,700,000 tons or 76.7 per cent, were consumed in blast furnaces. The remainder was used in foundries, in smelting the non-ferrous metals, in the manufacture of water-gas, in miscellaneous other industrial uses, and for household heating. The quantity of coke used for house heating has increased since the war period, as shown by the higher percentage of coke used in other ways than for furnace use. The production of coke in 1926 set a new record at 56,865,537 tons, due to the fact that it was in demand to meet the deficit in anthracite coal production caused by the miners' strike in that year. The decrease of 10.4 per cent shown by the 1927 figures was attributed in part to an abundant supply of anthracite in that year and particularly to the diminished activity of the blast furnaces caused by a 7.3 per cent decline as compared with 1926, in pig-iron output. The total production in 1928, 52,582,000 tons, was an increase of 2.9 per cent over 1927, with a new record for by-product coke, 48,205,577 tons, or 9.8 per cent increase over 1927.

The output of beehive coke declined from 72.5 per cent of the total coke production in the United States in 1913 to 8.3 per cent in 1928, while that of by-product coke increased from 27.5 per cent to 91.7 per cent. The decreased production in the beehive branch of the industry was due to the fact that it was assuming the position of an auxiliary which supplied only the surplus requirements of the metallurgical industry which could not be met by the by-product industry. Figures show that the output of beehive coke fell from 10,286,000 tons in 1924 to 4,376,000 tons in 1928, while the output of by-product ovens—33,934,000 tons in 1924—increased to 48,205,577 tons in 1928. The number of by-product plants devoted to the production of coke in 1913 was 36; in 1928 the number had increased to 83. Of this total, 46 were affiliated with iron furnaces and 37 were non-furnace plants, the former group producing 77.7 of the total output. Due to developments in the coke industry the allocation of certain plants was changed from "furnace" to "other" and vice versa, a change which is reflected in certain statistics

as compared with those previously published by the Department of Commerce.

The exports of coke from the United States in 1928 totaled 980,039 tons, valued at \$7,394,531, and corresponding figures for imports of coke were 131,876 tons and \$1,132,855.

PRODUCTION OF COKE IN THE UNITED STATES  
STATISTICAL AND ECONOMIC SURVEY U. S. BUREAU OF  
MINES

Year	Beehive	Per cent of total	By-product	Per cent of total	Total
1913	33,584,830	72.5	12,714,700	27.5	46,299,530
1914	23,335,971	67.5	11,219,943	32.5	34,555,914
1915	27,504,255	66.2	14,072,895	33.8	41,581,150
1916	35,464,224	65.0	19,072,895	35.0	54,533,585
1917	33,167,548	59.6	22,439,280	40.4	55,606,828
1918	30,480,792	54.0	25,997,580	46.0	56,478,372
1919	19,042,936	43.1	25,137,621	56.9	44,180,557
1920	20,511,092	40.0	30,833,951	60.0	51,345,043
1921	5,538,042	21.9	19,749,580	78.1	25,287,622
1922	8,573,000	23.1	28,551,000	76.9	37,124,000
1923	19,379,870	34.0	37,597,664	66.0	56,977,534
1924	10,286,037	23.2	33,933,568	76.8	44,269,605
1925	11,354,784	22.1	39,912,159	77.9	51,266,943
1926	12,488,951	22.0	44,376,586	78.0	56,865,537
1927	7,004,000	13.8	43,921,000	86.2	50,925,000
1928	4,376,000	8.3	48,206,000	91.7	52,582,000

The production of by-product coke in 1928, as stated, amounted to 48,206,000 tons, a considerable increase as against 39,912,159 tons in 1925. The relative proportions of beehive and by-product coke used have undergone a considerable change since 1913 when the beehive ovens contributed 72.5 per cent of the total, and the by-product ovens 27.5 per cent, as against an average of 8.3 per cent and 91.7 per cent, respectively, in 1928. Pennsylvania, which led in the production of beehive coke, together with Ohio produced 72.7 per cent of the total output of this product in 1928. Pennsylvania, likewise, was the leading producer of by-product coke, the output of which exceeded that of beehive coke. The output of the by-product ovens in 1928 was 13,623,000 tons. Ohio ranked second, Indiana third, Alabama fourth, and New York fifth.

A partial explanation for the marked decrease in the output of coke from 1926 was found in the fact that in that year there was a greater demand for coke to meet the deficit in anthracite, due to the miners' strike, while the supply of anthracite was abundant in 1927. The diminished activity of blast furnaces in the latter year, however, was the principal cause for a decrease, because pig-iron production then declined 7.3 per cent below the 1926 level. In 1928 it increased 4.4 over 1927. When due allowance was made for exports and imports, the estimated consumption of coke in 1927 was 51,796,276 tons, of which about 39,700,000 tons were consumed in blast furnaces, and the remainder in foundries, in smelting the non-ferrous metals, in the manufacture of water-gas, in miscellaneous other industrial uses, and for household heating. The latter item has been on the increase since the War, as indicated by the lower percentages shown for furnace use. Blast furnaces continued, however, to consume the largest proportion of coke, the percentage in 1928 being 76.6 per cent of the total consumption.

The potential coking capacity of by-product plants at the end of 1928 on the basis of 100 per cent operation under favorable conditions amounted to about 58,000,000 net tons, an increase of more than 5,000,000 tons over 1927, due to the addition of 511 new ovens. There were, in addition, approximately 100 new ovens under construction at the end of 1928 which

would bring the capacity up to 58,600,000 tons at 100 per cent operation. At this rate the plants in existence have a coal-carbonizing capacity of 82,800,000 tons of bituminous coal, which will be increased later to 84,600,000 tons through the addition of new ovens. There were 83 by-product plants producing coke in 1923, of which 46 were affiliated with iron furnaces, and 37 with non-furnace plants. The furnace plants produced 79.1 per cent of the total, and the non-furnace plants 20.9 per cent. See CHEMISTRY, APPLIED.

**COKER, WILLIAM CHAMBERS** (1872- ). An American botanist, born at Hartsville, S. C. He graduated from South Carolina College in 1894 and took postgraduate courses at Johns Hopkins University and in Germany. He taught for several years in the summer schools of the Brooklyn Institute of Arts and Sciences, at Cold Spring Harbor, L. I., and in 1902 became associate professor of botany at the University of North Carolina. He was made professor in 1907 and Kenan professor of botany in 1920. Professor Coker was a member of many scientific societies and the author of *The Plant Life of Hartsville, S. C.* (1912); *The Trees of North Carolina* (with H. R. Totten, 1916); *The Saprolegniaceae of the United States* (1921); *The Clavariaceae of the United States and Canada* (1923). Besides these, he contributed numerous articles on morphology and botany to scientific periodicals.

**COLBY, BAINBRIDGE** (1869- ). An American lawyer and statesman, born at St. Louis, Mo., and educated at Williams College and at the Columbia and New York University law schools. In 1892 he began the practice of law in New York. From 1901, when he was elected a member of the New York Assembly, he took an active interest in State and National politics, being one of the founders of the Progressive National Party. He served on numerous boards and commissions of the Government and in 1917 was a member of the American Mission to the Inter-Allied Conference in Paris. In 1920-21 he was Secretary of State in President Wilson's cabinet.

**COLBY, EVERETT** (1874- ). An American lawyer (see VOL. V). He was a member of the Republican National Committee from 1916 to 1920. In 1917 he served in the United States Food Administration, was major in the Officers' Reserve Corps in 1918, and chairman of the executive committee of the League of Nations Non-Partisan Association founded in January, 1923.

**COLBY COLLEGE.** A liberal arts college at Waterville, Me., with coördinate divisions for men and women; founded in 1813. The student enrollment increased from 440 in 1916 to 631 in the autumn of 1928, when it was divided as follows: men, 383; women, 248; and the faculty numbered 33 men and 3 women in 1928. The endowment was \$1,350,000 and the income \$259,350. The number of bound volumes in the library increased from 50,000 in 1914 to 75,000 in 1928. Recent developments included the erection of an Alumnae Health Building, providing physical education facilities for women; plans for a new gymnasium for men, for which ground was to be broken in the spring of 1929; and a new department of business administration. Arthur J. Roberts, LL.D., president since 1908, died on Oct. 11, 1927, and in the autumn of 1928 the administrative authority of the college

was vested in an executive committee of which Professor Ernest C. Marriner was chairman.

**COLE, LEOBON J. (ACON)** (1877- ). An American zoölogist born at Allegany, N. Y. He was educated at the University of Michigan (A.B., 1901) and at Harvard (Ph.D., 1906). He was assistant in zoölogy at Michigan (1898-1902); Austin teaching fellow, Harvard (1903-06); chief of the division of animal breeding at the Rhode Island Experiment Station (1906-07); and instructor in zoölogy, Yale (1907-10). In 1910 Professor Cole went to the College of Agriculture, University of Wisconsin, where he was successively associate professor of experimental breeding (1910-14), professor (1914-18), and professor of genetics (1918- ). In 1923-24 he was on leave as chief of the animal husbandry division of the Bureau of Animal Industry, U. S. Department of Agriculture. In 1926-27 he was chairman of the division of biology and agriculture of the National Research Council.

**COLE, TIMOTHY** (1832- ). The foremost American wood engraver (see VOL. V). His latest undertaking was a series of carvings of old masters in American public and private galleries. He published with his own illustrations, *Wood Engraving: Three Essays* (Grollier Club, New York, 1916), and *The Magic Line, a Study of the Technique of Wood Engraving* (New York, 1917).

**COLEMAN, ARTHUR PHILEMON** (1852- ). Emeritus professor of geology in Toronto University (see VOL. V). He was president of the Geological Society of America in 1915 and of the Royal Society of Canada in 1921. He published, with W. A. Parks, *An Elementary Geology* (1922). Besides his reports on the economic geology of Ontario (in *Bureau of Mines Reports and Geological Survey of Canada*), he is the author of *Canadian Rockies; New and Old Trails, and Ice Ages, Recent and Ancient* (1926).

**COLES, JONATHAN ACKERMAN** (1843-1925). An American physician, art collector, and philanthropist, born at Newark, N. J. He received degrees from Columbia University in arts (1864) and in medicine (1868). After continuing his studies (1877-78) in European universities and hospitals, he began to collect art objects and bestow them on institutions and cities. Among the recipients were the City of Newark, the Metropolitan Museum of Art (New York), and the universities of Columbia, Yale, Harvard, Oxford, and Cambridge. He was a co-founder of the Valley Forge Library. His purely philanthropic work comprised the building of homes at Mountainside, Union Co., N. J., for orphaned, crippled, and friendless children, and educational buildings in the Far East. He held memberships in many medical, historical, charitable, and religious organizations.

**COLETTE, kô-jët'** (1873- ). Pseudonym of a French novelist who first married Henry Gauthier-Villars, a writer using the pseudonym of Willy, and with him wrote *Claudine*, four volumes of her adventures (1900-03), under the name of Colette Willy. She then married Henri de Jouvenel (1912). She received recognition by being made a chevalier of the Legion of Honor. Her works include: *L'Ingénue libertine*; *Dialogues de bêtes*; *L'Envers du Musio Hall*; *La retraite sentimentale* (1907); *En Camarades*; *La Vagabonde*, dramatized in 1923 (1910); *L'Entrave* (1913); *La paix chez les bêtes* (1916); *Les heures longues* (1917); *Dans la foule*, essays (1918); *Mitou* (1919); *Chéri*,

dramatized in 1922 (1920): *La Chambre éclairée*; *La Maison de Claudine*; *Le Blé en herbe*; *La femme cachée*, short stories (1924), and *La fin de Chéri* (1926).

**COLGATE UNIVERSITY.** A non-sectarian institution for men at Hamilton, N. Y., founded in 1819. With the exception of the two war years, 1917-19, the University showed a steady growth for the period between 1914 and 1928, the student body increasing from 518, to 993 in the autumn of 1928; the faculty, from 47 to 84; the library, from 80,000 to 114,000 volumes; and the endowment from \$2,000,000 to \$4,160,000. A chapel and a dormitory housing 200 men were built in 1922; a new recitation hall, costing \$400,000, was completed in 1926; and Eaton Hall, formerly used by the Colgate Theological Seminary, was acquired as a dormitory to be used for freshmen, in 1928; a department of personnel and a vocational-guidance and placement bureau were established in 1927. President, George Barton Cutten, Ph.D., D.D., LL.D.

**COLLEGES.** See **UNIVERSITIES AND COLLEGES.**

**COLLENS, CHARLES** (1873- ). An American architect, born in New York City and educated at Yale University and at the École des Beaux Arts in Paris. He collaborated on the plans for the buildings of the Union Theological Seminary in New York and of the Andover Theological Seminary in Cambridge, Mass.; also on those of the libraries of Ohio State University and Vassar College and of the Memorial Chapel of Williams College, as well as on the plans for the Christian Science Church in Concord, N. H., and for the Park Avenue Baptist Church, New York City.

**COLLIER, WILLIAM MILLER** (1867- ). An American diplomat (see Vol. V). He was lecturer on international law at the New York Law School until 1918. In 1915 he held the same position at Wells College, and from 1916 to 1918, he lectured on diplomacy at George Washington University, of which he was president from 1917 to 1921. In 1914 he was appointed head of the American delegation to the International Conference at Christiania, to outline a government for the Islands of Spitzbergen. He was a member of the committee on policies and platform, authorized by the Republican National Committee in 1920. In 1921 he was appointed Ambassador to Chile, a post which he resigned in 1929, after playing a leading part in the settlement of the Tacna-Arica dispute between Chile and Peru. He was the recipient of several foreign decorations, during and after the World War. He is author of: *The Law and the Higher Law* (1918); *George Washington's Will and George Washington University* (1918); *College Influences Before the War and After the War* (1920); *The Influence of Lawyers in the Past and in the Future* (in Spanish, 1921), and (with Guillermo Feliu Cruz) *La Primera Mision de los Estados Unidos en Chile* (1926).

**COLLINS, SIR WILLIAM JOB** (1859- ). A British physician and surgeon, born in London, who received his medical training at the University College Medical School there and Bartholomew's Hospital. A consulting ophthalmic surgeon to several London hospitals, he has been vice lieutenant of the County of London; vice chancellor, senator, and demonstrator of anatomy at London University; a plenipotentiary for Great Britain to the three opium con-

ferences at The Hague (1911-12, 1913, 1914); a member of Parliament (1906-10 and 1917-18), and chairman of various government boards. Besides medical works, he wrote *The Etiology of the European Conflagration* (1915); *The Ethics and Law of Drug and Alcohol Addiction* (1916); *The Life and Doctrine of Sir Edwin Chadwick* (1924). He was knighted in 1902.

**COLLINS, CHARLES WALLACE** (1879- ). An American lawyer, born at Gallion, Ala., and educated at the Alabama Polytechnic Institute, the University of Chicago, and Harvard. He was admitted to the bar in 1901 and for five years practiced in Birmingham, Ala. From 1915 to 1918, he was in charge of the economic section of the legislative reference service of the Library of Congress, and the director of this section from 1918 to 1920. He assisted in drafting a bill for a national budget and in 1920-21 was law librarian of Congress, serving also as counsel of the Bureau of the Budget. He was deputy comptroller of the currency, 1923-27, and drafted the McFadden-Pepper National Bank Bill in 1924. He wrote *The National Budget System in American Finance* (1915); *The British Budget System* (1920); *The Branch Banking Question* (1926), and contributed articles on constitutional law and public finance to many law periodicals.

**COLLINS, JOSEPH** (1866- ). An American physician, neurologist, and author, who was born in Brookfield, Conn. He received the degree of M. D. from New York University in 1888 and after some years of private practice took up the specialty of neurology, becoming professor of that subject in the New York Post-Graduate Medical School. He was later a co-founder and visiting physician to the New York Neurological Institute. He has long been known as an author. His major writings, medical and secular, are *Letters to a Neurologist* (1908; second series 1910); *The Way with the Nerves* (1911); *Sleep and the Sleepless* (1912); *Neurological Clinics* (1918); *My Italian Year* (1919); *The Doctor Looks at Literature* (1923); *The Doctor Looks at Biography* (1925); *The Doctor Looks at Love and Life* (1926); *Taking the Literary Pulse*, and *The Doctor Looks at Marriage and Medicine* (1928).

**COLLINS, ROSS ALEXANDER** (1880- ). An American lawyer and public official, born at Collinsville, Mass. He was graduated from Kentucky University in 1899, and from the Law Department of the University of Mississippi in 1901. In the same year, he began practice in Meridian, Miss. He was elected attorney general of the State in 1912 and was reelected in 1915. In 1919 he was a candidate for governor in the Democratic primary. He was a member of Congress 1921-29 for the Fifth Mississippi District.

**COLLITZ, HERMANN** (1855- ). An American philologist (see Vol. V), professor of Germanic philology at Johns Hopkins, 1907-27. He was editor of *Hesperus: Schriften zur germanischen Philologie* after 1912 and author of *Sammlung der griechischen Dialektenschriften* (1884-1915).

**COLLOID CHEMISTRY.** See **CHEMISTRY.**

**COLLOIDS.** See **CHEMISTRY**; **BOTANY**; **SOIL.**

**COLOMBIA.** A South American republic situated in the northwestern part of the continent. Because of boundary disputes, its frontiers were not definitely delimited in 1929. Its area is variously estimated at from 435,000 to 440,846 square miles. The population at the

census of Mar. 5, 1918, was 5,855,077, of whom 153,428 were Indians. The population in 1912 was 5,072,604. The capital, Bogota, had 143,994. Other large cities with their populations were: Barranquilla, 64,543; Cartagena, 51,382; Medellin, 79,146; Cali, 45,525; Manizales, 43,203. In 1928 a law authorized the taking of a general census of the Republic. Preliminary figures gave to Bogota more than 220,000 inhabitants and indicated a population in excess of 100,000 each for Medellin, Barranquilla and Cali, and slightly below this number for Manizales and Cartagena. Cucuta, Pereira, and Bucaramanza, were estimated in excess of 40,000, and nearly 20,000 for Popayan.

**Industry and Trade.** Coffee is the principal crop and chief article of export, for Colombia ranked second only to Brazil as a coffee-producing country. The export totaled 334,412,920 pounds in 1927, value, \$79,808,000, that sold in the United States bringing \$65,585,000. The export in 1913 was 134,136,000 pounds. Bananas are the second important agricultural product, with exports in 1927 of 196,624,000 kilos, valued at \$5,587,000. In 1913, 157,385 tons were exported. Other important crops are rice, sugar, cotton, corn, tobacco, and wheat, while vegetable ivory, rubber, gums, medicinal plants, and dyewoods were important forest products. Gold mining, one of the oldest industries in Colombia, has been carried on since Spanish colonial days, and exports, which represented practically the entire production, were about \$5,000,000. The platinum mines, which furnished the greatest part of the world's supply, have an annual production worth some \$5,000,000. The emerald mines, controlled by the Government, are the largest producers in the world. The petroleum industry is still in its infancy but promises to be of increasing importance. Petroleum was first exported in 1926, and by the end of that year exports amounted to 5,000,000 barrels; in 1927 the exports were 13,679,000 barrels. The impetus given manufacturing during the War placed many small-scale industries in the towns on a stable footing and progress was made in the production of cotton textiles, shoes, cigarettes, beer, flour, soap, and matches. The making of Panama hats, a native industry requiring no machinery, prospered. The foreign trade of Colombia has grown steadily. The balance of trade has been favorable for many years, with the result that the Colombia peso, which is worth \$0.973, was in 1918 above par in New York, and in 1928 was a little above par. Exports in 1927 were valued at \$121,340,000, compared with \$33,457,370 in 1913; and imports for 1927 were \$118,894,000, compared with \$27,822,385 in 1913. The United States took, on the average, about 70 per cent of all exports and supplied some 47 per cent of all imports, so that it ranked first in Colombian foreign trade, with Great Britain second. Exports to the United States in 1927 amounted to \$91,800,000, compared with \$15,714,000 in 1913, while imports from the United States were \$51,481,102, compared with \$7,647,000 in 1913. The chief exports are coffee, gold, bananas, platinum, and hides; and the principal imports, textiles, foodstuffs, machinery, and construction material.

**Finance.** The Colombian national debt as of Dec. 31, 1926, was 23,768,000 pesos. This figure comprised 14,242,000 pesos of foreign debt, and 9,526,000 of internal debt. The budget for the year 1928 showed estimated revenues of 51,944,-

057 pesos, as against 12,043,145 pesos in 1912, and 45,158,061 pesos for expenditures, which amounted to 12,500,000 pesos in 1912. Total currency in circulation as of Dec. 31, 1927, was 46,370,000 pesos. During July, 1923, the Colombian government used the first \$5,000,000 installment of the American payments on the \$25,000,000 guaranteed under the 1921 treaty to establish a central bank of issue, modeled on the Federal Reserve Banks. This exerted a stabilizing effect on the finances and currency of the country. An American mission gave Colombia valuable assistance in its finances in 1923.

**Communications.** In 1927 there were 1438 miles of railway, compared with 620 in 1911. Construction work was done during 1923 on the Pacific railway, so that this line was complete to Zarzal, a distance of about 200 miles from the port of Buenaventura. In 1923 the Colombian Congress passed laws providing for the expenditure of the remaining \$20,000,000 of American payments on the construction of 11 railroads and other improvements.

**History.** Recent outstanding events in Colombia's history have centred in the settlement of the Panama question with the United States. After the failure of the treaty of 1909, a new pact was drawn up in 1914 which contained a plain apology, attributed to the Secretary of State at the time, William J. Bryan, for the American part in the Panama revolution; the agreement gave Colombian citizens the same rights as those of American citizens in the use of the Canal Zone and the Panama Canal, and it provided for the payment of a \$25,000,000 compensation in five equal annual installments. Colombia ratified the treaty, but the American Senate, incensed at its apologetic tone, withheld its consent until 1921, when, under the Republican administration, the objectionable phrases were withdrawn. On Nov. 5, 1921, the Colombian Senate accepted the treaty as revised, and on Mar. 2, 1922, the House of Representatives finally acceded, so that in the fall Colombia received its first payment of \$5,000,000. The remainder was paid in annual installments of \$5,000,000 each. This fund was devoted largely to the founding of a national bank and the promoting of various railway projects. From 1914 to 1918, José Vicente Concha served as President; and his Minister for Foreign Affairs, Marco Fidel Suárez was elected to the office for 1918-22. A decree issued by President Suárez nationalizing oil resources caused considerable excitement in business circles but was declared unconstitutional by the Supreme Court. President Suárez resigned in 1921 because of opposition encountered in the Congress, and a provisional president, Jorge Holguin, was appointed to fill out the term. For the years 1922-26, General Pedro Nel Ospina, Conservative, was elected.

In April, 1925, an attempted revolt against President Ospina by military leaders was frustrated when he unexpectedly returned to the capital from a tour of the country. In February, 1926, the Conservative Party candidate, Dr. Miguel Abadía Méndez, was chosen President without opposition and was inaugurated on August 7. His first cabinet resigned four months later, as a result of lack of confidence throughout the country in its competency. Colombia's foreign relations have been without special incident. The country remained neutral during the World War and joined the League of

votes; Smith, 133,131. W. H. Adams, Democrat, was reelected governor in 1928.

**Legislation.** The Legislature meets biennially. In 1915 a workman's-compensation law was passed. In 1917 a special session of the Legislature voted \$2,500,000 in war bonds. The Legislature in this year amended the liquor laws, passed a pure-food law, and amended the laws relating to elections. The Legislature of 1919 ratified the Federal Prohibition Amendment and reenacted the Workmen's Compensation Law amendments. In 1921 the Legislature referred to the electors an amendment prohibiting aliens from holding land in the State. Laws relating to corporations were amended and an inheritance-tax measure enacted. A special session of the Legislature, held in April, 1922, provided for the creation of an improvement district against which bonds were authorized for the construction of the Moffat Tunnel, a railway tunnel through the mountains near James Peak, northwest of Denver, on the line of the Denver & Salt Lake Railroad. A second act authorized the organization of a flood-control district along the Arkansas River for the protection of Pueblo and other communities. The Legislature of 1923 passed measures to compensate veterans of all wars, beginning with the Civil War, and to facilitate the coöperative marketing of agricultural products.

**COLORADO, UNIVERSITY OF.** A coeducational State institution at Boulder, Colo., founded in 1876. The student enrollment increased from 1236 in 1914 to 2990 in 1928-29; the faculty increased from 200 to 288 members in the same period; and the volumes in the library, from 100,000 to 183,175. There was also a summer-quarter registration in 1928 of 3437. The total income for general maintenance, from State fees, tuition, etc., was estimated at about \$1,195,000 in 1928, while approximately \$501,000, including fees, was received for operation of hospitals, and \$125,000 for new buildings. Twenty residence scholarships were established in 1922 and separate departments in journalism and anthropology were opened. The General Education Board gave \$700,000 to be used for the construction of a medical plant at Denver, and a yearly stipend of \$50,000 for its maintenance over a term of years; the Liberal Arts Buildings, the Macky Auditorium, a University Hospital and Medical School, the State Psychopathic Hospital and Nurses' Home, a chemistry building, an engineering laboratory, and other improvements, were added to the plant of the University during the period 1914-1928. In 1918 George Norlin, Ph.D., LL.D., succeeded Livingston Farrand, LL.D., as president.

**COLORADO COLLEGE.** A privately endowed, non-denominational liberal arts college for men and women, founded at Colorado Springs, Col., under the auspices of the Congregational Church in 1874. The student enrollment increased from 501 in 1914 to 679 in the academic year 1927-28, exclusive of music and art students, the net grand total for the latter year being 974. The enrollment in the summer session of 1928 was 167. The faculty during the period under review was increased from 51 to 63 members. The endowment was increased from \$1,042,000 to \$2,422,044 during the same years, and the annual income from \$85,165 to \$483,404; the number of volumes in the library, from 75,000 to 110,000 volumes. In November, 1928, the College received from E.

P. Shove, a member of the Board of Trustees since 1912, the gift of \$225,000 for the erection, equipment, and (if possible) maintenance of a collegiate chapel as a memorial to his clergyman ancestors of the past twelve generations, and the Trustees voted to undertake a campaign for \$300,000 to augment the general endowment funds. A new system of honors courses was inaugurated during the period, permitting of greater specialization and wider scope for individual investigation among the members of the two upper classes who had distinguished themselves in the first two years. A change in entrance requirements in September, 1927, provided for a greater freedom of choice in subject matter but a higher quality requirement, inasmuch as students must be in the upper two-thirds of their class in high school to qualify for admission. Charles Christopher Mierow, Ph.D., LL.D., a member of the faculty from 1916, became dean and acting president in the autumn of 1923, and was inaugurated as president on Dec. 5, 1925.

**COLOR-BLINDNESS.** TRANSMISSION OF. See HEREDITY.

**COLORED METHODISTS.** See METHODISTS, COLORED.

**COLUM, PADRAIC** (1881- ). An Irish American poet and dramatist, born at Longford, Ireland. One of the early leaders of the Irish literary renaissance, he soon gained prominence as editor of the *Irish Review* and a writer of charming lyrics. He came to the United States in 1914, where, in company with Ernest Boyd and others, he did much to familiarize Americans with the current trends in Irish literature. His later work has been largely concerned with the preparation of children's books, done with that meticulous care and poetic sense so conspicuous in all his writings. Among his books were: *Wild Earth* (1907); *Three Plays* (1916); *The Adventures of Odysseus* (1918); *The Golden Fleece* (1921); *The Anthology of Irish Poetry* (1921); *Castle Conquer* (a novel, 1923); two volumes of Hawaiian stories (1924-25); *The Road Round Ireland* (1926); *Creatures*, verse, (1927); and *The Fountain of Youth* (1927).

**COLUMBIA UNIVERSITY.** A non-sectarian institution of higher learning founded as King's College in 1754. The principal buildings are at Morningside Heights, New York City, and comprise Columbia College, a college of liberal arts for undergraduate men; schools of mines, engineering, chemistry, architecture, journalism, business, and library service; the non-professional graduate faculties of political science, philosophy, and pure science; Barnard College, for undergraduate women; Teachers College, including the departments of education and practical arts; and the university library. The College of Physicians and Surgeons, the medical school, formerly on West Fifty-ninth Street, and the School of Dental and Oral Surgery, are located on West 168th Street, at the Medical Centre, dedicated and opened in 1928. The College of Pharmacy is on West Sixty-eighth Street. Seth Low Junior College was opened in the Borough of Brooklyn in 1928. In the same year, St. Stephen's College, Annandale-on-Hudson, was incorporated in the University system. In addition to the regular sessions, there is a thorough system of university extension and home study, and in the summer, besides the regular summer session at Morningside Heights, a summer camp at Morris, Conn. Extramural

## COLUMBIA UNIVERSITY

*Underwood & Underwood*

### MEDICAL CENTRE, NEW YORK

To the right is the twenty-two story Presbyterian Hospital building which houses also Sloane Hospital for Women and Squier Clinic. The lower building in the right foreground is the Stephen V. Harkness Pavilion for private patients. The Babies' Hospital appears to the extreme right of the Presbyterian Hospital. The Columbia University College of Physicians and Surgeons is the high building in the background adjoining the Presbyterian. In the centre foreground is Anna C. Maxwell Hall, the residence for the Presbyterian Hospital School of Nursing. The large building to the left is the New York State Psychiatric Institute and Hospital. The Neurological Institute is between the New York State Psychiatric Institute and Maxwell Hall.

work in many subjects is conducted in various centres near New York.

The enrollment of the university grew steadily from 14,098 resident students in 1913 to 36,398 on Mar. 2, 1929 including 14,007 in the summer session of 1928, but excluding duplicates: and the number of members of the faculties was increased from 907 in the earlier year to 2714 in 1928. The library was increased during this period from 550,000 bound volumes and 75,000 German dissertations to 1,132,236 volumes. In 1928 the total endowment amounted to \$69,550,071.31 and the estimated total resources of the university, \$124,415,474.10. The annual budget for the academic year 1928-29 was set at \$13,829,105.94. An elaborate building programme was laid out in 1919, since which year to the physical equipment of the university have been added Johnson Hall, a residence for women graduate students, Russell Hall, the library and administration building for Teachers College, Hewitt Hall, a residence for undergraduate women of Barnard College, completely equipped modern physics laboratories, the Chandler Laboratories for advanced instruction and research in chemistry, John Jay Hall, a residence and dining hall for undergraduate men containing also headquarters for student activities, new buildings for the College of Physicians and Surgeons and for the School of Dental and Oral Hygiene as units in the Medical Centre, established on West 168th Street in conjunction with the Presbyterian Hospital, and the Casa Italiana, a centre of Italian culture. The University acquired a tract of more than twenty-eight acres at the northern end of Manhattan Island for an athletic field known as Baker Field, in honor of its donor, George F. Baker. Various apartment houses in the vicinity of the university for the use of officers and teachers were purchased in this period. Early in 1929, a parcel of real estate comprising almost three solid city blocks between Fifth and Sixth avenues and extending from Forty-eighth to Fifty-first streets, held at a nominal value when acquired by the university in 1814, was leased for a period of eighty-seven years at a rental reported to be approximately \$3,000,000 annually. This transaction was held to be one of the largest of its kind ever consummated in New York City and by its terms the university secured a considerable addition to its annual income.

In 1918 women were admitted as students to the medical school for the first time and in 1927, to the Law School. In 1923 the College of Dental and Oral Surgery of New York was merged with the School of Dentistry, established in 1917, and the school thus formed, known as the School of Dental and Oral Surgery of Columbia University, was moved to the Medical Centre on West 168th Street in 1928. Lincoln School was established in 1917 under the direction of Teachers College, for the purpose of scientific experimentation and constructive work in the reorganization of elementary and secondary education. In 1919 selective tests were instituted which may be substituted for entrance examinations for Columbia College, and this system has since been modified and extended for use in other schools of the university. In 1927-28 the entire curricula of the undergraduate colleges for men and women were revised so as to present to the student of today a programme truly educational in character, based upon the largest experience and the best wisdom and adapted to various

modern needs. Home-study courses carrying no academic credit were instituted in 1919 under the department of university extension. The School of Library Service, with which are absorbed and combined the former New York State Library School of Albany, New York, and the Library School maintained by the New York Public Library, was opened in 1926, thereby carrying to final consummation a plan first entered upon by the university in 1883. In co-operation with the University of Porto Rico, Columbia, in 1926, established and undertook to maintain the School of Tropical Medicine at San Juan, Porto Rico. In 1928 Seth Low Junior College was established in the Borough of Brooklyn as a development of the work of university extension and named in honor of a former Mayor of both Brooklyn and New York and a former president of the university as well; St. Stephen's College, Annandale-on-Hudson, New York, became a member of the university's educational system; and an agreement was entered into with the Union Theological Seminary by the terms of which the faculty of the Seminary becomes in effect the faculty of theology in the university's educational system. In the same year, the trustees voted an increased schedule of salaries making the minimum salary for full professorship \$7500, the increases applying to all grades of academic appointment.

The faculty of law completed in 1923 a plan for the organization of advanced instruction and research in the field of public and private law and the degree of doctor of law (Doctor Juris) to be conferred on practically the same terms as the degree of doctor of philosophy in other fields of knowledge, was established. In 1928 there was created a new academic status, that of Emeritus Professor in Residence, by the terms of which a professor of distinction may continue a limited programme of instruction and research after reaching the retiring age. President, Nicholas Murray Butler, LL.D. (Cantab.), D.Litt. (Oxon), Jur.D. (Paris). See BARNARD COLLEGE.

**COLUMBIAN SQUIRES.** See KNIGHTS OF COLUMBUS.

**COLUMBUS.** The capital of Ohio. The area of the city was increased from 14,570.2 to 15,824.5 acres by the annexation of Linden Heights Village in 1921. The population increased from 181,511 in 1910 to 237,031 in 1920, and to 299,000 in 1928, by the estimate of the Bureau of the Census. A municipal charter of the home-rule type went into effect in 1916. Since 1920 a city-planning commission has carried on an active programme, its membership consisting of the city engineer and director of public safety and various citizens, including a professor of municipal engineering, a real estate man, an architect, and a newspaper publisher.

Plans for the establishment of an elaborate civic centre along the Scioto River have resulted in the erection of a number of public buildings, including the City Hall, American Insurance Union citadel, and a high school costing \$1,000,000. Another reservoir, capable of containing 5,833,000,000 gallons, has been built, and the purification and pumping works have been enlarged. The cost of this was met by a \$3,000,000 bond issue voted in 1919. In 1921 three concrete arch bridges were opened to traffic to replace the bridges lost in the great flood of 1913. The Mound Street Bridge, 1050 feet long and supported by nine arches, was built by the

city at a cost of \$6,000,000; the others at Broad Street and at Town Street were built by Franklin County at a cost of \$600,000 apiece. An elaborate passenger air station was constructed at the Municipal Airport in 1929.

The assessed valuation of property in Columbus in 1927 was \$594,323,000; the net indebtedness was \$27,220,000. Nearly \$6,000,000 has been expended on a school-building programme. The value of manufacturing increased from \$70,000,000 in 1914 to \$178,289,061 in 1925. From 1925 to 1927, there was extensive construction of apartment houses, office and theatre buildings, factories and warehouses.

**COLVIN, kōl'vin, SIR SIDNEY** (1845-1927). An English art and book critic (see VOL. V). Besides being a member of numerous learned and art societies, he was author of *John Keats, His Life and Poetry* (1917), and *Memories and Notes* (1921). Consult *The Colvins and Their Friends*, by E. V. Lucas (1928).

**COMBES, kōrh, (JUSTIN LOUIS) ÉMILE** (1835-1921). A French statesman (see VOL. V), who was a member, without portfolio, of the Briand ministry of 1915-16.

**COMBINING WEIGHTS.** See **CHEMISTRY.**

**COMETS.** See **ASTRONOMY; PHYSICS.**

**COMFORT, WILL LEVINGTON** (1878- ). An American novelist, born at Kalamazoo, Mich., and educated in the public schools of Detroit. He served in the United States Cavalry during the Spanish-American War, and was war correspondent in the Philippines and China in 1899 and in Japan and Russia in 1904. Besides numerous contributions to periodicals, he wrote the following: *Rouledge Rides Alone* (1910); *Fate Knocks at the Door* (1912); *Down Among Men* (1913); *Midstream* (1914); *Red Fleece* (1915); *Lot & Company* (1915); *Child and Country* (1916); *The Hive* (1918); *The Shielding Wing* (1918); *Son of Power* (1920); *This Man's World* (1921); *The Public Square* (1923); *Somewhere South in Sonora* (1925); and *Samadhi* (1927).

**COMMUNISM.** As the type of socialist doctrine which, on the basis of the Marxian Communist Manifesto, strives for the attainment of the socialist aim by means of the dictatorship of the proletariat, communism is a recent development and quite different from the earlier interpretation. While the communists believe, like the socialists, in collective ownership of the means of production, they are unalterably opposed to any temporizing and to any coöperation toward this end with the bourgeois parties. The communists believe that the revolutionary working classes must seize the power and set up a dictatorship of the proletariat in preparation for the socialist state. This does not mean, however, that the communists reject democracy as such, but they hold that, during the period of transition, until the socialist state is achieved, majority rule is unfeasible and the struggle must be carried on by a class-conscious minority.

Modern communism is distinctly a fruit of the Russian Bolshevik Revolution of November,

1917. Previous to the War, two socialist groups, differing in aim and procedure, existed in Russia. The first group, the Revolutionary Socialists, regarded Russia as an agricultural country whose economic development must necessarily be different from that of western Europe. The second group, the Social Democratic Party, stood squarely on the basis of the Marxian doctrine of the class struggle and held that Russia must first go through the industrial and capitalistic stage in order to attain the socialist ideal. It was this group, or rather its majority element, the Bolsheviks, who through their majorities in the Workmen's and Soldiers' Councils seized the power in Russia in November, 1917, organized the communist state, and elaborated the communist doctrine. They set up a dictatorship of the proletariat—that is, of the communists—and suppressed all elements opposed to their rule. They had no illusions as to the advisability of applying their principles of liberty and democracy to existing conditions. In their opinion, Russia was in a state of transition during which all opposition had to be wiped out ruthlessly and preparations had to be made to bring about the socialist state. The executive power of the Russian communist state was in the hands of the Board of People's Commissaries, which derived its authority from the All-Russian Congress of Soviets, the members of which were communists, with very few exceptions. The Communist Party in Russia, which wielded absolute power, seldom exceeded a membership of 700,000. It was the agency through which the Government kept in contact with the trade unions and all other organizations.

Under the auspices of the Soviet government, the Third or Communist International was organized in March, 1919, at Moscow. It was headed by Gregory Zinovieff, who was responsible for a persistent propaganda being carried on in Great Britain, Germany, and France. The so-called Zinovieff letters played a prominent part in the British election campaign of 1924 and helped in the defeat of the Labor government. Zinovieff resigned in October, 1926, his decline being synonymous with the ousting of Trotsky and Kameneff from the political bureau of the Russian Communist Party. He was succeeded by Bucharin, under whom the international activities of the party were permitted to languish as a result of the opportunist tactics of the Stalinists. Bucharin, too, resigned in March, 1929, and appeared to ally himself with the Trotskyists, who by this time included such other brilliant party leaders as Radek, Rakowski, Smilga, etc. The peak of the Third International was reached at the fifth congress of the body, when 500 delegates from 60 countries assembled in Moscow (1924).

The radical dissenting elements of the American Socialist Party established the American Communist Party in September, 1919. A day later, the Communist Labor Party was founded by John Reed. The differences between the two groups were slight and a section of the Communist Party united in 1920 with the Communist Labor Party to form the United Communist Party. The American Government took strong action against the communists and the result was that the movement was driven underground. The Workers' Party was formed in December, 1921, but was compelled to exist secretly as a result of the attitude of the Federal and State governments. In the national election of 1924,

the Workers' Party polled 36,386 votes. The Workers' Party, in the election of 1928, nominated William Z. Foster and Benjamin Gitlow and issued a manifesto in which it called for the establishment of a workers' and farmers' government and a communist society in which the "means of production will not be the property of the few." Its candidates received 48,228 votes. In certain trade unions, the communists played significant rôles, their struggle with the Rights succeeding in disrupting the ladies' dress and fur industries in New York City, for example. Toward the close of the period under review, communists in trade unions gave up their tactics of boring from within and formed parallel unions; thus sapping the strength of the conservative trade-union organizations. In 1929 the party's internal organization was split asunder by the Stalin-Trotsky conflict. In France, Germany, and, to a lesser extent, in Great Britain, the communist groups were active. See RUSSIA; SOCIALISM.

**COMSTOCK, ADA LOUISE (1876- ).** An American educator and college president, born in Moorhead, Minn. She studied at the University of Pennsylvania and Smith College and took postgraduate courses at Columbia, Mt. Holyoke, and the University of Michigan. She served on the faculty of the University of Minnesota as professor and dean of women until 1912, when she was appointed dean of Smith College. After eleven years there, she became president of Radcliffe College (1923). In 1928 President Hoover appointed her as the only woman member of his National Law Enforcement Commission.

**COMSTOCK, F. RAY (1880- ).** An American theatrical producer born in Buffalo, N. Y., who began as a producer for the theatre in 1900 and has been best known for his productions of *Very Good, Eddie*; *Oh, Boy!*; *Oh, Lady, Lady*; *Oh, My Dear*; *Chu Chin Chow*; and *Mecca*. He brought to the United States Balieff's *Ohave-Souris* and presented Madame Eleanor Duse for her last American tour.

**COMSTOCK, HARRIET THERESA (1860- ).** An American author, born at Nichols, N. Y. She was educated at an academy in Plainfield, N. J. In 1885 she was married to Philip Comstock, of Brooklyn. Her books, mostly for children, had a very wide sale. They include: *Molly, the Drummer Boy* (1900); *A Boy of a Thousand Years Ago* (1902); *Janet of the Dunes* (novel; 1908); *Joyce of the North Woods* (1911); *A Son of the Hills* (1913); *The Place Beyond the Winds* (1914); *The Vindication* (1917); *Mam'selle Jo: A Novel of the St. Lawrence Country* (1918); *Unbroken Lines* (1919); *The Shield of Silence* (1921); *At the Crossroads* (1922) and *The Tenth Woman* (1923).

**CONANT, JAMES BRYANT (1893- ).** An American chemist, born at Boston, Mass., and educated at Roxbury Latin School and Harvard (A.B., 1914; Ph.D., 1916). After a year as instructor in chemistry at Harvard, he became a major in the research division of the Chemical Warfare Service during the World War. Returning to Harvard in 1919, he was successively assistant professor, associate professor, and professor of chemistry (1919-29). In 1929 he became Sheldon Emery Professor of organic chemistry. In the same year, he was elected to the National Academy of Sciences. He is the author of *Organic Chemistry* (1928).

**CONCRETE.** See CEMENT; ROADS AND PAVEMENTS.

**CONE, HUTCHINSON INGHAM (1871- ).** An American naval officer (see Vol. V). He commanded the United States Naval Aviation Forces from August, 1917, to October, 1918, and was wounded when his ship was sunk in the Irish Sea by a German submarine in 1918. He received many foreign decorations and the Distinguished Service Medal of the United States Navy. He was retired in 1922. He served as general manager of the U. S. Shipping Board Emergency Fleet Corporation (resigned 1925).

**CONFLAGRATIONS.** See FIRE PROTECTION.

**CONGER, SEYMOUR BEACH (1876- ).** An American newspaper writer, born at Port Huron, Mich. He graduated from the University of Michigan in 1900, served on the staff of several papers in Michigan and after 1903 served the Associated Press as correspondent in St. Petersburg during the revolution of 1905 and the Russo-Japanese War, director of the Berlin bureau from 1910 to 1917, and war correspondent with the German and Austro-Hungarian forces until the United States entered the World War. He represented the Associated Press at the Peace Conference at Paris. In 1918 he was foreign adviser to the War Trade Board in Washington, and acted as chief correspondent of the *Public Ledger*, Philadelphia, in central and eastern Europe, 1920-25. During the Spanish-American War, he served as private in the 32d Michigan Infantry.

**CONGO, BELGIAN.** A Belgian colony of central Africa, with an estimated area in 1928 of 918,000 square miles, and a native population estimated at 8,500,000 to 11,000,000. The white population on Jan. 1, 1927, numbered 18,169. Of the population of 1927, 11,898 were Belgians; 844, English; 443, Americans; 1368, Portuguese; and 981, Italians. The leading cities were Boma, the capital, Matadi, Banana, Leopoldville, Stanley Pool, and Elizabethville.

**Industry and Trade.** The rubber industry has steadily dropped in importance. In 1926 only 1,128,818 kilos were exported, as compared with 3,401,970 kilos in 1911. On the other hand, the palm-oil industry, exploited by British capital, has made steady advances, so that by 1926 the export of palm nuts was 70,424,630 kilos (5,573,630 in 1910), and of palm oil, 18,447,270 kilos (1,963,637 in 1910). With the fall in rubber, attention was turned to the cultivation of cotton, cocoa, rice, and copal, whose export in 1911 amounted to 1,944,455 kilos. In 1926 this export amounted to 20,866,410 kilos. The development of the copper mines, too, increased enormously under the British penetration into Katanga. (See COPPER.) Furnaces were built

for the smelting of the ore for shipment to the United Kingdom. In 1911 the shipment was about 909,090 kilos; by 1926 it had reached 78,983,310. Gold, diamonds, and ivory are other important products. Exports, both general and special, were valued at 142,590,000 francs in 1912; in 1926 they were valued at 729,301,977 francs. Copper, palm nuts, and oil were particularly important. Belgium, of course, absorbed most of the trade. Leading imports were cotton, provisions, machinery, spirits, ships, and arms. Imports in 1913 were worth 71,590,781 francs; in 1926, 1,293,197,242 francs. The United States imports were put at 76,451,822 francs, a tremendous increase over the 74,525 francs of 1913. By Jan. 1, 1927, the total length of railways had increased to 1623 miles. The most important project begun in 1921 was a line from Chilongo in the Katanga to Angola, 400 miles, to be linked eventually with the line to Lobito Bay on the Atlantic Ocean. This would give the Katanga mines direct connection with European markets. In 1911 a pipe line was laid from Matadi to Leopoldville for the purpose of transporting crude oil for the use of river steamers. In 1927 there were 2167 miles of telegraph line, about twice as much as in 1912 (1145 miles), and 17 wireless stations (5 in 1912).

**Finance.** The 1928 budget provided for receipts of 521,563,585 francs, against 40,418,100 for 1913; 1928 expenditures were placed at 521,241,955 francs, against 50,933,064 for 1913. The public debt in 1928 was 1,893,050,983 francs. Expenditures usually exceed receipts, with the result that the deficit steadily mounts and loans have to be made for its service.

**History.** Natives were employed in the fighting in East Africa and aided in the subjection of German East Africa. At the conclusion of the War, Belgium was given the districts of Ruanda and Urundi, formerly belonging to German East Africa, and the territory around Lake Kivu necessary to make it Belgian. All in all, 19,000 square miles were added to the Congo's territory. To facilitate the construction of the Cape to Cairo railway and more particularly a line from the Tanganyika Territory to Uganda, Belgium turned over to Great Britain portions of this new territory.

**CONGREGATIONALISM.** Congregationalism traces its origin to the Separatist and Puritan developments of the Reformation in England. Its policy represents adaptation to conditions rather than accord to a theory of church government. The local church is the unit and every church member has an equal voice in its conduct and is equally subject to its control. The membership increased from 750,193 in 1914 to 928,558 on Jan. 1, 1928, and the number of Sunday-school pupils from 701,460 to 742,270; the number of churches, on the other hand, decreased from 6006 to 5548 and the number of ministers from 6066 to 5609. In October, 1923, the National Council, the representative body of the denomination, approved the proposals of the Interchurch Conference on Organic Union, that as soon as at least six denominations agreed, they should merge under the name of the United Churches of Christ in America. The plan grew out of overtures made by the General Assembly of the Presbyterian Church in the United States of America in 1918 and was referred in 1921 to State conferences and district associations for action. The National Council

in 1923 also expressed its willingness to confer with the Presbyterian Church with a view to merging. In 1929 the National Council meeting at Detroit voted for an organic union with the Christian Church. A five-year tercentenary campaign in celebration of the anniversary of the landing of the Pilgrim Fathers was carried on in 1915-20, one item of which was the subscribing of \$5,000,000 as an endowment of a pension system for ministers, and in June, 1928, a group of 1200 Congregationalists from England made a pilgrimage to Boston and Plymouth Rock and visited Providence, New Bedford, and other New England cities, as well as New York and Brooklyn, before their return to England. On Jan. 1, 1928, the denomination was maintaining 17 missions under 12 flags, 98 stations in connection with these missions and 1,665 outstations. Statistics of the American Missionary Association showed 236 churches with 11,254 members, and 32 schools with 7,472 pupils. The denomination had affiliations with 10 theological seminaries and 41 colleges, although some of the latter were undenominational.

**CONGREGATIONAL METHODISTS.** This branch of the Methodist Church was organized in Georgia in 1872 as a protest against certain features of the episcopacy and the itinerancy, and for the purpose of securing a more democratic form of church government. In 1881 a small group of Southern churches divided from the main body to form the New Congregational Methodist Church; by 1928 they had 25 churches, with 1229 members. The churches of the Congregational Methodists in 1916 numbered 197, with a membership of 12,503, and 250 ministers. The denomination in 1928 had 145 churches, with 9691 members, and 125 ministers. The total enrollment of the 80 Sunday schools was 4807.

**CONKLING, GRACE WALCOTT HAZARD** (?- ). American author, born in New York City and educated at Smith College and in Europe. In 1914 she went to Smith to teach English, becoming associate professor. Her collected volumes of verse included *Afternoons of April* (1915); *Wilderness Songs* (1920); *Ship's Log and Other Poems* (1924); and *Flying Fish—a Book of Songs and Sonnets* (1926). In the period she attracted wide attention as the teacher of her little daughter, Hilda Conkling, whose *Poems by a Little Girl* (1920) displayed great ability.

**CONNAUGHT, kōn'nat, ARTHUR WILLIAM PATRICK ALBERT, DUKE OF** (1850- ). English statesman (see VOL. V). In 1916 he retired from his position as Governor General of Canada, and in 1920 went to India to represent the King of England in the inauguration of the legislative councils of Madras, Bengal, and Bombay. His only son, Prince Arthur of Connaught, who was educated for the British Army and served at the front during the World War, was Governor General of the Union of South Africa, 1920-23.

**CONNECTICUT.** The forty-sixth State of the United States in size (4965 square miles) and the twenty-ninth in population; capital, Hartford. The population of the State increased from 1,114,756 in 1910 to 1,380,631 in 1920, or by 23.9 per cent; estimated population, 1928, 1,667,000. The white population increased from 1,098,897 (1910) to 1,358,732 (1920); Negro, from 15,174 to 21,046; native white, from 770,138 to 982,219; foreign-born white, from 328,759 to 376,513; The urban population rose from

731,797 in 1910 to 936,339 in 1920; the rural, from 382,059 to 444,292. The growth of the principal cities was New Haven (q.v.), 133,605 to 162,537; Bridgeport (q.v.), 102,054 to 143,555; Hartford (q.v.), 98,915 to 138,036.

**Agriculture.** While the population of the State has increased by reason of large urban growth, the percentage of rural population declined from 40.1 in 1900 and 34.4 in 1910, to 32.2 in 1920. Thereafter, the total area in farms decreased slightly from 1,898,980 acres in 1920 to 1,832,110 in 1925; the number of farms, however, rose slightly from 22,655 to 23,440; the improved land in farms was 701,086 acres in 1920. The total value of farm property which had increased from \$159,399,771 in 1910 to \$226,991,617 in 1920 rose somewhat further to \$230,828,891 in 1925, but the average value per farm, having risen from \$5944 in 1910 to \$10,019 in 1920, fell to \$9032 in 1925. In interpreting these and all other comparative values for the period covered, the nationwide inflation and deflation of prices must be considered. The total percentage of land in Connecticut used for agricultural purposes in 1920 was 61.0, and decreased to 59.4 in 1925. The percentage of improved land in farms decreased from 32 to 22.7 between 1910 and 1920. Of the 22,655 farmers of 1920, 14,955 were native white, as compared with 19,841 in 1910; foreign-born white, 7625, as compared with 6861; colored, 75, as compared with 113. Of the total number of farms, 23,240 in 1925, 21,258 were operated by their owners, as compared with 19,666 in 1920; managers operated 1070 farms in 1920 and 494 in 1925; tenants operated 1919 farms in 1920, 1488 in 1925. Farms reported by operator owners as mortgaged numbered 8920 in 1920, and 9197 in 1925. The number of all cattle on farms in 1920 was 173,764; in 1925, 152,864. The number of sheep decreased from 10,842 to 6941. Tobacco growing underwent an extensive and fairly continuous decline for several years after 1920. The estimated production of the chief farm crops in 1927 was as follows: corn, 2,090,000 bushels; oats, 480,000; potatoes, 1,035,000 bushels; hay, 538,000 tons; and tobacco, 28,886,000 pounds. Comparative figures for 1913 are corn, 2,348,000 bushels; oats, 308,000; potatoes, 2,208,000 bushels; hay, 432,000 tons; and tobacco, 28,520,000 pounds.

**Mining.** Connecticut is not an important mineral-producing State, and its mineral products in the decade were chiefly nonmetallic. In order of importance, they were clay products, stone, lime, sand, and gravel. The value of the clay products was \$1,229,037 in 1914; in 1920, \$3,255,295; and in 1921, \$1,703,528. In 1920 the year's output of clay products was \$3,291,298. The annual value of the stone production was approximately \$2,500,000. The total value of the mineral products of the State was \$3,023,192 in 1914; \$6,326,326 in 1920; \$4,219,457 in 1921; \$7,695,341 in 1926.

**Manufactures.** Connecticut is one of the most important manufacturing States. In 1920, 18 of its cities had more than 10,000 inhabitants, with a combined population of 865,943, or 62.7 per cent of the population of the State. In 1919, 71 per cent of the value of the State's manufactured products was reported from these cities. The number of manufacturing establishments in 1927 was 2877; in 1914, 4104; in 1919, 4872; and in 1925, 3062. Wage earners engaged in manufactories numbered: 1927, 240,-

806; 1914, 226,264; 1919, 292,672; 1925, 242,362. The capital invested in 1914 was \$620,194,294, and in 1919, \$1,232,324,318. The value of the products was \$1,284,738,563 for 1927; \$545,471,517 for 1914; \$1,392,431,620 for 1919; and \$1,271,932,562 for 1925; the increase from 1914 to 1919 was largely due to changes in industrial conditions brought about by the World War, and cannot properly be used to measure the normal growth of manufactures during the period. The increase in the number of wage earners indicates a decided growth of the manufacturing activities of the State. Foundry and machine-shop products rank high in their value which in 1925 was \$83,721,957; in 1914, \$67,009,000; and in 1919, \$203,626,000. Industries relating to the manufacture of brass, bronze, and copper products rose to first place, with products valued at \$156,141,974 in 1925; in 1914, \$69,353,000, and in 1919, \$169,550,000. In the manufacture of textiles, Connecticut is one of the most important States; in recent years, it ranked first in the fur-felt hat industry, fourth in silk, sixth in manufactured cotton, and sixth in the combined woolen and worsted-goods industry. The value of cotton-goods production in 1909 was \$24,232,000; in 1914, \$30,809,000; and in 1919, \$105,054,000. The silk-goods production was valued at \$21,063,000 in 1909; \$30,592,000 in 1914; and \$68,053,000 in 1919. The value of woolen products fell from \$19,363,228 in 1909 to \$17,128,975 in 1914; in 1919 it had risen to \$53,814,059. The most important manufacturing cities in the State are Bridgeport, Hartford, New Britain, New Haven, and Waterbury. Bridgeport had 367 establishments in 1909; 405 in 1914; and 443 in 1919; with products valued at \$85,126,000 for 1914; \$208,090,000 for 1919; and \$149,098,000 for 1925. In Waterbury, 169 establishments in 1909, 190 in 1914, and 253 in 1919, had products valued at \$50,350,000, \$50,659,000, and \$130,193,000, respectively. New Haven had 588 establishments in 1909, 538 in 1914, and 769 in 1919; the production attained the value of \$57,752,000 in 1914; \$125,456,000 in 1919; and \$110,506,000 in 1925. In Hartford, which had 396 establishments in 1909, 380 in 1914, and 504 in 1919, the value of local products was \$42,831,000 in 1914, \$118,003,000 in 1919, and \$109,678,000 in 1925. New Britain counted 111 establishments in 1909, with products valued at \$22,021,000; 1914, 120, with \$23,227,000; and in 1919, 116, with \$63,622,000. Other important manufacturing cities are Ansonia, Bristol, Danbury, Meriden, Middletown, New London, Norwalk, Torrington, Stamford, and Willimantic.

**Education.** Legislation in 1913 provided for the codification of the school laws and for vocational guidance in schools. In 1917 an agreement was made under the Smith-Hughes Act, for Federal assistance in vocational education. A measure passed in 1921 provided for a division of physical education and health; another bill created a division of special educational standards. In 1923 provision was made for State aid for the transportation of elementary school pupils and for the penalizing of any town which unduly delays in providing adequate school facilities. The department of Americanization, established in 1919, was changed to the Division of Adult Education. The enrollment in the public schools in 1925-26 was 320,463; the average attendance, 265,807; the enrollment had

been, in 1921-22, 279,043 and attendance 229,689. Enrollment in the elementary schools was 279,106 in 1925-26, and in high schools, 41,357. The total expenditure for public day schools in 1925-26 was: current, \$24,988,651; outlays, \$7,777,076. The percentage of illiteracy in the State increased from 7.2 per cent in 1910 to 7.8 per cent in 1920. Among those of native white parentage, it decreased from 0.6 per cent in 1910 to 0.4 per cent in 1920, and among the Negroes, from 7.8 to 7.5 per cent. Among foreign-born whites, it increased from 16 to 18.1 per cent.

**Finance.** State expenditures in the year ending June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$20,100,613 (of which \$1,581,491 was for local education); for running public-service enterprises, \$81,800; for interest on debt, \$656,865; for permanent improvements, \$9,050,580; total, \$29,880,918 (of which \$11,891,370 was for highways, \$4,101,020 being for maintenance and \$7,790,350 for construction). Revenues were \$32,658,116. Of these, property and special taxes formed 25.2 per cent; departmental earnings and remuneration for officers' services, 9.8 per cent; license sales and gasoline taxation, 54.0 per cent. Property valuation was \$2,554,603,534; State taxes thereon were \$1,812,953. Net State funded debt on June 30, 1927, was \$3,078,148.

**Political and Other Events.** In 1914 Marcus H. Holcomb, Republican, was elected governor. Senator Brandegee was reelected over Gov. Simon E. Baldwin. Governor Holcomb was reelected in 1916, and George P. McLean was reelected senator. In the presidential election in 1916, Charles E. Hughes received 106,514 votes; President Wilson, 99,786 votes. In 1917 and the years following, the great industrial cities of the State prospered because of activities following the entrance of the United States into the War. Manufactories were made over for war uses and others built. At the end of 1917, the State had about 9000 men in camp under the selective draft law and about 4000 volunteers. In 1918 Governor Holcomb was again elected. The total number of men drafted in the Federal service, 1917-18, was 23,533, with a total of 54,123 in the Army and Navy for the State. In 1920 Everett J. Lake was elected governor, and Senator Brandegee was reelected. For President, the State gave Warren G. Harding 229,238 votes and James M. Cox 120,721. In 1922 Charles A. Templeton, Republican, was elected governor and Senator McLean was reelected. In the presidential election of 1924, the State voted: Coolidge, 246,322; Davis, 110,184; LaFollette, 42,416. Professor Hiram Bingham of Yale, Republican, was elected governor, but resigned office in 1925 after serving one day, having been made Senator in the meantime by special election following the death of Brandegee. In 1925 were created the State Water Commission and the Commissioner of Aviation. John H. Trumbull, lieutenant governor, succeeded Governor Bingham, and was reelected in 1926. A Board of Finance and Control was created in 1927 to correlate State expenditure and budget making. Hoover, for President, received 296,614 votes in 1928; Smith, 252,040.

**Legislation.** In 1915 the budget system was adopted and the State's financial policy revamped to provide a pay-as-you-go policy. In

1915 the Woman Suffrage Amendment was rejected by the Legislature, but the State after steadfastly opposing it, suddenly ratified in 1920, when doubt about Tennessee's ratification seemed likely to threaten the validity of the forthcoming presidential election. Demand for a soldiers' bonus resulted in the establishment of a \$2,500,000 State fund, the income to be paid to an ex-service men's organization, for the aid of needy veterans or their dependents. In 1921 a child-welfare bureau and a juvenile-court system were established; a uniform system of accounting for all State departments and institutions was set up, and persons accused of crimes received option whether to be tried by the court or by jury. In 1923 the Legislature passed a bill to facilitate coöperative marketing of agricultural products and amendments were made to the income-tax laws. A constitutional amendment adopted in 1924 allowed the governor to veto single items in appropriation bills.

**CONNELLEY, WILLIAM ELSEY** (1855- ). An American author (see VOL. V). His recent works include *History of Kansas* (5 vols., 1917), and *History of Kentucky* (5 vols., 1922).

**CONNELLY, MARC** (MARCUS COOK) (1890- ). An American playwright born at McKeesport, Pa. He began his writing as a reporter for the *Pittsburg Sun*. He has contributed verse and articles to *Life*, *Everybody's*, and other magazines and has written lyrics for several musical comedies including: *Dulcy*; *To the Ladies*; *Little Old Millersville* (in collaboration with G. S. Kaufmann, 1921-22); *The Beggar on Horseback* (with Kaufmann, 1923), founded on P. Appel's *Hans Sonnenstösers Höllenfahrt*; and *The Butter and Egg Man* (1926).

**CONNOR, RALPH.** See GORDON, CHARLES WILLIAM.

**CONNOR, WILLIAM DURWARD** (1874- ). An American soldier, born at Beloit, Wis. Graduated from the United State Military Academy in 1897, he rose through the ranks from second lieutenant to major general (1925). He served in the Philippines in 1898 and for several years following was engaged in engineering capacities, serving also with the General Staff from 1912 to 1916. In 1917 he served with the A. E. F. as assistant chief of staff. He was appointed chief of staff of the 32d Division in 1918, and in the same year commanded the 63d Infantry Brigade of that division. In 1918-19 he was chief of staff of the Service of Supply, and was commanding general of the American forces in France to Jan. 7, 1919. In 1921 he was chief of the Transportation Service and in the same year acted as assistant chief of staff. He received decorations and honors from the British and French governments. He commanded the U. S. Army forces in China, 1923-26. In 1926-27 he commanded the 2d Division. Since 1927 he has been commandant of the Army War College at Washington, D. C.

**CONRAD, JOSEPH** (1857-1924). An English novelist (see VOL. V). In 1924 he made a visit to the United States. The later works by Conrad include *Within the Tides* (1915); *Victory* (1915); *The Shadow-Line* (1917); *The Arrow of Gold* (1919); *Rescue* (1920); *Notes on Life and Letters* (1921); *The Rover* (1923); *Under Western Eyes* (1923); *The Shorter Tales of Joseph Conrad* (1924); *Suspense* (an unfinished novel, 1925); *Last Essays* (1926), and *The Sisters* (another unfinished novel, 1928). There has been published a great deal of litera-

ture about Conrad: including a *Life of Conrad* by Ford Madox Ford (1924); *Joseph Conrad: Life and Letters*, by G. Jean-Aubry (2 vols., 1927); *Letters from Joseph Conrad, 1895-1924*, edited with an introduction and notes by Edward Garnett (1928); *Letters of Joseph Conrad to Richard Curle*, edited by Richard Curle (1928); and *The Last Twelve Years of Joseph Conrad*, by Richard Curle (1928).

**CONSCIOUSNESS AND THE UNCONSCIOUS.** The conception of consciousness was revolutionized in the period since 1914 by the action of two antithetical extremist movements. These movements were behaviorism and the new psychology centring around psychoanalysis and clinical investigations of abnormal psychology. The theoretical principles in the name of which they took the field against the old-fashioned structural psychology were diametrically opposed, but the new schools were at one in their dissatisfaction with experimental introspection as a method for dealing with the practical problems of psychology.

The systematic position of structural psychology was expressed in the doctrine of psychophysical parallelism; this doctrine not only gave a certain theoretical clearness to the problems of psychology, but what is more important, it lent itself to a vast experimental programme. Psychical phenomena were regarded not as in any sense caused by physical or physiological phenomena but as running parallel with the lower series. The hypothesis of parallelism dates back to the seventeenth century, when it was used as a metaphysical theory to explain the entire structure of the universe. In its modern form, the hypothesis was less pretentious. It took psychological and physical experience at their common-sense face value and postulated as a method of investigation and comparison the non-interaction of the two series. In order to compare consciousness with physiology, it was necessary to analyze its structure. This was done by the method of introspection; in opposition, that is, to the method of logical reflection 'under which philosophers down to Kant had decomposed the mind into abstract categories or faculties. The analysis of consciousness was carried on under experimentally controlled external conditions, and in this manner consciousness was first decomposed into sensations as elements, and when this theory proved untenable, into attributes as the fundamental units. These attributes, such as extensity, duration, clearness, quality, and intensity, were aspects of conscious life corresponding to specific alterations of physical or physiological conditions. By the method of controlled introspection experimental psychology was designed to avoid the Scylla of the subjective faculty psychology and the Charybdis of materialistic mechanism; but in the view of its opponents, structuralism sinned in both directions. In actual practice, the theory of psycho-physical parallelism was held to approach more and more the doctrine known as epiphenomenalism, according to which consciousness was only a phosphorescence peculiar to the biological behavior of the neuron particles. Structuralism certainly failed to satisfy the common-sense belief in the efficacy of mind on the material world. On the other hand, its preoccupation with defining mental life in terms of a logical system drew on it the wrath of those who were growing impatient at the failure of psychology to become a science like other sciences.

Add to this the failure to deal adequately with perception and with the higher thought processes, and its rather uncertain stand in the case of instincts and the general substratum of our conscious life, and we are in a fair way to appreciate the significance of the revolt against structuralism as a psychological doctrine.

If one should employ a metaphor drawn from politics, the revolt of behaviorism might be characterized as a revolt from the left; that is, in the direction of more mechanical objectivity. The revolt of the psychoanalytic movement would then be a push from the right. Behaviorism (q.v.) developed out of the objective methods of animal psychology and biology and in theory sought to abolish consciousness as anything but a functional relation of physiological reflexes. It achieved thereby unity of method, but only at the expense of ruthlessly exterminating the chiaroscuro of mental life. Behaviorism, whatever its significance in psychological experimentation, marked a return to the metaphysics of the man-machine with the addition of the notion of the conditioned reflex. It is this conditioned reflex, the phenomenon that we observe so frequently in gymnastic training, that is the unconscious saving grace of behaviorism, for willy-nilly it imprints into the rigid materialistic mechanism the principle of contingency. Several attempts have been made to combine behaviorism with a realistic metaphysic for the evident purpose of eliminating consciousness as a directing principle in the universal drama. Typical of these are the works of E. B. Holt (*The Concept of Consciousness*, 1914 and *The Freudian Wish*, 1915) and articles by Prof. R. B. Perry. On the other hand the English Neo-Realist, Prof. S. Alexander, while postulating a general monistic position, yet refuses to reduce the quality of consciousness to any of the lower levels of existence. To him, it is a quality over and above the nervous system in much the same manner that life is something beyond the physico-chemical reactions of the living plant or animal.

The line between the scientific aspects of the problem of consciousness and the radiating metaphysical speculations is always difficult to draw, and it is still more difficult to maintain in the concept of the unconscious. The importance of this notion has arisen from its growing use in clinical psychiatry, where it serves to explain and to link together facts which cannot be organized on the old hypothesis of parallelism. The unconscious might have remained merely a romantic idea dear to the metaphysicians of Schopenhauerian descent had not the French school and the psychoanalytic group developed it into a systematic theory of neuroses and psychoneuroses. It is in vain, therefore, that Knight Dunlap protested (*Mysticism, Freudianism and Scientific Psychology*, 1920) against the unscientific nature of the new movement. The theory of the unconscious is much less rigorous than the theories employed in the physiological branch of psychology, and it is moreover based on a different method of approach and different type of word symbols; hence arise problems of liaison between the so-called old and new psychology. But withal, the Freudian theory of the unconscious, despite its admitted lack of rigor and its tendency to degrade into extravaganzas, is preferable to a refusal to organize the phenomena of abnormal psychology at all.

In brief, what is postulated by the theory of the unconscious is a hierarchic continuity of psychic life extending indefinitely back into the history of the individual, the history of the race, and ultimately into the history of life itself. Whereas we ordinarily explain conscious experience by the presence of physical stimuli outside the body, the theory of the unconscious explains a great part of conscious phenomena, particularly those which are not explained by the first method, by past history. In dream life, very little correlation can be traced between the mental phenomena and the physical stimuli affecting the person; much more interesting correlations can be obtained between the events of a dream and the past history, or even the future, of the individual. For an opposing view, consult L. H. Horton, *The Dream Problem* (1925). Even in normal consciousness, there appears to be much more in the mind than the stimulus which has given rise to the sensory experience, and the residue is generally explained on the basis of memory. The parallelistic hypothesis is unable to account for the impulse to action save by the intervention of a new mechanism, from which consciousness is excluded, the mechanism of reflexes, instincts, and habits. The theory of the unconscious is an effort to unify the three schemas of sensory perception, memory, and instinctive response into a single chain. What we regard as full or clear consciousness is merely the end product of a historical evolution. As an end product, it contains the cumulative story of the past, a story which can be recovered by the proper analytic method.

The method of analysis parallels the comparative method of biology in searching for vestigial traces. Obviously, it cannot be mere external observation by the microscope and the scalpel, since that form of observation is insufficient to detect even the grosser biological evolution. The analysis has to be within consciousness, or within the lower levels of consciousness manifested in hypnosis or in dreams, and when this is insufficient, selected facts from the history of the individual are introduced. The event of breaking a leg is not generally of much importance to the subsequent morale of the individual, but a childhood fear, long since forgotten, may be the missing link which accounts for a present psychological condition. The daring genius of Freud has consisted very largely in seizing on certain facts as significant which to other observers seemed irrelevant. Prof. Pierre Janet in recent years elaborated a theory of various levels of psychological tension, according to which there are stable gradations of plateaus in the continuity from psychological automatism to the highest levels of reflective conscious activity. These levels are interestingly correlated with the physical metabolism of the organism. Thus, the execution of a conscious and deliberate act was found to demand a greater expenditure of physical energy than the same act executed as a reflex. This theory serves also to make more understandable not only the phenomena of sleep and hypnosis but the fluctuations in the behavior of psychopathological cases.

Another ramification in the theory of the unconscious is the problem of multiple personalities. The clinical evidence on this subject shows all gradations from what might be regarded as metaphorical divisions of personality to genuine cleavages in conscious activity. Im-

pressed by these phenomena, Dr. Morton Prince and Prof. William McDougall have fought for a recognition of pluralism. Professor McDougall's method of meeting the problem is through a revision of the Leibnizian monadology. From the point of view of positive science, this problem, in reality the metaphysical problem of the one and the many, is quite irrelevant. Whether the individual be regarded as a distinct consciousness or as a collection of conscious instincts, or monads, it is evident that here is no escape from the paradox of unity and diversity. In cases of multiple personality, it is the type of unity and the type of diversity which differ from those to be found in a normal conscious personality with multiple interests. The relation of consciousness and the unconscious to the instincts or heredity tendencies is equally a problem of the one and the many. Freudian psychologists often identify the unconscious with the sex instinct and, at other times, they speak of the sex instinct as an instinct among other instincts. At other times, they split the unconscious into two warring entities. These ambiguities are practically unavoidable in the attempt to give dialectic movement to the life of the psyche. The physical instinct of sex, because it is in the generality of men the strongest of the discrete physical urges, as well as the most mysterious, has very frequently been employed as a symbol for the entire drive of life. Plato's Eros is an instance in point. But the symbol qua symbol of an underlying reality cannot be confounded with the symbol qua independent entity. The whole theory of sublimation hinges on the distinction between symbol and reality; for it is not sex, regarded as a discreet instinct, that is sublimated into intellectual or artistic activity; it is rather the *élan vital* expressed in the sex instinct which has found new channels. Yet from a phenomenological view it would seem as if there were a real conversion or substitution.

From the foregoing discussion it is evident that the representative theory of consciousness, according to which the mind carried a point-to-point image of a physical reality, must now be regarded as obsolete. If our psychological life is made up of images, then our physical experience too is made up of images or symbols. The latter symbols or images are more stable and conventional than the so-called fainter images of the subjective consciousness, but they are not different in kind. If consciousness be regarded as the phenomenon of knowledge or intelligible awareness, it follows that we never escape that phenomenon in all human experience. But if consciousness be employed in another sense to denote the subjective level of experience, then the phenomena of consciousness form a distinct subject matter of science, a subject matter paralleling biology but not reducible to it. And this science has now been organized by means of the unconscious as a concept of continuity. The unconscious must not be hypostasized into an entity, for like the concept of an imaginary number in mathematics, it makes trouble when it is set up against concrete physical experience, although it remains perfectly intelligible in its scientific setting.

It is useful for many purposes to correlate one level of experience with another and, in this respect, there will always be room for a science of physiological psychology which uses the method of controlled introspection. This science is an-

alogous to the sciences of biochemistry (q.v.) and biophysics, but like the latter it can only make correlations and cannot reduce the facts of one level to those of a lower level. Under the view here exposed, there is justification for all the prevailing methods of investigating the phenomena of consciousness, but the justification cannot be extended to the metaphysics which is consciously or subconsciously brought in with each method. Thus, behaviorism is a metaphysic means of materialistic monism, but this extrapolation of the doctrine is not at all necessary to the positive method of charting individual behavior and thereby predicting conduct. The same principle applies to structuralism and the psychoanalytic methods of investigating consciousness. Whatever conflict arises exists between rival metaphysical dogmas and not in the positive intellectual organization of facts.

Woodworth, *Psychology, a Study in Mental Life* (1920); *The Unconscious, a Symposium*, by C. M. Child, K. Koffka, J. E. Anderson, etc. (1928).

**CONSTANT, FRANK HENRY** (1869- ). An American engineer, born at Cincinnati, Ohio, on July 25, 1869. He was graduated in 1891 at the University of Cincinnati, and at once entered upon the practice of his profession, as assistant engineer of the King Bridge Company. In 1893-95 he was with the Osborn Engineering Company. In 1895 he became assistant professor of structural engineering at the University of Minnesota and two years later was made full professor. In 1914 he was called to the chair of civil engineering and made head of the department at Princeton.

**CONSTANTINE I, kōn'stan-tīn, KING OF GREECE** (1868-1923). (See VOL. V.) His connection with the German Imperial family (his wife was the sister of the former German Emperor) and his known sympathies for German methods generally, prompted him to maintain Greek neutrality in the World War. The ensuing struggle between him and Venizelos, who was disposed toward an alliance with the Allies, in large part made up the history of Greece in the eventful years 1914-17. The occupation of Saloniki by an Allied Army, the formation of a Venizelist "Provisional government," the capture of Athens by English and French contingents, all combined to seal Constantine's fate. He yielded to the Allied demand and on June 11, 1917, relinquished his throne in favor of his second son Alexander, living in exile until December, 1920. The death of his son and the overthrow of Venizelos in the election of November, 1920, resulted in his triumphal reentry into his capital, and it was largely to rehabilitate his fortunes that he embarked on the Anatolian adventure (June, 1921). The disastrous defeat that his armies suffered in the Greco-Turkish War (1921-22) and the consistent refusal of the Allies to support or recognize his aspirations again combined to embarrass him, and he was forced to abdicate a second time, Sept. 27, 1922. He took refuge at Palermo, where he died, Jan. 11, 1923. See GREECE, under *History*.

**CONSTANTINOPLE.** The maritime centre and principal city of Turkey. The population including Scutari, Pera, and Stamboul, according to the census of 1927, was 673,029. One of the most dramatic changes made by the Nationalist government was the shifting of the capital of Turkey from Constantinople to Angora. On Apr. 11, 1920, the Constantinople Parliament was dissolved, and on Oct. 13, 1923, by decision of the Grand National Assembly, Angora was declared to be the capital of Turkey. Up to the abdication of the Sultan in November, 1922, however, a government deriving its authority from him continued to exist in Constantinople but exerted no effective power outside the city. In the Grand National Assembly, Constantinople has only 15 deputies, or 5 per cent of the total number in the Chamber, and this city of past power has become merely a province of the Nationalist government. The occupation of Constantinople by the Allies also came formally to an end in October, 1923.

The most important events that have taken place in Constantinople are the refugee situation, the devastating fires, and the emancipation of women. During the War, refugee populations of entire villages—Greek, Armenian, Russian, Jewish, Georgian—reached the city penniless, there to live in open streets, on the ruined walls, in huts made of boxes, and in discarded army tents. The Red Cross and Near East Relief adequately met the situation, establishing camps, hospitals, clinics, workshops, and orphanages. By the activities of these organizations, it is estimated that in the Near East 1,500,000 lives were saved, 132,500 of them being orphan children; 12,500,000 persons were fed during famine periods; and 6,000,000 persons received medical aid. The destruction caused by devastating fires has also caused great suffering in Constantinople. The Turkish daily, *Vakit*, announced in 1920 that during the past decade 17,191 buildings in Constantinople had been burned, yet within that period only 532 structures had been rebuilt. These losses have been attributed to the typical frame construction, lack of repair, and a primitive system of fire control.

A third great change has been the emancipation of women. With the passing of harem traditions, the women of Constantinople have advanced from a childlike ignorance to an intelligence that is astonishing when the conditions under which they have lived for hundreds of years are considered. The University of Constantinople, including the medical department, has been opened to women students, and women are found at work in the offices of the Government or in business houses. The Nludafa-a-y-Houkouki Nissvar (Society for the Defense of the Rights of Women) which was organized at Constantinople in 1923 has these aims: To transform the outdoor costume of Turkish women (casting aside the veil); to ameliorate the rules of marriage according to the exigencies of common sense; to fortify woman in the home; to render mothers capable of bringing up their children according to modern principles; to encourage women to earn their own living and to find them work in order to remedy the present evils; to open women's schools in order to give to young Turkish girls an education suited to the needs of their country and to improve those schools already existing.

The shipping activities of Constantinople are devoted primarily to through traffic and trans-

shipment. In 1927 the number of vessels clearing and in transit was 13,195, with a total tonnage of 11,321,654. In 1926 the Turkish government created a free zone at Constantinople in the neighborhood of Seraglio Point. Further docks were erected, landing cranes installed, and other modern improvements undertaken. The Hippodrome is being excavated under the direction of archaeologists of the British Academy with the understanding that the treasure found is to be handed over, in accordance with Turkish law, to the Stamboul Museum. In 1925 Yildiz Kiosh, famous as the residence of Sultan Abdul Hamid, was converted into a casino. See DARDANELLES and BOSPORUS STRAITS.

**CONWAY, ROBERT SEYMOUR** (1864- ). An English classical philologist (see VOL. VI). He was lecturer in classics at Harvard University in 1927 and Wilding Lecturer in Christchurch College, Canterbury, New Zealand, in 1928. Honorary degrees were bestowed on him by Dublin (Litt.D., 1921), Padua (1922), and Oxford (D.Litt., 1928). His later works include *New Studies of a Great Inheritance* (1921); *The Making of Latin* (1923); *Poetry and Government* (1928); and *Harvard Lectures on the Vergilian Age* (1928).

**CON'WAY, SIR (WILLIAM) MARTIN** (1856- ). An English art critic and explorer (see VOL. VI). He became trustee of the Wallace Collection (1910), trustee of the National Portrait Gallery (1922), and president of the Kent Archaeological Society (1923). His recent books include *The Sport of Collecting* (1914); *The Crowd in Peace and War* (1915); *The Abbey of St. Dennis* (1916); *Mountain Memories* (1920); *The Van Eycks and Their Followers* (1921); *Palestine and Morocco* (1923); and *Art Treasures of Soviet Russia* (1925).

**COOK, GEORGE CRAM** (1873-1924). An American author, born at Davenport, Ia., and educated at the universities of Iowa, Harvard, Heidelberg, and Geneva. In 1895-99 he taught in the University of Iowa and afterward for a short time in Leland Stanford, Junior, University. In 1911 he became associate literary editor of the *Chicago Evening Post*, and in 1915 director of the Provincetown Players. His works include: *In Hampton Roads* (1899); *Roderick Taliaferro, a Story of Maximilian's Empire* (1903); *Evolution and the Superman* (1906); *The Oasism* (1911); *Battle-Hymn of the Workers* (1912); *The C. T. U.* (1914); *Suppressed Desires* (1920; first written as a play in 1915); and *The Spring* (1921; produced as a play and published).

**COOK, PHILIP** (1875- ). An American Protestant Episcopal Bishop of Delaware, born at Kansas City, Mo. He was graduated at Trinity College in 1898 and from the General Theological Seminary in 1902. Ordained in 1902, he served as a missionary in North Dakota for two years and then became vicar of the Chapel of the Incarnation in New York City. In 1911 he was called to other pastorates, going

to Baltimore in 1916, where he remained until 1920, when he was elected Bishop of Delaware. He was a delegate to the General Conventions of the Protestant Episcopal Church in 1913 and 1919. During the World War, he served in France with the 77th Division of the American Expeditionary Forces as Y. M. C. A. secretary.

**COOKE, MARJORIE BENTON** (?-1920). An American author, born at Richmond, Ind. She began writing for magazines at an early age, and won success for her monologues, which she delivered throughout the country after 1902. Three one-act plays by her were produced on the stage. *Bambi*, a novel produced in 1914, had an immediate and remarkable success. She also wrote: *Modern Monologues* (1903); *Dramatic Episodes* (1905); *Plays for Children* (1905); *The Girl Who lived in the Woods* (1910); *Dr. David* (1911); *The Dual Alliance* (1915); *Cinderella Jane* (1917); *The Threshold* (1918); *The Clutch of Circumstance* (1918); *The Cricket* (1919); *Married?* (1921). She died in 1920 while in Japan on a world tour.

**COOKE, MORRIS LLEWELLYN** (1872- ). An American engineer, born at Carlisle, Pa. After having served as a reporter on various Philadelphia, Denver, and New York newspapers, he was graduated from Lehigh University (M.E., 1895). He practiced his profession with various corporations until 1905, after which he devoted himself to consulting practice. In 1910 he made a study of collegiate administrative methods for the Carnegie Foundation. In 1911-15, he was director of the Department of Public Works in Philadelphia. During the Spanish-American War, he served in the United States Navy as assistant engineer, and during the World War he was in Washington as chairman of the storage system of the War Industries Board of the Council of National Defense (1917) and as assistant to the chairman of the United States Shipping Board (1918). He is the author of *Academic and Industrial Efficiency* (1910), *Snapping Cords* (1915), and *Our Cities Awake* (1918).

**COOK ISLANDS.** See PACIFIC OCEAN ISLANDS.

**COOLEY, MORTIMER ELWYN** (1855- ). An American engineer (see VOL. VI). He was elected president of the Federated American Engineering Societies in 1921 and continued the investigation of public utility properties in American Cities.

**COOLIDGE, ARCHIBALD CARY** (1866-1928). An American professor of history, and one-time member of the diplomatic service (see VOL. VI). In 1918 he was sent as special agent of the American State Department to Sweden and northern Russia. The following year, he was chief of the mission attached to the Peace Conference which spent five months in Vienna and three months in Paris. In 1921 he became a member of the American Relief Administration in Russia. He was author of *The Origins of the Triple Alliance* (1917), and translator of *Secret Treaties of Austria-Hungary, 1879-1914*, by Alfred Francis Pribram (2 vols., 1920-21). He was also a contributor to *The American Historical Review* and other publications and was editor of *Foreign Affairs*.

**COOLIDGE, CALVIN** (1872- ). A President of the United States, born at Plymouth, Vt. He was graduated at Amherst College, Mass., and practiced law at Northampton, Mass.

After holding various local offices, he served in the Massachusetts State Senate (1912-15), was Lieutenant Governor of Massachusetts (1916-18), and Governor (1919-20). He first became nationally known through his intervention in the Boston police strike of 1919, when his prompt action in calling out the State troops prevented serious trouble and ended the strike. He was hailed throughout the nation as a strong champion of law and order, and his selection as candidate for the vice presidency was felt to add greatly to the chances of Republican success at the polls. At the convention, he was nominated by acclamation. When President Harding died on Aug. 2, 1923, Calvin Coolidge became President, taking the oath of office on August 3. He announced that he would follow in general the policies of his predecessor. Toward the end of the year 1923, the so-called "oil scandals" caused him much embarrassment. Both civil and criminal actions were begun in the courts by the Government and continued with varying success. The criticisms launched against Attorney General Daugherty and Secretary of the Navy Denby finally forced their resignations from the cabinet and relieved the situation somewhat. But Congress proved more and more independent of his leadership by passing the bonus bill over his veto, changing the Mellon Tax Bill, and refusing to accede to his request in regard to postponing the operation of the Japanese exclusion part of the Immigration Bill. He was nominated at the Republican National Convention in June, 1924, as candidate for the Presidency to succeed himself and was elected on November 4, obtaining 382 electoral votes from 35 states. In the first year of his second administration, there was a material reduction in the public debt and also in Federal taxation. In 1927 he vetoed the McNary-Haugen Bill for farm relief. It was generally conceded that he could have obtained the party's nomination for the Presidency in 1928, but on Aug. 2, 1927, he announced that he did not "choose to run for President in 1928." In the same year, his appointment of Dwight Morrow as Ambassador to Mexico resulted in greatly improved relations between the two countries. In January, 1928, he made his first trip outside of the United States while President to address the Pan-American Conference at Havana, Cuba. He lent his support to the Kellogg Peace Pact but was criticized because he advocated in an Armistice Day speech, Nov. 11, 1928, the adoption by Congress of a cruiser-construction programme which had been considerably reduced from that proposed in a bill introduced in the preceding Congress. At the conclusion of his term, he returned to his home at Northampton where he wrote a number of magazine articles on his life and various aspects of the Presidency. Two collections of his speeches have been published, *Have Faith in Massachusetts!* (1919), and *The Price of Freedom* (1924).

**COOLIDGE, WILLIAM DAVID** (1873- ). An American physical chemist and inventor, born at Hudson, Mass. He received his technical training at the Massachusetts Institute of Technology, and Leipzig University (Ph.D., 1899). During the years 1901-05, he was successively instructor and assistant professor in physical chemistry at the M. I. T. From 1905 to 1908, he was engaged on research in physico-chemistry for the General Electric Company at Schenectady, N. Y., and since 1908 he has been

assistant director of that company's research laboratory. He was awarded the Rumford Medal in 1914 for the invention and applications of ductile tungsten. He also received the Howard N. Potts Medal for the development of a new and improved X-ray tube, the Louis Edward Levy Medal of the Franklin Institute, and the gold medal of the American College of Radiology. He is a member of the National Academy of Sciences.

**COOPER, COLIN CAMPBELL** (1856- ). An American artist (see VOL. VI). He won a gold medal for oil painting and a silver medal for water color at the Panama-Pacific International Exposition (1915) as well as other prizes in 1918 and 1919. One of his best recent pictures was "Broadway in War Time" in the Pennsylvania Academy of Fine Arts.

**COOPER, HUGH LINCOLN** (1865- ). An American hydraulic engineer, born at Sheldon, Houston Co., Minn. With only a high-school education, he began in bridge engineering at eighteen and at twenty-five was chief engineer and superintendent of the Chicago Bridge & Iron Co. Since 1891 he has been engaged in hydraulic engineering as applied to power development for electric uses. He designed and largely built the hydroelectric plant of the Mississippi River Power Company at Keokuk, Iowa, the Toronto Power Company's plants at Niagara Falls, and the Muscle Shoals, Ala., water-power project. Later, he was consulting engineer for a \$75,000,000 water-power and navigation project in Ukraine, Russia, and was commissioned to design the great power dam in Egypt.

**COOPER, IRVING STEIGER** (1882- ). An American bishop of the Old Catholic Church, and theosophist, born at Santa Barbara, Calif., and educated at the University of California and at Madras, India. He was consecrated regional bishop for the Liberal Catholic Church for the United States, in 1919. He wrote: *Methods of Psycho Development* (1911); *Ways to Perfect Health* (1912); *The Secret of Happiness* (1912); *Theosophy Simplified* (1915); *Reincarnation, the Hope of the World* (1917).

**COOPER, THE REV. JAMES** (1846-1922). A British theologian (see VOL. VI). In 1916 and again in 1921, he was president of the Scottish Ecclesiological Society, an office which he had held in 1903 and 1911. He was Moderator of the General Assembly of the Church of Scotland in 1917. In 1922 he retired from his professorship in church history at the University of Glasgow. His later works include: *Our Sacred Heritage* (closing address as Moderator, 1917), and *Reunion, a Voice from Scotland* (1918).

**COOPER, LANE** (1875- ). An American university professor (see VOL. VI). He was acting associate professor during the summer term of 1914 at the University of Illinois. The following year he became full professor of English language and literature at Cornell University. Among his later works are *Methods and Aims in the Study of Literature* (1915, 1921); *A Concordance to the Works of Horace* (1916); *Louis Agassiz as a Teacher* (1917); *The Greek Genius and its Influence* (1917); *George Meredith, an Essay on Comedy* (1918); *Two Views of Education, with Other Papers* (1922); *An Aristotelian Theory of Comedy* (1922); *Concordance of the Latin, Greek and Italian Poems of John Milton* (1923); and *The Poetics of Aristotle* (1923).

**COOPER, THOMAS POE** (1881- ). An American agriculturist, born at Pekin, Ill. From 1902 to 1907, he was statistical agent of the Minnesota Experiment Station and special agent of the Bureau of Statistics, United States Department of Agriculture. He graduated from the University of Minnesota in 1908 and until 1911 was assistant in farm management and agricultural economist at that university. From 1914 to 1917, he was director of the North Dakota Experiment Station and in 1918 became dean and director of the Agricultural College of the University of Kentucky. He was chief of the Bureau of Agricultural Economics, U. S. Department of Agriculture, 1925-26.

**COOPER, WILLIAM JOHN** (1882- ). An American educator, born in Sacramento, Calif., who was appointed head of the U. S. Bureau of Education by President Coolidge in December, 1928. He attended the University of California, receiving the degrees of A.B. and M.A., and then became successively teacher, supervisor, and district superintendent in various California public and high schools. He also taught education at summer sessions of the Universities of California, Oregon, and Washington. He was superintendent of schools at Fresno, Calif., from 1921 to 1926, and at San Diego, Calif., from 1926 to 1927, when he was appointed state superintendent of public instruction.

**COÖPERATION.** If one idea has taken universal hold in our modern industrial world, it is that of the coöperative society. It has many phases: there are coöperative stores, credit unions, building and loan associations, insurance groups, agricultural pools, artisans' and labor productive societies, etc. Local societies are grouped together sectionally and nationally. In some countries, from 40 to 45 per cent of the population was being reached through consumers' coöperative organizations. In 35 countries<sup>1</sup> examined by the U. S. Bureau of Labor Statistics, there were found to be 300,000 societies with a combined membership of more than 44,500,000 persons. The consumers' coöperatives alone number 50,000 societies in 22 countries, with a membership of 27,000,000 persons and yearly sales of over five and one-half billion dollars. A single fact, such as the following, is of extraordinary significance: The English Coöperative Wholesale Society was the largest manufacturing, trading, and landowning unit in the United Kingdom.

In Great Britain, there were 1825 consumers' coöperatives with 5,017,464 members; in Denmark, 5148 societies with 865,002 members; in France, 4131 with 3,111,322 members; in Germany, 50,181 with 3,382,011 members; in India, 61,016 with 2,508,827 members; in Russia, 78,865 with 19,129,033 members; in the United States, 12,149 with 2,815,230 members. In various countries, various types of societies had been developed more rapidly than others. In Great Britain and the United States, the consumers' coöperatives led all the rest. In Germany, the credit society had flourished mightily; and in Denmark, the agricultural society led. France and Italy were the homes of workmen's produc-

tive groups, and while in Italy these had been destroyed by the Fascist régime, in France, they still prospered.

The following table indicates how important consumers' coöperatives are in some of the countries of the world:

PERCENTAGE THROUGH	OF POPULATION OF CONSUMERS' SOCIETIES	SUPPLIED COÖPERATIVE	Per cent
United Kingdom			45
Denmark			40
Finland			40
Hungary			40
Iceland			35-40
Switzerland			35
France			30
Russia			30
Belgium			20
Germany			20
Sweden			20
Norway			15
Netherlands			10
Bulgaria			8
Australia			6
United States			2.5
Argentina			1

An examination of the membership and sales of local consumers' societies for the most successful countries in which the system is in operation (compared with the United States) would indicate the following:

Country	Average membership per society	Average yearly sales per society	Average yearly sales per member
Belgium	5,004	\$357,385	\$71
Great Britain	3,810	687,764	181
Germany	5,218	139,536	43
Australia	2,888		
United States	810	105,543	354

The Federal Bureau of Labor Statistics in 1927 published an important summary of the growth of the coöperative movement (other than agricultural) in which it pointed out the following facts about coöperation in the United States: 1. In 1925 the total coöperative membership was 700,000; the business done was \$300,000,000, and several million people were reached. 2. The Middle West has been the seat of the greatest development of the consumer's coöperatives. Credit unions, which had their greatest growth after 1920, developed largely in the East. 3. The workers' productive societies have shown the smallest growth. In 1925 these societies, which had some 4500 members, did a business of \$9,000,000. 4. The credit unions have developed more rapidly than the regular consumers' societies. In 1925 these made loans of more than \$20,000,000 and had a membership of 170,000 persons. 5. The housing coöperative societies have made their appearance for the most part in New York City. These groups have provided dwellings for 1805 families and own \$4,000,000 in property. 6. The consumers' societies appear to have weathered successfully the hard times that followed 1920. In 1925 nearly 25 per cent of these had sales of \$100,000 or more. Nearly three-fourths of them showed profits for the year. The societies have been putting their money into reserves instead of distributing them as dividends, as shown by the fact that the reserves of the societies total more than half of the paid-in share capital. 7. The coöperative wholesale business appears to have been abandoned. The following table shows the existence of the societies by geographical divi-

<sup>1</sup> These countries are:

Argentina, Australia, Austria, Belgium, Bulgaria, Canada, Ceylon, China, Czechoslovakia, Denmark, Egypt, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, India, Japan, Jugo-Slavia, Latvia, Malay States, Netherlands, Norway, Palestine, Poland, Portugal, Rumania, Russia, South Africa,

TABLE 2  
PERCENTAGE OF TOTAL COÖPERATORS  
[By geographical divisions]

	Consumers' societies	Credit and workers' societies
New England	18.9	48.2
Middle Atlantic	10.3	45.4
East North Central	29.0	1.5
West North Central	27.2	.5
South Atlantic	1.0	1.9
East South Central	.5	.7
West South Central	1.3	.9
Mountain	.8	..
Pacific	11.1	.9
Total	100.0	100.0

The accompanying two tables show the status of the consumers' societies in the United States:

TABLE 3  
TOTAL AND AVERAGE MEMBERSHIP OF CONSUMERS' COÖPERATIVE SOCIETIES  
IN 1925

Type of society	Number of societies reporting	Membership Total	Average per society
Retail store societies dealing in:			
General merchandise	310	55,431	179
Groceries	47	11,129	237
Groceries and meats	38	21,399	563
Students' supplies	9	30,848	3,428
Other commodities	5	953	191
Total	409	119,760	293
Gasoline filling stations	7	3,615	516
Bakeries	9	4,834	537
Laundries	2	263	132
Boarding houses	11	1,578	143
Restaurants	5	2,733	547
Water-supply societies	2	76	38
Miscellaneous societies	5	6,442	1,288
Grand total	450	139,301	310

TABLE 4  
COMPARISON OF BUSINESS DONE BY CONSUMERS' SOCIETIES EACH YEAR, 1920 AND 1925

Type of society	Number of societies	Amount of business	Number of societies	Amount of business
Retail store societies handling:				
General merchandise	204	\$24,097,722	322	\$29,610,246
Groceries	30	2,363,523	49	3,487,979
Groceries and meats	26	2,495,261	36	4,346,690
Students' supplies	7	1,079,981	11	2,899,626
Other commodities	5	326,621	8	401,069
Total	272	\$30,863,108	426	\$40,745,610
Wholesale societies	8	3,333,132	3	2,459,521
Gasoline filling stations	..	..	9	742,473
Bakeries	6	571,434	9	1,189,737
Laundries	1	16,042	2	37,786
Boarding houses	8	145,051	10	150,853
Restaurants	3	112,707	5	679,110
Water-supply societies	1	589	2	1,559
Miscellaneous	8	809,710	5	3,704,189
Grand total	292	\$34,851,773	471	\$49,710,788

See AGRICULTURE for discussion of the agricultural coöperatives in the United States.

**COÖPERATIVE BANKS.** See LABOR BANKS.

**COÖPERATIVE MARKETING.** See CO-OPERATION; COTTON; AGRICULTURE; and AGRICULTURAL CREDIT.

**COÖPERATIVE MORTGAGE BANKING.** See AGRICULTURAL CREDIT.

**COOVER, JOHN EDGAR** (1872- ). An American psychologist born at Remington, Ind. He was educated at the Colorado State Normal School and Leland Stanford, Junior, University.

After 1910 he was a member of the psychology department of the last-named institution, becoming associate professor in 1921. He is the author of *Investigation with a Trumpet Medium* (American Society for Psychical Research, 1915), *Formal Discipline from the Standpoint of Experimental Psychology* (1916), and *Experiments in Psychical Research* (1917). He is also the contributor of a number of articles on psychology, psychical research, education, and statistical methods, published in professional journals.

**COPE, SIR ARTHUR STOCKDALE** (1857- ). A British portrait painter and fellow of the Royal Academy. After attending schools at Norwich and Wiesbaden, he studied art at Carey's and at the Royal Academy schools. His paintings, which he has exhibited at the Royal Academy since 1876, include portraits of King Edward VII, the German Emperor, King George V, and the Prince of Wales. He was knighted in 1917, and was made a Knight Commander of the Royal Victorian Order in 1927.

**COPEAU, kō'pō', JACQUES** (1879- ). A French actor-manager, formerly director of the Théâtre Vieux Colombier. He was a reformer in the theatre. He successfully waged war against decrepit tradition, but he kept traditions which remained full of life and richness. The Classics, for the most part, formed his repertory. Among his performances were: Dostoyevsky's *The Brothers Karamazov*, a very moving production and adaptation; *Twelfth Night*, one of the plays most frequently presented; and André Gide's *Saul*, one of his most important theatrical achievements. In 1919 the Vieux Colombier came to New York City, and he took the part of Washington in Percy Mackaye's *Washington*. He wrote *Miscellaneous Pamphlets and Clippings, 1914-1919*; *Études d'art dramatique; critique d'un autre temps* (1923), and *La maison natale* (1923; tr. 1924). Consult *The Art of the Vieux Colombier*, by Waldo David Frank (1918).

**COPELAND, ROYAL S (AMUEL)** (1868- ). An American physician and ophthalmologist, and United States Senator from New York. Born in Dexter, Mich., he received his M.D. from the University of Michigan, 1889, and in 1905 was made ophthalmologist to that university. He moved to New York in 1908 to occupy the same chair and assume the deanship of the New York Homeopathic Medical College and Flower Hospital. He began his political career as mayor of Ann Arbor in 1901-03 and was president of the local Board of Education in 1907-08. In 1918, he became Commissioner of Public Health and president of the Board of Health, New York City, resigning in 1923 upon his election as Senator. He was reelected in 1928 for the term 1929-35. He published *Refraction*, in collaboration, in 1906, and *The Health Book* in 1924.

**COPEMAN, SYDNEY A. MONCKTON** (1862- ). A British physician and authority on public health, hygiene, and forensic medicine. He was educated in arts and medicine at the University of Cambridge, became a member of the medical faculty of the University of London, and lectured on his special subjects in a number of British universities. From 1916 to 1917, he was lieutenant colonel in charge of the hygiene department of the Royal Army Medical College. His principle work is *Vaccination, Its Natural History and Pathology* (1898).

**COPENHAGEN.** The capital and largest city of Denmark. The population in 1925 was 587,150; including the suburbs it was 731,496 or 21 per cent of the total population of the country. From 1916 to 1921, extensive harbor improvements were carried out, representing an expenditure of 40,000,000 kroner. These improvements involved the reclamation of more than 5500 acres of land and an increase in the bulthead of more than 5000 yards. The new harbor has a total expanse of about 13 kilometers (8.078 miles), the distance between the breakwaters on either side of the entrance being 8 kilometers (4.97 miles). The wharfrage of the free port was increased to 4773 meters (5250 yards). In 1927, 17,000 vessels of 5,279,000 tonnage were cleared through the port of Copenhagen. The seat of the Government, the Foreign Office, and the Supreme Court have been located in Christiansborg Castle, which was built some years ago on the ruins of a former castle destroyed in the great fire of 1854. In the basement may be seen ruins of the former castle and fragments of Absalon's mediæval fortress which were revealed by excavations made in 1918. Over the gateway to the castle is a tablet, unveiled Feb. 11, 1919, in memory of the defense of Copenhagen in 1659—the 250th anniversary of the event. Other buildings in the vicinity are the old Hofteater (Court Theatre) which has been converted into a theatrical museum; the royal stables, housing a valuable collection of harness and coaches; the arsenal, containing a historical collection of arms; the royal archives from the time of Frederik III; and the royal library. The town has grown around the nucleus of these buildings, and their style of architecture and atmosphere, so to speak, pervades the city. Modern developments include the Langelinie Promenade fronting the free port, the grounds and wide boulevards which have been laid out on the old fortifications, the new Raadhus (City Hall), the botanical gardens, and Østre Anlægs Park. In 1924 the Museum of Decorative Arts was installed in a beautiful eighteenth-century edifice.

**COPPER.** The World War naturally had an important effect on the production of copper, as this metal was required in large quantities for munitions. The world's production amounted to 1,104,517 short tons in 1913, but under the stimulation of war-time needs, it reached a maximum of 1,585,228 short tons in 1917. Following the War, production declined to a minimum of 601,913 tons in 1921. Since 1921 world output has increased each year until it reached a record total of 1,954,021 short tons in 1928.

Production capacity developed to fulfill requirements during the War was greatly in excess of requirements during the period immediately following the cessation of hostilities. Legal restrictions in the United States prevented producers from making definite agreements to curtail and allocate production allowances in accordance with consumptive demand. Consequently, the industry passed through several years of overproduction immediately following the War with a resultant reduction of price levels that meant unprofitable operation for many producers, particularly in the United States where operating costs are high because of the low-grade ores treated, high labor costs, and exorbitant taxation charges in many States. The price of copper averaged 15.27 cents per pound in New York in 1913; in 1916

the average price per pound was 27.2 cents. During 1921, the year of greatest deflation, the price declined to 12.5 cents per pound. During the next six years, the average price remained below 14.5 cents per pound, but advanced to 14.57 cents in 1928 and was in excess of 10 cents per pound in the early months of 1929 as the result of a great increase in consumptive demand that taxed the productive capacity of the mines and metallurgical plants.

Several statistical organizations formed in the United States since the War have been of material assistance in directing the industry back into its path of normal progress. The American Bureau of Metal Statistics was formed in 1921 to compile and distribute data relating to production, stocks, and consumption of all the more important non-ferrous metals. In the same year, the Copper and Brass Research Association was organized to develop new uses for copper and brass products and to educate the public to the benefits that might be derived from the use of these products in places where other substances previously had been accepted without question. Copper Exporters, Incorporated, was formed in 1926 for the purpose of fixing prices in the export market. In 1927 the Copper Institute was formed for the purpose of providing domestic producers and particularly the selling agencies with detailed data of sales positions, stocks, shipments, and other information of that nature at weekly intervals. These various agencies have been important factors in securing the rationalization of the copper industry.

An unusually high rate of consumption prevailed during the closing months of 1928 that resulted in the breaking of all previous production and consumption records. Increased use of copper in such industries as automobile, radio, cable, railway electrification, building, and others, resulted in the speeding up of productive activity to a point never previously approached, not even during the height of the war-time demand.

The United States continues as the leading producer of copper, though Chile in second place is gaining ground and recent developments in Africa make it evident that ere long African copper will be a very important factor in the world trade. Increased production will come from Canada, also, from several new properties that are not yet fully equipped for operation, and from increased output of copper from the copper-nickel deposits of the International Nickel Company in Ontario. In the United States, on the other hand, no new properties of importance have been discovered, though there is little doubt that additional equipment at a number of the large mines will permit considerable expansion of productive operations.

Several new producers recently have made their entry, of which Andes Copper in Chile, Noranda in Quebec, and Bwana M'Kubwa in northern Rhodesia, are likely to prove of primary importance. Important new developments under way in 1929 included the Flin Flon and Sheritt-Gordon in Manitoba, and the Roan Antelope and N'Changa properties in northern Rhodesia. Present producers which can and doubtless will increase their capacity considerably if demand continues at the present high rate are Utah Copper, Nevada Consolidated, Inspiration, Phelps Dodge, and Calumet & Arizona in the United States; Chile Copper, Andes Copper, and Braden in Chile; Cerro de Pasco in

Peru; Noranda and International Nickel in Canada; Greene Cananea and Montezuma in Mexico; Furukawa in Japan; Union Minière du Haut Katanga in the Belgian Congo; and Bwana M'Kubwa and associated companies in northern Rhodesia.

### WORLD PRODUCTION OF COPPER From Mineral Industry

			Short Tons

### SUMMARY OF FEATURES OF THE COPPER INDUSTRY IN THE UNITED STATES IN 1927 AND 1928

#### U. S. BUREAU OF MINES

	1927	1928
Production of copper:		
Smelter output	1,684,040,983	1,825,900,398
Mine production	1,649,959,370	(*)
Refinery production of new copper:		
Electrolytic	1,520,076,181	1,607,120,026
Lake	195,135,199	179,104,311
Casting	3,740,819	5,573,050
Total domestic	1,718,952,199	1,791,797,387
Total domestic and foreign	2,325,763,709	2,487,607,779
Total new and old copper	3,806,000,000	(*)
Ore produced:		
Copper ore	56,725,460	(*)
Average yield of copper	1.41	(*)
Copper-lead and copper-zinc ores	418,601	(*)
Average price per pound	18.1	14.4
Imports (unmanufactured)	718,322,990	787,073,640
Exports of metallic copper	1,069,498,121	1,121,186,640
Withdrawn from total supply on domestic account:		
Total new copper	1,422,959,219	1,608,538,878
Total new and old copper	2,403,000,000	(*)
Stocks of refined copper	171,000,000	114,000,000
Stocks of blister and materials in solution	401,000,000	423,000,000
Value of smelter production from domestic ores	\$ 220,609,000	\$ 262,980,000

\* Figures not yet available.

\* Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined material.

\* At the end of the year.

In 1928 exports of copper from the United States were valued at \$169,823,077 of which refined copper in ingots, bars, or other forms amounted to 948,309,890 pounds, valued at \$140,340,375. Germany was the largest customer for the refined metal, taking 206,549,919 pounds, valued at \$30,012,066; followed by the United Kingdom with 185,816,840 pounds, valued at \$27,657,763; France with 171,440,871 pounds, valued at \$25,821,800; Italy with 115,427,602 pounds, valued at \$17,606,139; Belgium with 77,431,816 pounds, valued at \$11,248,936. The United States in 1928 imported copper to the value of \$98,187,440, of which copper ores, concentrates, and regulus were valued at \$16,734,735. Unrefined, black, blister, and converter copper in pigs, bars, etc. were valued at \$67,598,035, and refined copper at \$12,634,463.

**CORAL REEFS.** See GEOLOGY.

**CORBIN, JOHN** (1870- ). An American dramatic critic and author (see VOL. VI). He wrote *The Edge* (1915) and until 1916 was secretary of the Drama Society of New York. From 1917 to 1919, he was dramatic critic of the New York Times and from 1919 to 1926 editorial writer for the same paper. He produced Shakespeare's *Tempest* (with full text in the Elizabethan manner) in 1916, and in 1922 published *The Return of the Middle Class*.

**CORELLI, MARIE** (1864-1924). An English novelist (see VOL. VI). Her later publications include: *Innocent, Her Fanny and His Fact* (1914, 1921); *The Young Diana* (1917); *My Little Bit, a Record of War Work* (1919); *The Love of Long Ago* (1920); *The Secret Power* (1921), and *The Treasure of Heaven: a Romance of Riches* (1921).

**COREY, WILLIAM ELLIS** (1866- ). An American capitalist, born in Braddock, Pa., and educated in the public schools and at Duff's College, Pittsburgh. He entered the Edgar Thompson Steel Works at the age of 16, and became superintendent of the plate mill at the Homestead Steel Works in 1889, succeeding Charles M. Schwab as general superintendent at these works in 1897. From 1901 to 1903, he was president of the Carnegie Steel Company, and from that year to 1911 was president of the United States Steel Corporation. In the latter year, he resigned this post to become chairman of the board of the Midvale Steel and Ordnance Company. He was director and official in many important financial institutions.

**CORFU DECLARATION** and Other Items. See ALBANIA; GREECE; ITALY; JUGOSLAVIA.

**CORK.** A commercial city of the Irish Free State and the third city of Ireland. The population of Cork County Borough in 1926 was 78,490. Cork's chief commercial advantage is its proximity to the Harbor of Cobh (Queenstown) with which it is connected by the River Lee. In 1927, 1377 vessels with a tonnage of 622,559 entered the port, and 1406 vessels with a tonnage of 623,570 were cleared. In December, 1920, part of the business section of Cork was burned in the course of a fire started by incendiaries. Since 1923 so many improvements have been carried out that the whole appearance of the city has been changed. The greater part of St. Patrick's Street, the principal thoroughfare, has been rebuilt; most of the principal streets have been remade with asphalt surfaces; all the quays have been relaid on concrete foundations; and the old sewage tunnel has been reconstructed. The water-supply system also has been over-

hauled, a filtration plant installed, and waste so efficiently eliminated that the daily consumption of water has been reduced from 50 to less than 30 gallons per head of population. In 1927 a municipal loan of £100,000 was provided for housing construction. One of the principal changes has been the location of the Ford motor industry in Ireland on Cork's once-famous race course.

**CORN.** Corn is produced on three-fourths of the farms in the United States. The average annual production of the country for the years 1919-28, inclusive, was 2,857,000,000 bushels. The average annual production of the leading corn states for the same period was as follows: Iowa, 431,820,000 bushels; Illinois, 321,278,000 bushels; and Nebraska, 217,380,000 bushels. The average acre yield in the United States increased from 26.1 bushels for the ten-year period 1910-19 to 28.25 bushels for the ten-year period 1919-28. According to U. S. Census reports, of a total acreage of 98,401,627 acres in 1924, 82,328,843 acres, yielding 1,823,880,173 bushels, were harvested for grain, 4,227,812 acres producing 28,407,960 tons were cut for silage, 6,672,646 acres were cut for fodder, and 5,172,326 acres were pastured off with hogs. Since the World War, corn production in southeastern Europe has more than regained its pre-war status. The corn area of Russia in 1928 was 10,690,000 acres, the area having more than doubled during the five-year period. Argentina, which has increased its average annual production in ten years, continues to lead all countries in corn exports.

The average annual total value of the corn crop of the United States for the five-year period 1910-14 was \$1,577,000,000, but the higher price of corn from 1916 to 1919 raised the value for that period to \$3,024,000,000. The 1920 crop was the largest ever harvested, but prices were receding and its total value was only \$2,150,000,000, while in 1921, with a yield only 4 per cent under the crop of 1920, prices had dropped so low that the total value was only \$1,303,000,000, or only 43 per cent of the annual value during the war period and about 16 per cent less than the pre-war value although the crop was 10 per cent larger than the pre-war average. During the War, the average farm price of corn rose above \$1.90 per bushel; but the price began to decline in 1920 and reached the low point at the end of 1921, reducing the purchasing power of corn far below that of any other year. A marked rise in the cost of production since 1914 coupled with the rapid and severe decline in price, was one of the principle factors leading to the agricultural economic crisis beginning in 1920 and continuing for a series of years.

The United States Grain Standards Act of Aug. 11, 1916, required that in all interstate buying and selling of shelled corn the grades used shall be the Federal grades established by the Secretary of Agriculture. According to these grades, based on condition and quality, the best corn is graded Number One and corn lower in quality is given numerical grades down to and including Number Six, while a "sample grade" is added for corn too low in quality for the numbered grades. As revised and effective Sept. 15, 1927, these standards include grades for weevily corn. To the insect pests attacking the corn crop in the United States was added the European corn borer, first reported near Boston in 1917, and now established in parts of the

New England States, New York, Pennsylvania, Ohio, Michigan, Indiana, and the Province of Ontario in Canada. (See ENTOMOLOGY, ECONOMIC, under *European Corn borer*). The diseases of corn which have become troublesome in recent years are the brown-spot disease, characterized by brown spots usually on the leaf, the leaf sheath and the stalk, and root rot of corn which results in the partial or total decay of the root system causing the plant to lodge, and which attacks also the stalk and the ear.

**Corn Products.** Statistics published by the U. S. Department of Commerce in 1928 showed that the United States in 1925 produced 854,125,000 pounds of cornstarch, 1,444,858,000 pounds of corn sirup, 580,370,000 pounds of corn sugar, and 12,705,000 gallons of corn oil. Corn oil, derived largely from the germ in the corn kernel and formerly used mainly in the manufacture of soaps and paints, is now refined and used for food in the form of lard and butter substitutes, salad and cooking oils, shortening, and other similar substances. It is also used in making rubber substitute. With the increase in the manufacture of corn products during the World War, the annual production of corn oil increased to some extent. Cornstalks, of which the United States, as estimated, produces annually about 125,000,000 tons, are used for the manufacture of paper and paper board and efforts are being made to put this industry on a profitable basis. Corn cobs used as fuel on farms are also utilized in making paper products, adhesives, furfural, and other commodities. Consult *United States Department of Agriculture Yearbooks*, 1921 and 1927. See AGRICULTURE.

**CORN BORER, EUROPEAN.** See ENTOMOLOGY, ECONOMIC.

**CORNELL, KATHARINE** (1900- ). An American actress born at Buffalo, N. Y., who made her first appearance in 1916 with the Washington Square Players in *Bushido* and remained with that company some time, playing *The Death of Tintagiles*, *Plots and Playwrights*, etc. In 1918 she was with the Jessie Bonstelle Stock Company at Buffalo and subsequently toured in *Cheating Cheaters* and *The Man Who Came Back*. In 1919 she played Jo in *Little Women* in London and the next year toured in *The Man Outside*. One of her best characterizations in New York was the part of Eileen Baxter-Jones in *Nice People* (1921). In 1924 she starred in *Candida* and in 1929 in *The Age of Innocence*.

**CORNELL UNIVERSITY.** A non-sectarian, coeducational institution at Ithaca, New York, established in 1865. The university's annual income available for current expenses increased between 1914 and 1928 from \$3,000,000 to approximately \$7,000,000 including \$2,038,000 of State and \$335,000 of Federal appropriations, and over \$250,000 from alumni. A campaign for new endowment, begun in 1919, yielded subscriptions of more than \$6,000,000, mainly in increased salaries for faculty members, and the total productive funds in 1928 were \$21,230,391. The enrollment of students in the autumn of 1928 was 5387 as compared with 5015 in 1914 and the faculty numbered 1106, an increase of 356 over 1914. The volumes in the library numbered 780,000 in 1928. The Baker Laboratory of Chemistry, for which George F. Baker gave \$1,500,000 and the \$400,000 State Building for the department of dairy industry,

were completed in 1923. Other notable gifts were \$500,000 from August Hecksher to endow general research, \$50,000 from Mrs. Sarah Manning Sage for medical research, and an anonymous gift of \$200,000 for pediatrics. In 1928 by agreement with New York Hospital, a single institution was formed to occupy jointly a new building to be erected at an estimated cost of \$11,000,000 between 68th and 70th streets, overlooking the East River, New York City, the joint endowment to be augmented by a large appropriation from the General Education Board and generous legacies provided by the will of Payne Whitney. In 1929 the University received a gift of \$1,500,000 for the erection of a new building for the Cornell Law School. President, Livingston Farrand, LL.D.

**CORPS.** See ARMIES AND ARMY ORGANIZATION.

**CORRESPONDENCE STUDY.** See EDUCATION IN THE UNITED STATES.

**CORTISSOZ, ROYAL** (?- ). An American journalist, born in New York City. For many years he was literary and art director of the *New York Tribune* and its successor the *New York Herald-Tribune*; was a frequent contributor to magazines on art subjects and also lectured much on art. He was the author of *Augustus St. Gaudens* (1907); *John LaFarge* (1911); *Art and Common Sense* (1913); *Life of Whitelaw Reid* (1921); *Nine Holes of Golf* (1922); *American Artists* (1923); and *Personalities in Art* (1925). He edited many classics, including *Don Quixote* and *The Autobiography of Benvenuto Cellini*. He also edited Whitelaw Reid's *American and English Studies*.

**CORTOT, ALFRED** (1877- ). An eminent French pianist and conductor, born at Nyon, Switzerland. He studied at the Paris Conservatoire under Decambes, Rouquou, and Diémer, graduating in 1896 as winner of the first prize. The same year, he made his début in Paris, playing the Beethoven C minor concerto at one of the Colonne concerts. From 1898 to 1901, he was at Bayreuth, studying Wagner's works with J. Kneise and acting as repertor at the festivals. Returning to Paris, he placed emphasis upon the works of Wagner, conducting the first performance in France of *Götterdämmerung* (Théâtre du Château d'Eau, May 17, 1902) and establishing the Association de Concerts A. Cortot. In 1904 he became conductor of the Société Nationale and also became a champion of contemporary French composers. The next year he formed a trio with Jacques Thibaud and Pablo Casals, which immediately won international fame. In 1907 he was appointed professor of piano at the Conservatoire, succeeding Raoul Pugno. Shortly after that he began extensive concert tours of Europe, securely establishing his position among the foremost pianists of the present day. His success at his American début (New York, 1918) was so emphatic that he has become an annual visitor. In 1923 the Royal Philharmonic Society of London awarded to him its much-coveted Gold Medal, an honor bestowed on only one Frenchman before him, Gounod. He is the author of *Principes rationnels de la technique pianistique* (1928).

**COSGRAVE, WILLIAM THOMAS** (1880- ). An Irish statesman, born at Dublin. He was educated at the Christian Brothers' Schools, and, engaging in business in Dublin, amassed a fortune. He was a member of the secret revolutionary organization called the Irish Republican

Brotherhood and a leader in the Sinn Fein ranks, and on May 5, 1916, he was arrested, brought to trial, and sentenced to death. His sentence was changed to imprisonment for life, but he was released in the general amnesty of 1917. In the fall of 1917, he was elected to Parliament, but because of his Sinn Fein principles, did not take his seat. In May, 1918, he was again arrested and taken to England. He returned in 1919, was again arrested and deported. Upon his return to Dublin this last time, he became Minister of Local Government in the Dail Eireann. In January, 1922, he put through a plan to spend £1,000,000 on housing within the year. On the death of Arthur Griffith and of Michael Collins, Cosgrave became head of the Provisional Government and when the Irish Free State was constituted in December, 1922, was elected president of the Executive Council. He was also Minister of Finance (1922-23) and Minister of Defense, 1924. Cosgrave favored financial help for the peasants so that they might change their status from tenants to peasant proprietors. He represented the Irish Free State at Geneva when it was admitted to the League of Nations (1923). The entrance of the de Valera republicans into the Dail in 1927 reduced his majority to one and a new election was held in which he retained power by a small margin. See IRELAND, under *History*.

**COSMIC RAYS.** See **PHYSICS**.

**COSMOGONY.** See **ASTRONOMY**.

**COSSIO, MANUEL BARTOLOME** (1858- ).

A Spanish humanist, art critic, and educator. Born in Haro (Logroño), he studied law and earned his doctorate at the University of Madrid. He was professor of the theory and history of art in the School of Fine Arts at Barcelona; professor of pedagogy in the University of Madrid; director of the National Pedagogical Museum of Madrid; professor in the School of Criminology; and director of the Institución Libre de Enseñanza. His study, *El Greco* (2 vols., 1908), is his most important work.

**COSTA RICA**, kō's'ta rēk'a. A Central American republic situated between Nicaragua and Panama. Its area is variously estimated at 18,691 to 23,000 square miles. According to the census of 1927, the population was 471,524. Immigration in 1926 was 6402 (1911, 9537) and the emigration, 5894 (1911, 8170). The populations of the largest cities, according to the census of 1927, were: San José, with suburbs, 50,580; Cartago, 14,883; Heredia, 7631; Alajuela, 8496; Limón, 15,624.

**Industry and Finance.** Agriculture continues to prosper. In 1913 exports of coffee totaled 13,019,059 kilos, at a value of \$3,605,930; in 1927, 35,539,000 pounds, at \$10,611,000. In 1913 Great Britain took 82 per cent of the total; the United States, 6 per cent. During the World War, the United States displaced Great Britain from her commanding position, only to be compelled to yield up first place once more in 1922, when she bought 34 per cent, and Great Britain, 59. The banana industry, worked for the most part by the United Fruit Company, ranked second in importance in point of export value. In 1912 the number of bunches shipped was 10,647,702; in 1927, 7,853,000. Production was decreased somewhat after 1923 by blight. Cacao production has assumed economic importance. Exports in 1913 were 845,931 pounds; in 1927, 7,544,000. Mining, on the other hand, decreased because of the exhaustion of the known

ore bodies. Exports of gold and silver bullion for 1905-14 were worth an annual average of \$706,457; in 1927, \$506,000. Commerce over the whole period showed imports of \$8,687,280 for 1913; for 1927, \$16,311,000; exports for 1913 and 1927, \$10,234,149 and \$18,058,000. In 1912, 46 per cent of the imports came from the United States; in 1927, 50.3 per cent. Exports to the United States decreased from 55 per cent to 32.9 per cent in 1927. They had reached 68 per cent in 1921. The year 1922 was the first to show a surplus since 1912. Expenditures in 1913 were 10,184,261 colones; in 1922, 17,311,165 colones, in 1927, 23,319,189 colones. Revenues for the same years were 9,612,533, 18,971,023, and 30,584,123 colones. On Dec. 31, 1927, the public debt was 80,047,942 colones. The par value of the colon is \$0.465 (2.15 colones to the dollar). In 1922 the colon was worth 4.4 to the dollar, so that the Government was compelled to fix the legal rate of exchange, in October, 1922, at 4 colones. During 1923 there was a fluctuation in value, the colon going as high as 4.54 to the dollar, but the exceptionally good coffee crop and high prices of 1924 increased the gold exchange and made possible the regulation of the rate at 4 colones again. It remained stable at that rate down through 1928.

**History.** President Alfredo González, elected in 1914, was confronted by serious disturbances in 1917 on his attempt to inaugurate a radical financial programme and was compelled to relinquish his office. His successor, Federico Tinoco, leader of the revolutionists, was refused the recognition of the United States, with the result that his waning influence ended with his overthrow in 1919 at the hands of Julio Acosta García. The latter served as President, 1920-24, and during his administration the country regained the stability for which it had formerly been celebrated in Spanish America. Under a small and satisfied landowning class, prosperity prevailed. In 1917 Costa Rica severed relations with Germany and in 1918 assumed the rôle of an Associate Power on the side of the Allies. In 1920 the suffrage was extended to women. In 1921 the administration was thwarted in its attempt to join the newly-formed Central American Union by the negative vote of the National Assembly. (See **CENTRAL AMERICAN UNION**). In August, 1921, Costa Rica came near to open hostilities with Panama when that country refused to recognize an arbitral award of disputed territory to Costa Rica. In 1923 Secretary of State Hughes announced that it was the intention of the United States to recognize Costa Rica's rights in the use of the San Juan River for the Nicaraguan Canal route. The question had arisen out of Costa Rica's protest against the Bryan-Chamorro Treaty of 1916 and her subsequent suit before the Central American Court of Justice, on the ground that the route, in being run through the San Juan River, alienated her territorial rights. For the presidential term 1924-28, Ricardo Jiménez was elected in May, 1924. His administration saw continued growth in prosperity for the country, enabling it to reduce materially its foreign debt, establish a farm loan bank, build sewerage systems for many towns, build roads, bridges, etc., and improve schools. In 1928 Cleto Gonzales Viquez, leader of the National Party, was elected President for the term beginning May 8. He had been President once before, from 1906 to 1910. On Jan. 22, 1925, Costa Rica gave notice of with-

drawal from the League of Nations. According to report, she was offended at criticism for failure to pay her dues. Full payment of all dues accompanied the withdrawal notice. In 1928 a note from the League urged that Costa Rica should again become a member. In reply Costa Rica attracted world attention by requesting a definition of the Monroe Doctrine. In September, 1928, it was announced that Costa Rica had decided to rejoin the League.

**COSTIGAN, JOHN EDWARD** (1888- ). An American figure and landscape painter, born at Providence, R. I., and self-taught in art. He was awarded the Peterson Purchase Prize of the Chicago Art Institute in 1922, the Kremer Purchase Prize of the International Water Color Exposition in 1923, the Shaw \$1000 Purchase Prize of the Salmagundi Club (N. Y.) in 1924, the Tuthill Purchase Prize of the International Water Color Exhibition at the Chicago Art Institute in 1924, the National Arts Club Prize (N. Y.) in 1925, the Saltus Medal of the National Academy of Design in 1925, and the Clark \$300 Prize of the National Academy of Design in 1927. He became an associate of the National Academy in 1924.

**COST OF LIVING IN THE UNITED STATES.** The cost-of-living index numbers given by the United States Bureau of Labor Statistics show the changes in the cost of living throughout the United States during 1914-28 in comparison with the average cost in 1913. Retail prices of food are secured directly from 15 to 25 dealers in each of 51 cities and prices are also secured for coal, wood, gas, electricity, and kerosene from dealers in a number of cities. Other data on retail prices are secured by special agents. Rental figures are for 400 to 2000 houses and apartments in each city, according to its population. The costs of clothing, furniture, and miscellaneous items are determined from four quotations from each city on each of a large number of items; in Greater New York, five quotations were secured instead of four. In the calculation of the index number, the prices for the different articles of food are weighed according to the relative values shown in the budgets of over 12,000 families examined by the Federal Bureau of Labor Statistics in 1918-19.

As compared with the average for 1913 as 100.0, the cost of living for the whole United States varied widely for the period being reviewed. In December, 1916, the index had reached 118.3; a year later, it was 142.4; in December, 1918, it was 174.4. The high point was reached in June, 1920, when the index was 216.5. From thence on, the index receded slowly, dropping to 180.4 in May, 1921, and to 166.3 in September, 1922. Between that month and June, 1923, the range was never wide, being from 168.8 for March, 1923, to 175.6 for December, 1926. In June, 1923, the index was 170.0, and in December, 1923, 171. Over the period, June, 1920-December, 1928, the decrease averaged 20.9 per cent. In some cities, the decrease was even greater. In Detroit, it was 24.8 per cent; in Kansas City, 26.3 per cent; in Portland, Oreg., 24 per cent; in Savannah, 24 per cent.

The tables on pages 400 and 401 show that there were marked differences in the rates of increase in the six budget divisions. Over 1913 the cost of food increased 26 per cent in 1916 and 78 per cent in 1920. By December, 1921, the increase had dropped to 49.9 per cent only

to mount again slowly to 66.5 per cent in December, 1925. In June, 1923, food cost 52.6 per cent more than it had in 1913. Clothing showed even greater variations. In December, 1918, clothing cost 105.3 per cent more than it had in 1913; in December, 1920, it cost 158.5 per cent; and then the cost of clothing began to drop sharply, so that by June, 1923, the increase over 1913 was only 62.6 per cent. The cost of housing showed the same wide fluctuations, in December, 1920, being 51.1 per cent greater than in 1913 and a year later, 61.4 per cent. This item of the household budget mounted until it reached 68.2 per cent in December, 1924, only to recede slightly in the following years; so that, with the renewal of building activities, the increase in June, 1928, over the 1913 figure was 57.6 per cent. It will be observed by reference to the table that the trend of costs for fuel and light showed something of the same variations as in the case of housing.

In addition to the cost-of-living index number for the United States, the Bureau of Labor Statistics published data on the change in the cost of living in 19 cities where comparison could be made with prices prevailing in December, 1914. Each of these index numbers is weighed according to the proportionate expenditures for the different budget divisions shown by the budgets collected in the city by the Bureau during 1918-19. The food expenditure, however, is weighed according to the average expenditure shown in all budgets collected in the geographical division in which the city is located. As will be seen by reference to the accompanying table, there is considerable variation among the cities in the amount of change in the total cost of living. In all instances, living costs increased slowly at first and then more rapidly, until the highest point was reached in June, 1920. The decrease was fairly rapid until 1922 and from thence on the fluctuations were within a fairly narrow range. It is interesting to observe the differences existing among the individual cities in June, 1928. Buffalo appeared the most expensive city to live in, with Detroit, Cleveland, and Philadelphia following. Portland, Oreg., was the cheapest. In fact, on the basis of increases over 1914, the cost of living in Buffalo was more than 50 per cent greater than in Portland.

It is interesting to compare the trend in the cost of living in the United States with costs in various foreign countries since 1913. The index numbers are based upon the cost of food, clothing, fuel and light, rent, house furnishings, etc., with certain variations. These data, presented in Table II on page 401, show that while the cost of living in the United States and in Ireland rose in the same ratio—from 100 in 1913 to 170 in June, 1928—the increase was considerably less in Canada and Germany and much greater in Finland, Czechoslovakia, Italy, and France. In Finland, the cost of living increased from 100 in 1913 to 1212 in June, 1928; in Prague, capital of Czechoslovakia, from 100 to 736; in Milan, Italy, from 100 to 526; in Paris, France, from 100 to 507. The index figure for Denmark was 176 in June, 1928, and for Belgium, 204. The cost of living reached its peak in the United States, Canada, and Denmark in 1920, but continued to rise in most of the other European countries until 1926 or 1927. See also **WAGES**.

COTARELO Y MORI, EMILIO (1857- ). A Spanish literary historian and critic. He studied law at the University of Oviedo, receiving the doctorate in 1877. Devoting himself at once to literary pursuits, he was elected a member of the Spanish Royal Academy of the Language, of which, a few years later, he became perpetual secretary. His specialty is the history of the drama. Among his most important publications are *El Conde de Villamediana* (1886); *Tirso de Molina* (1893); *Vida y obras de D. Enrique de Villena* (1896); *Estudios sobre el arte escénico de E. María del Rosario Fernández*; *La Tirana* (1897); *Don Ramón de la Cruz y sus obras* (1899); *Estudios de historia literaria* (1901); *Sobre el origen y desarrollo de la leyenda des los Amantes de Teruel* (1903); *Las armas de los Girones* (1903); *Bibliografía de las controversias sobre la licitud del teatro en España* (1904); and a historical novel, *El hijo del Conde-Duque* (1912).

COTTON. The cotton situation of the world, in 1929 was unsatisfactory from almost every standpoint. As a result of recent investigations new industrial uses for cotton have been developed and the quantity required for automobile tires, artificial leather, pyroxylin, which has many uses, etc., is very large. This new demand,

coupled with diminishing world supplies of cotton, has made it difficult if not impossible for spinners and weavers to keep their spindles and looms fully employed. On the other hand, the growers of cotton in many countries have been hard put to produce their crop at a profit on account of insects, diseases, unfavorable climatic, soil, and labor conditions, and in some cases, lack of adequate transportation. The maximum world's production of cotton was attained in 1926 when a crop of 27,812,000 bales was marketed. The production statistics of all countries except the United States is given in bales of 478 pounds, and for the United States, running bales which average a little more than 500 pounds each. Of this total, 17,755,000 bales, or nearly 64 per cent, was produced in the United States. In 1928 the estimated world's production of commercial cotton was 25,751,000 bales, of which 14,296,549 bales, or about 55½ per cent, was grown in the United States. Following the year 1920, there was a surplus of commercial cotton for a few crops and there was a large carry-over, but reduced production and growing demand had so drawn upon the reserve that for some purposes there was a deficient supply. This was shown in the greatly depressed condition in the spinning centres of many countries.

**Boll Weevil and Pink Bollworm.** In certain parts of the United States, the reduced production was due to a number of causes, the principal of which is the boll weevil, *Anthonomus grandis*. The boll weevil, which is a native of Central America and Mexico, made its appearance near Brownsville, Tex., about 1892. It advanced toward the north and east at an average rate of about 100 miles a year until in 1923 practically all the old cotton belt from Texas and Oklahoma to North Carolina was infested. So severe were its ravages that the production of upland cotton was greatly curtailed and the crop of Sea Island cotton was reduced from a maximum of 119,000 bales in 1911 to less than 1000 bales in 1923. For several years, no commercial Sea Island cotton has been produced in the United States. The presence of the boll weevil necessitated the adoption of modified methods of growing the crop that materially increased its cost. Early maturing varieties are more extensively grown, and heavy applications of fertilizers are recommended to hasten the maturity of the crop. Poisoning the weevils with calicum arsenate has been extensively adopted and more than 1,000,000 pounds of this material were employed in 1923. Where the land is sufficiently fertile to produce at least half a bale to the acre, the use of calicum arsenate has proved very profitable. Dusting from airplanes has been successfully developed. By the combination of these methods, it has been found entirely practicable to grow cotton in regions of heavy boll-weevil infestation.

The pink bollworm, *Pectinophora gossypiella*, a serious menace to cotton growing, appeared about 1916 in Louisiana and Texas, having probably been introduced from Mexico. It was eradicated by 1918 through cleaning all fields, gins, and seed mills, and by the establishment, surrounding the infested areas, of zones in which no cotton was grown. In 1927 it again was found in west-central Texas and the same measures have been put in force for its control. In the meantime, the pink bollworm has become established in the Lower Rio Grande Valley in New Mexico, where it is a menace to cotton growing in other districts. Quarantine measures have been adopted to prevent its spread. See ENTOMOLOGIST, ECONOMIC.

**Distribution of Production.** There was a very considerable extension of the cotton area of the United States after 1914. Arizona and California became important producers of cotton, with a production in 1923 of more than 132,000 bales. In Arizona, the industry was largely built up around strains of Egyptian cotton, and in 1920 the production of Egyptian-American cotton was in excess of 100,000 bales. This cotton is of a special type, having very long and fine lint, and it is suited to special manufactures. The overproduction in 1920 resulted in a fall in price and a reduced planting of these varieties. In 1927 only 24,223 bales of this type of cotton were grown, while there was a decided increase of short-staple cotton both in Arizona and in California.

There has been a remarkable extension of cotton growing in the plateau region of northwestern Texas. Extension areas suited to the crop, large fields that permit of machine cultivation, mechanical methods of harvesting, and freedom from boll-weevil injury, all favor cotton production in this region. In 1927 in 13 counties of northwestern Texas, over 150,000 bales

of cotton were produced where there was no commercial crop of cotton in 1922.

In Egypt, one of the great cotton-producing countries, there was a steady decline in the yield of cotton per acre, and although there was a large area brought under cultivation by the construction of the great Assuan Dam, the total production of cotton showed little increase. Several commissions studied the situation and the reduced production per acre was attributed to various causes, among them changed cultural methods, rise of water table due to overirrigation, extensive planting of varieties of low production but yielding fine lint, and the spread of pests, especially the pink bollworm. The Egyptian government limits the area to be planted in cotton, supervises the crop, its marketing, etc.

For many years, Great Britain has been the greatest consumer of cotton, about 35 per cent of all the spindles devoted to cotton spinning being in that kingdom. In order to make English spinners less dependent upon the United States for supplies of cotton, an active campaign was started to increase the growing of cotton within the British Empire. In 1902 there was organized the British Cotton Growing Association. In 1919 the Empire Cotton Growing Corporation was chartered and supported by contributions from the Government and by a tax of 6d. per bale on all cotton imported into and spun in the United Kingdom. Through the activities of these organizations, the growing of cotton has been stimulated in many parts of the British Empire. In some countries, subsidies have been granted to growers, gins have been erected, experiment stations and seed farms established, and irrigation works constructed, all with a view to increasing cotton production. While no large amounts of cotton were added to the world's production, the possibilities of successful cotton growing in some countries seemed assured. Empire-grown cotton, exclusive of India, in 1926-27 amounted to 361,318 bales, as compared with 84,522 bales in 1918-19. Parts of Africa, particularly the Sudan, Uganda, and Nigeria, were considered very promising. In Australia, the climate and soils appeared favorable, and it was believed a profitable industry could be built up. Efforts were being made to improve the cotton situation in India, and a fund derived from a tax of 4 annas (about \$.08.) a bale on all cotton grown in the country was devoted to research in the cotton industry. This tax was reduced to 2 annas in 1926. Brazil had a 1927 crop estimated at 492,000 bales. An international commission visited Brazil in 1922 and reported favorably on the possibilities for cotton growing and suggested means whereby production might be greatly increased.

Although active efforts were made by European agencies to increase the production of cotton in order that there might be larger supplies for the old spinning centres, there has been a rapid expansion of spinning in new territories and it is considered doubtful whether the desired object will be attained. Japan, reporting more than 6,200,000 spindles in 1928, became an important consumer of raw cotton. In Brazil, as cotton production has increased, manufacturing it into yarn and cloth has grown. India is consuming more of its crop in domestic manufactures and the exports are not increasing very appreciably.

In February, 1924, there were in the United States 37,742,000 spindles, an increase of about 15 per cent since 1914, indicating a material increase in cotton consumption within the country. In February, 1929, there were in place 35,327,824 spindles, of which 31,007,936 were active. There was a decided movement of cotton spinning toward the cotton-growing States, and while there were still about 2,000,000 spindles more in the Northern than in the Southern States, the number of active spindles and spindle-hours per month in the cotton-growing States were greater in the South in February, 1924. In February, 1929, however, there were in the cotton-growing States 18,713,214 spindles, as compared with 15,118,014 for New England and 1,486,596 for other States. See **TEXTILE MANUFACTURING**.

**COTTON, HENRY ANDREWS** (1869- ). An American psychiatrist widely known in connection with the relief of certain forms of insanity through surgical intervention. Born in Norfolk, Va., he graduated at the Baltimore Polytechnic Institute in 1894 and took his medical degree at the University of Maryland in 1899. He studied psychiatry in Europe during 1905-07 in the laboratories of Professors Kraepelin and Alzheimer, at M $\ddot{u}$ nich. Upon his return, he was placed at the head of the New Jersey State Insane Asylum where he studied the relation of physical factors to the causation of mental disorders. In 1921 he delivered a course of lectures at Princeton on the relation of focal infection to insanity. His views and experience are set down in his book, *The Defective, Delinquent, and Insane* (1921).

**COTTON, JOSEPH POTTER** (1875- ). An American lawyer, born at Newport, R. I. He was graduated from Harvard in 1896 and from the Harvard Law School in 1900. After 1915, he served as counsel to the New York Commission on Workmen's Compensation, and was consulting counsel of the Federal Reserve Board and of the United States Shipping Board. He was chief of the meat division, United States Food Administration, in December, 1917, and in the following year was European representative of the Federal Food Administration. He was also a member of the Inter-Allied Finance Council. In 1929 he was appointed Under Secretary of State. He edited *Constitutional Decisions of John Marshall* (1906).

**COTTON, MANUFACTURES OF.** See **TEXTILE MANUFACTURING**; also **COTTON**, above.

**COTTON-BOLL WEEVIL.** See **ENTOMOLOGY, ECONOMIC**.

**COTTRELL, FREDERICK GARDNER** (1877- ). An American chemist (see **VOL. VI**). During 1920-21 he was director of the United States Bureau of Mines, and also chairman of the Division of Chemistry and Chemical Technology of the National Research Council. Since 1922 he has directed the Fixed Nitrogen Research Laboratory, U. S. Department of Agriculture.

**COTTRELL PROCESS.** The Cottrell process for precipitating fine particles of solid matter in smoke, gases, and furnace fumes is very widely applied in American metallurgical plants. It recovers material of very great value, as in metal smelters, and greatly reduces smoke and fumes exhausted from chimneys. The process consists of passing the fumes between two conductors maintained at a unidirectional difference of potential of from 50,000 to 100,000 volts.

For this purpose, high potential alternating voltages are rectified by means of a mechanical rectifier or more recently by means of a hot cathode two-electrode vacuum tube known as a kenotron.

**COUÉ KOUA, ÉMILE** (1857-1926). A French mental healer and hypnotist, born at Troyes, France. At 19, he became an apprentice in a pharmacy, and at the end of three years went to Paris and took his Ph.D. in Pharmacy, helping to pay his way by winning a competition for a government fellowship of 1200 francs a year. Later, a druggist at Troyes offered him a partnership, and when the druggist died shortly thereafter, he left the store to his young partner. Coué became a hypnotist, then an auto-suggestionist, and had a sanitarium where he practiced without charge to his patients. After a somewhat sensational career in France and England, he came to the United States early in 1923 and held many clinics in New York City and throughout the country. Coué's theory was that the subconscious mind, trained by repeating many times each day: "Every day in every way I am getting better and better," will direct the diseased organ to do the thing that will make it better. He described his theories and methods in a book entitled, in the English translation, *Self-Mastery by Conscious Autosuggestion*.

**COULTER, JOHN LEE** (1881- ). An American statistician and college president (see **VOL. VI**). During 1917 and 1918, he was an expert for the National Exports Council and the War Industries Board. He was with the Army Overseas Educational Commission during 1918 and 1919. Since 1921 he has been president of the North Dakota Agricultural and Mechanical College.

**COULTER, JOHN MERLE** (1851-1928). An American botanist (see **VOL. VI**). Professor Coulter remained head of the department of botany of the University of Chicago until 1925. For the last three years of his life, he was adviser to the Boyce Thompson Institute of Plant Research at Yonkers, N. Y. and during 1923-28 he was a member of the National Research Council. He wrote *Plant Genetics* (1918), and (with Merle C. Coulter), *Where Evolution and Religion Meet* (1924).

**COULTON, KÖL'-tūn, GEORGE GORDON** (1858- ). A British historian who was university lecturer in English at Cambridge. He was educated at the Lycée Impérial, St. Omer, Felstead School, St. Catharine's College, Cambridge, and at Heidelberg, and after being assistant master at Sherborne, Sedbergh, and Dulwich, he became Birbeck Lecturer in ecclesiastical history at Trinity College, Cambridge. He was a Fellow of St. John's College, Cambridge, and an honorary Fellow of St. Catharine's. His books, written in a brilliant and appealing style, include *Chaucer and his England* (1908); *The Main Illusions of Pacifism* (1916); *The Case for Compulsory Military Service* (1917); *Social Life in Great Britain from the Conquest to the Reformation* (1918); *Five Centuries of Religion*, the 11th to the 16th: Vol. I, *St. Bernard* (1923), Vol. II, *Tradition* (1927); *The Death Penalty for Heresy from 1184 to 1921 A.D.* (1924); *The Medieval Village* (1925), and *Art and the Reformation* (1928). He edited *Cambridge Studies in Medieval Life and Thought*, writing two studies himself: *The Monastic Legend* (1905) and *Priests and People* (1907), and he also edited *Democracy and Military Service* which

was an abbreviated translation of the *Armée Nouvelle*, by Jean Jaurès (1916).

**COUNTY, ALBERT JOHN** (1871- ). An American railway official, born in Dublin, Ireland. He entered the railway service with the Great Southern & Western Railway of Ireland, in 1885. Removing to the United States, he became clerk in the secretary's department of the Pennsylvania Railroad, and in the years following served in various important capacities with that road and with its subsidiary lines. In 1916 he was appointed vice president in charge of accounting and in 1925 vice president in charge of the treasury and corporate work of the Pennsylvania and affiliated roads. He was also director and president of most of the branch and affiliated lines of the Pennsylvania Railroad Company, an official and director in many important financial institutions and a member of many learned societies.

**COUPERUS, LOUIS** (1863-1923). A Dutch novelist, born at The Hague, where he was educated. His youth was spent in Batavia, Greece, Italy, and the South of France. His publications began to make an impression in foreign countries as early as 1891, when *The Footsteps of Fate* was published in England. His first venture was a volume of verse, *Ben Lent van Vaerzen* (1884), but after the publication of *Orchideeën* (1887), he wrote only fiction. The first to be rendered into English by the official translator of his works, Alexander Teixeira de Mattos, was a short love story entitled *Ecstasy* (1891), which appeared in the United States in 1919. This was followed by English versions of *Majesty*; *Universal Peace*; *Psyche*; *Fidessa*; *Babel*; *God and the Gods*; and a series of four novels entitled "Books of the Small Souls" (1914-18), namely, *Small Souls*; *The Later Life*; *The Twilight of the Souls*; and *Dr. Adrian*. He also published at intervals historical novels which reflected his researches in the Greek and the Italian past, including *The Mountain Light*, a study of the emperor Heliogabalus, and *The Comedians* (*De Komodianten*, 1906), which deals with two young actors in the reign of Domitian. Another, *The Tour*, of which the scene is laid in Egypt in the reign of Tiberius, was published in the United States in 1920. His other historical romances are *Abu-Abdallah the Unfortunate*; *The Flying Chessboard*; and *Xerxes or Pride*. He also wrote two mythological romances, *Dionysus and Heracles*; *Old People and the Things that Pass*, issued in the United States in 1919, and *The Law Inevitable* (1921). In addition, he published volumes of travelers' impressions, sketches, short stories, and a number of novels whose scenes are laid in the Dutch East Indies. After his death, *Eastwards* (1924) and *Nippon* (1926), books of travel, were published.

**COURLAND.** See BALTIC PROVINCES; LITHUANIA; LATVIA.

**COURTELINE, GEORGES** (1860- ). The pseudonym of Georges Moineaux, a French humorist, writer of novels, stories, and short plays. He was born in Tours and educated at the Collège de Meaux. He was a member of the Goncourt Academy. Among his many works are *Les gâtées de l'escadron* (1886); *Le train de 8 h. 47* (1888); *Messieurs le ronds-de-cuir* (1893); *Boubouroche*, perhaps his best work (1893); *La voiture versée* (1898); *L'Article 330* (1900); *La conversion d'Alceste*, a continuation of Molière's *Misanthrope* (1905); *La cruche . . . ou*

*J'en ai plein le dos de Margot* (1911); *Les Boulingrin* (1914), and *Une lettre chargée*. In 1918 his *Théâtre* was published in two volumes, and in 1919 *Le miroir concave*, another collection of plays. He wrote many in collaboration with others, the most famous being Catulle Mendès, with whom he wrote *Les joyeuses commères de Paris*, music by Rabuteau and Pierné (1892). Consult *Georges Courteline*, by R. Le Brun (1906) or by Beatrice Elliott (1928), the latter being selections to show the many-sidedness of his work, and *La Philosophie de Georges Courteline* (1917).

**COURTENAY, WILLIAM** (1875- ). An American actor born at Worcester, Mass., who attracted notice first as a member of the late Richard Mansfield's company. He played in various places in the United States and made his most notable recent successes in: *Under Fire* (1915); *Pals First* (1917); *General Post* (1917); *The Maid of the Mountains* (1918); *Cappy Ricks* (1919); *Civilian Clothes* (1920); and *Honors Are Even* (1921). In 1924 he played Roland Valetti in *The Harem*.

**COURT OF INDUSTRIAL RELATIONS.**

See LABOR ARBITRATION; KANSAS.

**COURT TENNIS.** See TENNIS.

**COUSE, E(ANGER) IRVING** (1866- ). An American painter (see VOL. VI) whose specialty is the portrayal of Indian life. He has won many prizes for his Indian paintings including a silver medal from the Panama-Pacific International Exposition (1915), the Altman Prize from the National Academy of Design (1916), Isidor Prize from the Salmagundi Club (1917), the Ranger Fund Purchase Prize from the National Academy of Design (1921), and the Lippincott Prize from the Pennsylvania Academy of Fine Arts (1921).

**COUZENS, JAMES** (1872- ). A United States Senator, born at Chatham, Ontario, Can., and educated in the public schools. In 1903 he began the manufacture of automobiles in Detroit, Mich., becoming closely associated with Henry Ford (q.v.) in that industry (1903-15). He was vice president, general manager, and treasurer of the Ford Motor Company. Differing sharply with Ford on issues in connection with the World War, he resigned from the organization. Having been commissioner of the Detroit police department and commissioner of street railways, he was elected Mayor of Detroit (1919-22). Appointed by Governor Groesbeck to complete the unexpired term of Truman S. Newberry as United States Senator (1922-25), he was elected for the succeeding term (1925-31). He has been chairman of the Senate Committee on Education and Labor and a member of the Interstate Commerce Committee.

**COVENEY, CHARLES CARDEN** (1874- ). An American architect born in Boston. He received his professional training in an architect's office and during travel in Europe. His principal architectural achievements are the Christian Science Church and the Burrage residence in Boston, the Memorial Church in Fairhaven, Mass., and the Messiah Home in New York. He has specialized in church architecture and has been an active worker in the Protestant Episcopal Church.

**COWARD, NOEL** (1899- ). A British actor, playwright, and composer, who was born at Teddington, England. At ten he left Croydon School to begin his career as an actor in a village fairy play. By 1917 he had written *The*

*Last Track*, and was acting his first important part. After serving in the army (1918), he played Bobbie in *I'll Leave It To You*, his first successful play (1920), and the next year made a trip to America, where his efforts to market his three plays were in vain. In London, *Young Idea* was a success, as were his sketches for revues, notably *Charlot's*, as well as his acting in this field. London producers were eager to stage *The Vortex*, written in five days, but not with the author in the part of Nicky Lancaster—so, financed by Michael Arlen, Coward played and produced it successfully (1924), and brought it to New York (1925). Also produced in New York were *Hay Fever*, a failure (1925), *Easy Virtue* (1925), *This Was a Man* (1926), *Fallen Angels* (1927), *The Marquise* (1927), and *This Year of Grace*, a musical revue, starring Beatrice Lillie and the author (1928). Other plays, produced only in London, were *The Rat Trap*, *On With the Dance*, a revue, *The Queen Was in the Parlour*, *Home Chat*, and *Sirocco*, a complete failure. On the whole, his dialogue is clever, his instinct for effect good, and there is continual action in his plays.

**COWL, JANE** (maiden name Cowles) (1887- ). An American actress, born in Boston. She began her stage career as an extra girl, one of her early small parts being in *The Music Master*. She had her first big leading rôle in David Belasco's production, *Is Matrimony a Failure*, and then she played stock. This was followed by *The Gamblers*, her first great success, and by *Within the Law*, *Common Clay*, and other successes. She turned her attention to playwriting also, and wrote *Daybreak* with Jane Murfin, then *Lilac Time and Information, Please*. Her most notable triumph has been *Juliet*, in *Romeo and Juliet*, which she played in 1923 and 1924. She began to study this rôle when she was 13, and her interpretation of her part was given great praise. She appeared also in *Peléeas and Mélisande*, in *Antony and Cleopatra* (1923); in Noel Coward's *Easy Virtue* (in the United States and England, 1925-26); and in *The Road to Rome* (1927-28).

**COWLEY, ARTHUR ERNEST** (1861- ). An English Hebrew scholar (see VOL VI). He was made librarian of the Bodleian Library, Oxford, in 1919. His later works included *Jewish Documents of the Time of Ezra* (1919); *The Hittites* (1920); *Aramaic Papyri of the 5th Century B. C.* (1923); and *Catalogue of Hebrew Printed Books in the Bodleian Library* (1922).

**COWLING, DONALD JOHN** (1880- ). An American university professor and college president, born at Trevalga, Cornwall, England. He was brought to America by his parents in 1882 and was educated at Lebanon Valley College, Yale and Baker universities. He received the honorary LL.D. degree from Knox, Williams, and Oberlin colleges. After teaching philosophy at Baker University, he became, in 1909, president of Carleton College. Dr. Cowling was a leader in religious education, and was trustee of the Congregational Foundation for Education and of the Chicago Theological Seminary. In 1918 he was president of the Association of American Colleges and in 1919 served on the American Council on Education.

**COWS.** See DAIRYING; LIVE STOCK; VETERINARY MEDICINE.

**COX, HAROLD** (1859- ). An English editor and economist (see VOL VI). He was a member of the Committee on Public Retrench-

ment (1916), and of the Royal Commission on Decimal Currency (1919). He published *Economic Liberty* in 1920, and *The Problem of Population* in 1923.

**COX, JAMES M (IDDLETON)** (1870- ). An American governor and newspaper publisher (see VOL VI). He was Governor of Ohio for the terms 1913-15, 1917-19, and 1919-21. In 1920, he was Democratic nominee for President of the United States, but was defeated by the Republican candidate, Warren G. Harding. He bought the Miami *Metropolis* (Miami, Fla.) and the Canton *News*, Canton, O., in 1923.

**COX, SIR PERCY ZACHARIAH** (1864- ). A British diplomat and colonial administrator, who was educated at Harrow and Sandhurst. After a few years in the British Army, he was appointed to the Indian political department, and acted as consul on the Somali Coast, at Berbera, in Arabia, and on the Persian Gulf. He was secretary of the foreign department of the Government of India in 1914 and acting British Minister to Persia, 1918-20. His administration of Iraq as high commissioner (1920-23) covered the transition from military rule through a provisional government to the time when Feisal, a son of the King of the Hedjaz, was made King by the British in 1921. In 1924 he was the British plenipotentiary in the negotiations over the Turko-Iraq frontier, and in 1925 he was India's plenipotentiary at the Geneva conference for framing a convention for control of the arms traffic.

**COXE, WILLIAM BRISCOM** (1869-1927). An American marine engineer, born in Reading, Pa. He received his engineering education in Germany and for several years was with a marine construction company in Scotland. He acted as foreign representative and assistant general superintendent for the Cramp Shipbuilding Company from 1898 to 1904, and built for them several large battleships for Russia and other countries. He was president and official in many shipbuilding and engineering corporations. During the Spanish-American War he served as lieutenant in the United States Navy and from 1917 to 1920 was district manager of the Emergency Fleet Corporation, Delaware River District. He was president of the Atlantic Coast Shipbuilders' Association from 1917 to 1920.

**CRACKING OF PETROLEUM.** See CHEMISTRY; PETROLEUM.

**CRAFTS, WILBUR FISK** (1850-1922). An American clergyman (see VOL VI). He was United States delegate to the Purity Congresses in 1915, 1916, and in the same years was a member of the Union National Commission to frame an amendment for Constitutional Prohibition. In 1917 he became a member of the Presbyterian Social Service Commission and of the United States Committee of War-time Activities. At the time of his death, he was superintendent of the International Reform Bureau at Washington, D. C. Among his later works are *The Bible in School Plans in All Lands* (1914); *Bible Stories and Poems* (1914); *Dress Reform* (1918); *Why Dry? Briefs for Prohibition, Local, State, National, and International* (1918, 1919); *Made in Mayflower Land* (1920); *That Boy and Girl of Yours, and Other Addresses* (1921).

**CRAIG, AUSTIN** (1872- ). An American historian, born at Eddytown, N. Y., and educated at Cornell University, the University of

Rochester, and Pacific University, Oreg. He was a school superintendent in Oregon from 1895 to 1898, when he began the practice of law. In 1904, he entered the Philippine Civil Service. He was assistant professor and Rizal research professor of history in the University of the Philippines, 1912-22, and professor of history in the University of Manila (1922-27). His works include *The Story of José Rizal* (1909); *Los Errores de Retana* (1910); *The Lineage, Life and Labors of José Rizal* (1912), and *The Story of the Philippine People* (1919). He also edited the following: *The Rizal Translations* (1912-14); *Pre-Spanish Philippine History, A. D. 48-1521* (1915); *The Former Philippines through Foreign Eyes* (1915); *The Beginnings of Philippine Nationalism* (1916); *Famous Filipinos* (1916); *Rizal's Own Story* (1919); *The Filipinos' Part in the Philippines' Past* (1921); *Rizal's Life and Minor Writings* (1927).

**CRAIG, kräg, CHARLES FRANKLIN** (1872- ). An American bacteriologist (see VOL. VI). Dr. Craig was appointed curator at the Army Medical Museum in 1918, resigning to accept the chair of bacteriology, parasitology and preventive medicine at the Army Medical School, Washington, D. C. (1920-22). He served as medical inspector of the Hawaiian Department at Honolulu, 1922-26, and then returned to the Army Medical School as director of the department of preventive medicine and clinical pathology. His monograph, *The Wassermann Test*, was published in 1918. He is also the author of *A Manual of the Parasitic Protozoa of Man* (1925).

**CRAIG, EDWARD GORDON** (1872- ). An English actor (see VOL. VI). His later publications on the theatre include *The Theatre Advancing* (1921), *Scene* (1923), *Woodcuts and some Words* (1924), *Nothing, or the Book-plate* (1925), and *Books and Theatres* (1925). In 1928 he collaborated in a notable production of *Macbeth* in America.

**CRAIG, JAMES.** See CRAIGAVON, FIRST VIS-COUNT OF STORMONT.

**CRAIGAVON, FIRST VISCOUNT OF STORMONT** (1871- ). Born James Craig in County Down, Ireland, he became the first Prime Minister of Northern Ireland, an office which he has held continuously since 1921. He was educated at Merchiston and served in the South African and World Wars. Entering politics in 1903, he was elected to Parliament as an Ulster Unionist in 1906 and was returned regularly until 1921. He was parliamentary secretary to the Ministry of Pensions in 1919-20, and parliamentary and financial secretary to the Admiralty in 1920-21. He was created a baronet in 1918 and viscount in 1927. Honorary degrees were bestowed upon him by Queens University, Belfast (LL.D., 1922), and Oxford (D. C. L., 1926).

**CRAIGIE, SIR WILLIAM A.** (1867- ). A British philologist, born in Dundee, Scotland, who has been joint editor of the English Oxford Dictionary since 1901. After studying at St. Andrews University and Copenhagen, he lectured at St. Andrews and the Taylor Institution, Oxford, and was a fellow of Oriel College, Oxford, (1917-25), and Rawlinson and Bosworth Professor of Anglo-Saxon there (1916-25). He then accepted a professorship of English at the University of Chicago. He was knighted in 1928. His works include various publications on Scottish, Gaelic, and Scandinavian subjects;

*Religion of Ancient Scandinavia* (1906); *Icelandic Sagas* (1913); *The Maitland Folio Manuscript* (1919-27); *Specimens of Anglo-Saxon Prose and Poetry* (1923-25); *The Study of American English* (1927).

**CRAM, RALPH ADAMS** (1863- ). An American architect (see VOL. VI). He was the architect of the Cathedral of St. John the Divine in New York City and supervising architect of Princeton University, for which he designed the Chapel, completed in 1928. His later works included *The Substance of Gothic* (1917); *The Nemesis of Mediocrity* (1918); *The Great Thousand Years* (1918); *The Sins of the Fathers* (1919); *Walled Towns* (1919); *Gold, Frankincense, and Myrrh* (1919), and *Towards the Great Peace* (1922).

**CRAMER, JOHN LUTHER** (1871- ). An American railway official, born in Burlington, Iowa. He was educated in the schools of that city and began his railway career with the Chicago, Rock Island & Pacific Railway as clerk, in 1883. In the years immediately following, he served in various capacities with the Montana Central and other roads in the West and Northwest. From 1889 to 1902, he was auditor of the Great Northern Railway and was assistant comptroller of the Rock Island System from 1902 to 1904. From 1904 to 1911, he was vice president and comptroller of the C. H. & D. Railway Co., and from the year 1904 on, served in various offices with the Pere Marquette Railroad Company, becoming vice president and treasurer of that company in 1920.

**CRANE, CHARLES RICHARD** (1858- ). An American business man and diplomat, born at Chicago and educated in the public schools of that city. He early entered business and from 1894 to 1914 he was vice president or president of the Crane Company of Chicago. In 1917 he was a member of the President's Special Diplomatic Commission to Russia, and in 1919 was American Commissioner on Mandates in Turkey. In 1920-21 he was American Minister to China.

**CRANE, FRANK** (1861-1928). An American journalist (see VOL. VI). His recent works include: *War and World Government* (1915); *Adventures in Common Sense* (1916); *The Looking Glass* (1917); *Christmas and the Year Round* (1917); *Dr. Frank Crane's Opinion of Astrology* (edited by F. T. Allen, 1918); *Lighted Windows* (1918); *400 Four-Minute Essays* (10 vols., 1919); *The Crane Classics* (10 vols., 1920); *Why I am a Christian* (1924); *Everyday Wisdom* (10 vols., 1927); and *Ten Ten Commandments* (1928). He also translated, with Arthur Crane, *Bhagavadgita*, or *The Battle of Life—the Ancient Poem of India* (1918).

**CRANE, WALTER RICHARD** (1870- ). An American mining engineer, born at Grafton, Mass. He was graduated in 1895 at the University of Kansas, took post-graduate courses there in 1896, and then studied at Columbia, obtaining his Ph.D. in 1901. In 1898, he became assistant professor of mining at Kansas and seven years later returned to Columbia, where he taught until 1908, when he accepted a call to the chair of mining at the Pennsylvania School of Mines and Metallurgy, also serving as dean. In 1918 he became mining engineer with the United States Bureau of Mines, in 1920 chief engineer of the War Minerals Relief Commission, in 1921 superintendent of the Southern Mining Experiment Station in Birmingham, Ala., and later

supervising research engineer for the Bureau of Mines. Dr. Crane also served on the United States Geological Survey during 1902-05. In addition to many other technical papers, he is author of *A Treatise on Gold and Silver* (1908), *Index of Mining Engineering Literature* (1909), and *Ore Mining Methods* (1910).

**CRANES, ELECTRIC.** See **ELECTRIC MOTORS IN INDUSTRY.**

**CRAPSEY, ALGERNON SIDNEY** (1847-1927). An American author and former Protestant Episcopal clergyman (see VOL. VI). Included among his later works are: *The Rise of the Working Class* (1914); *The Ways of the Gods* (1920); and *The Last of the Heretics* (1924).

**CRAVATH, PAUL DRENNAN** (1861- ). An American lawyer, born at Berlin Heights, Ohio. He was educated abroad and at Oberlin College, graduating in 1882. He graduated from the Law Department of Columbia University in 1886, and in the same year was admitted to the bar. He was advisory counsel to the American Mission to the Inter-Allied Council on War Purchases and Finance, in London and Paris, in 1918, and was awarded the Distinguished Service Medal for exceptionally meritorious service during the World War. He also received decorations from the French and Italian governments. He was a member of many legal and other societies.

**GRAVEN, FRANK** (1875- ). An American actor and dramatist who played in the United States until 1913, when he went to London in *Bought and Paid For*. He returned to the United States with his own play, *Too Many Cooks*, in which his acting established his reputation, and which he took to London in 1919. Other plays in which he has acted are *This Way Out* (his own play, 1917); *Going Up* (1917); *The Girl from Home* (1920); *The First Year* (his own play, 1920). In collaboration with George V. Hobart, he wrote *The Little Stranger*. He also wrote *Spite Corner* (1921) and *New Brooms* (1924).

**CRAWFORD, WILLIAM HENRY** (1855- ). An American educator (see VOL. VI). He was appointed National War Work Council secretary of the Y. M. C. A. in 1917 and was in France in 1917-18. In 1920 he resigned as president of Allegheny College, becoming president emeritus. He is the author of *The American College* (1915).

**CREDIT, COÖPERATIVE.** See **COÖPERATION.**

**CREDIT BANKS.** See **AGRICULTURAL CREDIT.**

**CREDIT UNIONS.** See **COÖPERATION.**

**CREEL, GEORGE** (1876- ). An American editor and author, born at Blackburn, Mo., and educated in the public schools. From 1899 until 1913, he was successively editor of the *Kansas City Independent*, the *Denver Post* and the *Rocky Mountain News*. In 1917-19 he was chairman of President Wilson's Committee on Public Information. His works include: *Quatrains of Christ* (1904); *Children in Bondage* (1913); *Wilson and the Issues* (1916); *Ireland's Fight for Freedom* (1919); *How We Advertised America* (1920); *The War, the World, and Wilson* (1920); *Police Commissioner Enright Replies to His Critics* (1921); *Uncle Henry*; *The People Next Door* (1926); *Sons of the Eagle* (1927); and *Sam Houston* (1928).

**CREIGHTON, JAMES EDWIN** (1861-1924). An American philosopher. Both as editor of the *Philosophical Review* and as professor at the Sage School of Philosophy (Cornell Uni-

versity), he continued to exercise a strong influence in the direction of idealism. On the occasion of the twenty-fifth anniversary of his service to philosophy, a testimonial volume of essays was published by former pupils of the Sage School (1917).

**CREWE, KROO, ROBERT OFFLEY ASHBURTON CREWE-MILNES, FIRST MARQUIS OF** (1858- ). A British diplomat and public official (see VOL. VI). He was Ambassador to Paris (1922-28). He was again lord president of the Council (1915-16), and was president of the Board of Education (1916), and chairman of the London County Council (1917).

**CREWS, LACRA HOPE** (1880- ). An American actress born in San Francisco, who made her first appearance on the stage as a child. She appeared later in stock and played with Frances Starr. Her later characterizations, which have been among her best, include Mrs. Deane in *Peter Ibbetson* (1917); Mrs. Sherman Fessenden in *On the Hiring-Line* ("The Wrong Number," 1919); The wife, in *Tea for Three* (1920); Olivia in *Mr. Pim Passes By* (1921); Dora Taber in *The Changelings* (1923).

**CRICKET.** Cricket, primarily a British sport, is attaining varied degrees of popularity throughout various dependencies of the British Empire and in the United States. International competition between teams of Great Britain and the United States, Canada and the United States, and Great Britain and Australia are becoming more frequent and attract fair-sized crowds.

**CRILE, GEORGE WASHINGTON** (1864- ). An American surgeon (see VOL. VI). Dr. Crile was very active throughout the World War and, before the participation of the United States, was at the head of the Lakeside Hospital Unit attached to the British Expeditionary Force in France. After the entry of the United States, he was again in France in the capacity of senior consultant in surgical research and was made colonel of the Medical Officers' Reserve Corps. In 1924 Dr. Crile and others founded the Cleveland Clinic Hospital, an outgrowth of the Cleveland Clinic, founded in 1921 for clinical and research activities. There he evolved his bipolar theory of living processes—the theory that an electric force builds up and maintains the form and structure of all living cells—published in 1924. He also became known as a leader in the surgical treatment of goitre. In May, 1929, the clinic was destroyed by the explosion of X-ray films stored in the basement and by fire, which followed the explosion. More than 120 occupants of the building died from the effects of poisonous gas fumes released by the explosion. Plans for rebuilding the clinic were announced. His later works included *The Origin and Nature of the Emotions* (1915); *A Mechanistic View of War and Peace* (1915); *Man as an Adaptive Mechanism* (1916); *The Kinetic Drive* (1916); *A Physical Interpretation of Shock* (1921); *Surgical Shock and the Shockless Operation*, in collaboration with Lower (1920); *A Bipolar Theory of Living Processes* (1924); and *Problems of Surgery* (1928).

**CRIME AND CRIMINOLOGY.** See **PENALOGY.**

**CRISP, ARTHUR** (1881- ). An American painter. He was born at Hamilton, Ont., and studied with Bryson Burroughs and Frank Dumond at the Art Students' League, New York City. His art is essentially decorative and he

is best known as a mural painter. Among his most important murals are the decorations of the Belasco Theatre and the Playhouse, in New York City, and of the Houses of Parliament in Ottawa, Canada, besides many private residences in the United States. His best-known recent canvases are "British Recruiting on Boston Common," in the Commons' reading room of the House of Parliament, Ottawa, and "L'En-core," Canadian National Gallery. He was elected Associate of the National Academy of Design in 1911, won the first Hallgarten prize at the National Academy in 1916, and the gold medal at the New York Architectural League in 1923.

**CROATIA**, krô-â'shî-â, See JUGOSLAVIA.

**CROCE**, krô'châ, BENEDETTO (1866- ). An Italian philosopher (see VOL. VI). Although he accomplished his mature work between his 30th and 50th years, his reputation in Anglo-Saxon countries developed largely after the World War. The publication of a biographical volume in English by Piccoli (1923) corresponded to the growing interest in a philosopher who, like Bergson, was able to combine popular appeal and intellectual insight. At the close of the War, Signor Croce took an active part in Italian politics. He attacked the politics of President Wilson, which he regarded as short-sighted and dangerous to Italian interests, and in 1920 to 1921 served as minister of education in the cabinet of Giolitti. His later works include *La Letteratura della Nuova Italia*, essays (4 vols., 1914-15); *Teoria della storiografia* (1916); *Conversazioni critiche* (1918); *Goethe* (1919); *Pagine sparse* (3 vols., 1919-20); *La Poesia di Dante* (1920); *Ariosto, Shakespeare e Corneille* (1920); *New Essays on Aesthetics* (Eng. trans., 1921); *Storia della storiografia italiana nel secolo XIX* (1921); *Poesia e non poesia* (1923); *Storia del Regno di Napoli* (1924); *Uomini e cose della vecchia Italia* (1926); *Autobiographie* (Eng. trans., 1927), and *Storia d'Italia dal 1871 al 1915* (Eng. trans., 1928). See AESTHETICS and ITALIAN LITERATURE.

**CROCKER**, BOSWORTH (MRS. LUDWIG LEWISOHN). (?- ). A playwright born in London. She was brought to the United States as a child and educated in America. She is best known for her plays, *The Dog*, produced by the Bryden Road Players (1915); *The Last Straw* (1917); *Pawns of War* (1918); *The Baby Carriage* (1919); *Humble Folk*, a collection of one-act plays with a foreword by Ludwig Lewisohn (1923); *Heritage* (1925); *Cost of a Hat* (1925); *Reprisal* (1926); *Iseult of the White Hands* (1927); *Josephine* (1927). She also wrote a novel, *Don Juan's Wife* (1924) and contributed verse and critical articles on the drama to contemporary magazines.

**CROISSET**, krwâ'sâ' (JOSEPH MARIE) ALFRED (1845-1923). A French philologist (see VOL. VI) who was the author of *L'Effort de la France* (1916), *Les démocraties antiques* (1916); and *History of Latin and Greek and Democracy* (1919). He also edited *Otero José Pacifico: L'Argentine devant l'histoire* (1921), translated volumes 2 and 3 of the *Œuvres Complètes* of Plato, and, with his brother, Maurice, translated the tragedies of Euripides into Spanish.

**CROISSET**, MAURICE (1846- ). A French philologist (see VOL. VI). He was the author of *La civilisation hellénique* (2 vols., 1922) and translated into Spanish *Homer: la Odisea* (1921)

and collaborated with his brother on a Spanish translation of *Euripides Tragedies* (1921). He also edited and translated Volume I of the *Œuvres Complètes* of Plato, and the *Harangues* of Demosthenes (2 vols., 1924-25).

**CROISSET**, krwâ'sâ', FRANCIS DE (1877- ). The pseudonym of Franz von Wiener, a French-Belgian playwright who was born in Brussels, educated at the Athénée and the university there, and then lived in Paris. His plays, a few of which were in verse, were comedies, or else more serious studies in which the dialogue was clever and witty. His works include *Chérubin* (1901); *Le Paon* (1904); *Le Bonheur, mesdames* (1905); *Paris-New York* (1907); *Le Cœur dispose* (1912); *L'Épervier* (1914); *Pour la langue française* (1924), and *La féerie cinghalaise*, travel in Ceylon (20 ed., 1926). He wrote many plays in collaboration with others, the most notable of whom was Robert de Flers, with whom he wrote *Le retour* (1921); *Les Vignes du seigneur* (1923); *Les Nouveaux messieurs* (1926); and *Les Précieuses de Genève* (1928).

**CRO'KER**, BITHIA MARY (SHEPPARD) (?-1920). An English novelist (see VOL. VI). She died in London on Oct. 21, 1920. Her works written since 1914 include: *Lismoye* (1914); *Her Own People* (1914); *Babes in the Wood* (1915); *Given in Marriage* (1916); *Johanna* (1917); *Bridget* (1918); *The Chaperon* (1920).

**CRONAU**, krô'nô, RUDOLF GEORGE (1855- ). A German journalist and author born at Solingen. He has spent a great part of his time in New York. Among his works are *Geschichte der Sölinger Klingenindustrie* (1885); *Unter dem Sternenbanner* (1887); *Das Buch der Reklame* (1889); *Im wilden Westen* (1890); *Amerika, Geschichte seiner Entdeckung* (1890); *Our Wasteful Nation* (1908); *Drei Jahrhunderte deutschen Lebens in Amerika* (1909); *The British Black Book* (1915); *Our Hyphenated Citizens* (1915); *German Achievements in America* (1916); *Woman Triumphant, the Story of Her Struggles for Freedom* (1919); *The Discovery of America and the Landfall of Columbus* (1921); *The Army of the American Revolution and its Organizer* (1923); *Die Deutschen als Gründer von New Amsterdam-New York und als Urheber der amerikanischen Freiheitsbestrebungen* (1926), a work claiming for the Germans the credit of having founded New York and originated the American movement for freedom.

**CROOKS**, kruk's, WILLIAM (1852-1921). An English labor leader (see VOL. VI). In 1916 he was appointed Privy Councillor. He died soon after his retirement from Parliament in 1921.

**CROSLAND**, THOMAS W(ILLIAM) H(ODGSON) (1868-1924). A British editor and author (see VOL. VI). His later works include: *The Chant of Affection* (1915); *The Showmen* (1915); *The Soul of a Crown Prince* (1915); *The English Sonnet* (1916); *Pop Goes the Weasel* (1924), and *The Laureate's Job* (verse, 1924).

**CROSS**, (CHARLES) WHITMAN (1854- ). An American geologist (see VOL. VI). In 1918 he was president of the Geological Society of America, and a member of the National Research Council, 1918-22. He was also author of geological reports and maps published by the United States Geological Survey.

**CROSS**, WILBUR LUCIUS (1862- ). An American university dean (see VOL. VI). In

1916, he became dean of the Graduate School of Yale University, and in 1921, professor of English, resigning from a similar position in the Sheffield Scientific School. He was acting provost, 1922-23. He is the author of *A History of Henry Fielding* (1918); *An Outline of Biography* (1924); and editor of *Sterne's Political Romance* (1914); *Lounsbury's Life and Times of Tennyson* (1915); *Shakespeare's Love's Labor's Lost* (Yale Shakespeare, 1918); *Tristram Shandy* (1925); *Sentimental Journey* (1926), and *The Modern English Novel* (1928).

**CROTHERS, RACHEL** (1878- ). An American playwright born at Bloomington, Ill., who directs the production of her own plays. The quality of her work is good and her plays are exceptionally well known in the United States. They include: *The Three of Us*; *The Coming of Mrs. Patrick*; *Myself Bettina*; *A Man's World*; *Young Wisdom*; *Ourselves*; *The Heart of Paddy Whack*; *Old Lady 31*; *Once Upon a Time*; *Mother Carey's Chickens*; *A Little Journey*; *39 East*; *He and She*; *Nice People*; *Everyday*; *Expressing Willie*; *A Lady's Virtue*; *Venus*.

**CROWDER, ENOCH HERBERT** (1859- ). An American army officer. He was educated at the United States Military Academy and the University of Missouri Law School, and became major in the United States Judge Advocate's office in 1895. He was in the Philippines from 1898 to 1901, and with the Japanese Army in Manchuria in 1904-05. In 1899-1902 he was Judge Advocate General of the Army of Cuban Occupation; he drafted the legal code for the new republic and also helped to frame its constitution and to direct its financial policies and legislation. General Crowder is best known for his remarkable record as Provost Marshal General during the World War in administering the Selective Service Act which he himself had drafted. Under this law, about 24,000,000 men altogether had been registered and classified within 18 months after America had entered the War, two million of whom were in France, and almost as many more ready to go. He was awarded the D.S.M. for this service and received numerous foreign decorations. In 1919, upon invitation of the Cuban government, he initiated reforms in the Cuban electoral laws and in 1921 President Harding named him as his personal representative to the Cuban Government. In 1923 the rank of the United States' representative in Cuba was raised to that of ambassador, and General Crowder was the first to serve in that capacity. He was retired in 1927. See CUBA.

**CROWELL, BENEDICT** (1869- ). A mining engineer, born in Cleveland, Ohio, who entered war service in 1916 and was a member of the Kernan board of the War Department to report on munitions of war and arsenals. In 1917-20 he was Assistant Secretary of War and in 1918 was made director of munitions. Since 1920 he has been chairman of the board of the Crowell & Little Construction Co., Cleveland, Ohio. Among his recent books are *The Iron Ores of Lake Superior* and *How America Went to War*, in collaboration with Capt. Robert T. Wilson (1921).

**CROWTHER, SAMUEL** (1880- ). An American author, born at Philadelphia. He was educated at the University of Pennsylvania and subsequently engaged in newspaper work. He toured Europe in 1918-19 and collected his im-

pressions in several volumes. One of his most important works was *My Life and Work* (with Henry Ford, 1922), an excellent analysis of the mental processes of a large industrialist. He also wrote *The First Million the Hardest* (with A. B. Farquhar, 1922); *Life of John H. Patterson* (1923); *Today and Tomorrow* (with Henry Ford, 1926); *Men and Rubber* (with H. S. Firestone, 1926).

**CROZIER, WILLIAM** (1855- ). An American soldier (see VOL. VI). He was a major general and chief of ordnance from the beginning of the World War until December, 1917, a member of the War Council, and commander of the Northeastern Department until Dec. 31, 1918, when he was retired. For a time after his retirement, he lived in Peking. In 1928 the Polish Government conferred on him the decoration of Commander of the Order of Polonia Restituta. He wrote *Ordnance and the World War* (1920).

**CRUISER.** See VESSEL, NAVAL.

**CRUISER, ARMORED.** See VESSEL, NAVAL.

**CRUZ, OSWALDO GONSALVES** (1872-1917). A distinguished Brazilian sanitarian who studied medicine at Rio de Janeiro and Paris and bacteriology at the Pasteur Institute, Paris. Returning to Rio de Janeiro, he started an institute for bacteriology and serotherapy in 1900. He was made director of public health for the city with absolute powers to stamp out plague, yellow fever, small pox, malaria, and other pestilences. His methods embraced everything known in preventive medicine, including the condemning of much property, and within three years the city was comparatively healthy. The public reaction was so severe that at one time a revolution was threatened. Cruz by this time was practically director of public health for the whole of Brazil and as a result of his campaign his small private institute was raised to the status of a state institution, known as the Oswaldo Cruz Institute. Its annual reports illustrate its high character.

**CRYSTAL STRUCTURE.** See CHEMISTRY; PHYSICS.

**CRYSTALS.** See CHEMISTRY; PHYSICS.

**CUBA.** An island republic of the West Indies with an area of 44,164 square miles and a population according to the census of November, 1919, of 2,889,004. This was a gain of 840,024 over the last census year, 1907, or an annual average increase of 3.4 per cent. The white population increased, with a proportion to the total population in 1907 and 1919, respectively, of 69.7 and 74.3 per cent. Males continued in excess of females, the proportions for the two years were 52.5 and 53 per cent. The estimated population at the beginning of 1928 was 3,573,850. Immigration in 1911 amounted to 38,053; 1919, 80,485; 1920, 340,241; 1921-22, 128,177; 1927, 37,186. Immigration is of a transitory character, a large proportion of the immigrants returning to their native countries at the end of the sugar-crop season. Populations of the large towns in 1907 and 1927 were: Havana, the capital, 295,157 and 580,946; Cienfuegos, 30,100 and 39,020; Camaguey, 29,616 and 46,582; Santiago de Cuba, 45,470 and 63,216; Matanzas, 36,009 and 45,101. On June 30, 1927, there were 321,821 children enrolled in the 3702 elementary schools, which had 7110 teachers. There were also 467 private schools with 1545 teachers and 30,293 pupils. University in-

struction is provided by the University of Havana, which had 5473 students in 1926-27.

**Industry.** Sugar cultivation is the leading activity and the source of the country's well-being. The crop consistently increased after 1913. For that year, the crop was 2,443,986 long tons. The crop reached the very large total of 4,104,205 long tons in 1919 but dropped to 3,758,347 long tons in 1920; 1921 again showed an upward turn; 3,974,116 long tons were produced in that year. The 1922 crop reached almost 4,000,000 tons, while that of 1923, falling below previous estimates, showed a total production slightly in excess of 3,600,000 tons. In 1927 the crop was 4,508,000, while that of 1928 was limited to 4,000,000 tons. The purchase of sugar by the United States reflects the state of affairs. In 1913-14 the United States brought 4,926,606,000 pounds for \$98,894,782; in 1921, 5,180,145,000 pounds for \$194,156,615; in 1922, 9,054,289,838 pounds for \$227,257,590; in 1923, 6,852,685,625 pounds for \$331,925,712, and in 1927, 6,600,000,000 pounds for \$183,480,000. Tobacco is the crop of next greatest economic importance. In 1913 over 27,500,000 pounds (value \$16,164,795) were exported to the United States; in 1926, 24,113,000 pounds (value \$22,068,000). Other agricultural products are coffee, cacao, and tropical vegetables and fruits for the American winter markets, the economic value of these groups being slight. Cattle raising is receiving increasing attention with the result that herds increased from 2,829,553 heads in 1912 to 4,512,000 in 1925. Horses similarly increased in number. Mineral areas are considerable, but production is small. Iron, copper, chrome, manganese ores, and asphalt are regularly produced for export and there is a small output of coal and petroleum. Total exports of minerals in 1927 were valued at \$2,576,000, as compared with \$2,444,000 in 1926. Production of iron ore in 1913 was 1,608,000 metric tons; in 1926, 587,000 tons; copper in 1913, 3400 tons; in 1927, 14,096 tons.

**Commerce.** Imports in 1912 totaled \$120,229,317 and exports \$146,787,295; for 1918-19 they reached \$316,000,000 and \$477,000,000 and in 1919-20 the very high point of \$435,000,000 and \$862,000,000; for 1920-21 they dropped to \$356,435,000 and \$278,000,000 and for 1921-22 to \$180,259,000 and \$323,911,000. By 1923 imports once more ascended to \$226,118,000 for the fiscal year. In 1927 imports were valued at \$257,384,000 and exports, at \$322,705,000. The United States is the most important factor in Cuba's foreign trade, the proportions for exports and imports ranging between 70 and 80 per cent of the whole. In 1913-14 the American imports from Cuba totaled \$132,303,795; for 1920, \$721,693,880; for 1922, \$267,840,867; for 1923, \$376,442,581; and for 1927, \$245,195,052. American exports to Cuba amounted to \$68,884,428 in 1913-14; for 1920, \$515,208,731; for 1922, \$127,873,202; for 1923, \$192,437,893; and for 1927, \$159,681,523. The importance of this trade may be gauged by the fact that in 1920, American imports and exports from and to Cuba almost equaled the whole United States trade with South America. For 1922-23 the American trade with Cuba was equal to 75 per cent of the whole South American trade. Other countries participating in Cuban trade are Great Britain, Spain, and France. Imports, in the order of importance, are foodstuffs, textiles, metals and metal goods, machinery, drugs, and wood.

**Finance.** For 1912-13 estimated revenues were \$37,940,000 and expenditures, \$33,974,147; for 1922-23, \$55,638,800 and \$54,852,302; for 1928-29, \$84,400,000 and \$84,387,000. The national debt in 1911 was \$62,083,100, with the debt service, in 1911, \$2,464,585. In July, 1922, the public debt was \$91,542,400 and in February, 1928, \$93,443,500, funded and floating. By the law of November, 1914, a Cuban coinage was established, with a gold peso equal to the American dollar. American coinage remains legal tender. Cuban currency in circulation in June, 1927, was \$23,786,750 gold, \$8,413,140 silver, \$1,449,560 nickel, and \$228,572,002 in American bank notes. In an effort to hasten the stabilization of financial conditions, the United States Federal Reserve Board granted the applications of the Boston and Atlanta Federal Reserve Banks to establish agencies in Cuba in June, 1923. At the same time, as a result of the recommendations of the former governor of the Federal Reserve Board, W. P. G. Harding, who had served as financial adviser to Cuba in 1922, a Cuban national commission reported in favor of the creation of a Cuban Reserve Bank with powers to accept deposits, rediscount commercial paper, and issue paper currency.

**Communications and Shipping.** In 1928 there were 3027 miles of railway, as compared with 1949 in 1913. 7408 vessels of 24,421,972 tons net entered and 7244 vessels 23,893,754 tons net cleared the ports of the Republic.

**History.** Large sugar crops and good prices brought the country increasing prosperity. Following the closely contested election of 1916, a revolt broke out, Feb. 9, 1917, led by ex-President Gomez, but the Government, aided by the presence of American forces in the province of Oriente and by American moral support, soon had the situation in hand. In May, 1917, the Cuban Congress announced the reelection of President Menocal over his Liberal opponent, Alfredo Zayas. On April 7, 1917, both houses of Congress unanimously passed a measure declaring war on Germany. A war loan of \$13,000,000 was raised, new taxes laid, a draft act passed (1918), and the office of alien property custodian created. In 1919, as the result of the aid of General Enoch H. Crowder, U. S. A., invited by the Cuban government to advise on electoral reforms, a new electoral code was adopted designed to secure fair elections for the country in the future and providing, among other things, for obligatory voting and the public counting of ballots. In the election of 1920, political excitement ran high. Dr. Zayas, running on a Conservative-Liberal coalition ticket against General Gomez, was declared elected. The threatened crisis that followed, together with the declaration of a moratorium, led President Wilson to send General Crowder once more to Cuba. New provincial elections confirmed Zayas's victory and he was inaugurated on May 20.

In 1920-21 Cuba suffered a severe financial depression which was felt the more severely because of its contrast with the abnormal prosperity of 1919. In January, 1922, American marines were removed from the island, but General Crowder remained until October, 1922. His influence brought a number of administrative reforms, including a new civil service law, improvement of the accounts system, and means for facilitating the removal of judges. He also helped in the construction of a \$50,000,000 loan,

approved by the United States in accordance with the Platt Amendment and floated in January, 1923. With the reform measures mentioned, this loan helped to dissipate the 1920-21 depression and restore prosperity. General Crowder was named as the first American Ambassador to Cuba on Feb. 9, 1923, and on Sept. 1, 1923, Dr. Cosme de la Torriente was named Cuban Ambassador to the United States. Two days later Dr. de la Torriente was elected president of the League of Nations assembly at Geneva. In July, 1923, the feeling against continued participation of the United States in Cuban affairs found expression in a joint resolution in Congress stating that "outside interference with their civil affairs" might prejudice Cuba against the United States.

In domestic affairs, a new force emerged in August, 1923, with the formation of the Veterans' and Patriots' Association. It immediately began to conduct a campaign against public graft, the national lottery, the disabilities of women, and for the paying of soldiers' back pensions. It was so powerful that its programme was at once adopted by one of the candidates for presidential honors. In 1924 this propaganda almost succeeded in precipitating a national crisis. President Zayas moved against the Association with alacrity; its leader, General García-Vélez, was dismissed from the diplomatic service and compelled to quit the country; *El Sol*, the Association's organ, was suppressed on March 25. García-Vélez took refuge in New York and continued to direct activities, and sentiment in Cuba became feverish. An armed revolt broke out on April 29, in Central Cuba; to this the Government replied by seizing the leaders of the Veterans' and Patriots' Association. Fighting went on for two weeks, principally in the provinces of Santa Clara and Oriente, but the back of the rebellion was broken when President Zayas succeeded in inducing the United States War Department to sell the Cuban government large stores of arms and ammunition. Materials to the value of \$208,000 were purchased in this way by May 10. A general amnesty was granted May 17. Hostile elements insisted that the incident had been enormously magnified, for the most part by Zayas himself who sought to strengthen his popularity in Cuba, and that the Veterans' and Patriots' Association, instead of being discredited, remained a great force in internal affairs. Its influence, at any rate, was a large factor in eliminating President Zayas from the presidential race in 1924, from which he withdrew because of lack of popular support. He threw his strength to General Gerardo Machado, the Liberal candidate. The other candidate was General Mario Menocal, former President, who was supported by the Veterans' and Patriots' Association and other reform advocates.

In the November elections, General Machado was chosen by a large plurality. In the spring of 1925, he visited the United States. He was inaugurated on May 20, his inaugural address promising to maintain cordial relations with the United States and to promote internal improvements. In March, 1925, the United States Senate ratified a treaty with Cuba which had been before it for 20 years, by which the United States relinquished all claims to the Isle of Pines. In other respects, foreign relations, for the most part, were also satisfactory, although there was evidence of chafing among Cuban na-

tionals under the restrictions of the Platt Amendment giving the United States certain rights of supervision over Cuba's internal affairs. In November, 1926, a flurry was caused by a statement made by a Uruguayan delegate to the League of Nations to the effect that Cuban sovereignty was restricted by the terms of her relations with the United States. A rupture in diplomatic relations was averted only by an official apology by Uruguay.

In April and May, 1927, President Machado made an extended trip in the United States, in the course of which he expressed the desire for a modification of the Platt Amendment and later he advocated its complete repeal. In September, 1927, Cuba was elected to a non-permanent seat on the League of Nations Council. The outstanding international event of President Machado's first administration was the holding of the Sixth Pan-American Conference at Havana in January and February, 1928, and the attending visit of President Coolidge to the island. Cuban economics was marked by an attempt in 1927 and 1928 to keep the price of sugar stabilized by restricting the output, and in 1928 by officially regulating exports. Although the scheme was credited with having some effect on prices, the lack of a monopoly of world production by Cuba prevented it from achieving its full objective and at the close of 1928 all restriction was abolished.

Politically, the course of events under President Machado paralleled that in many other countries during this period in tending toward a centralized control which, it was charged by the opposition, approached, if it did not actually constitute, a dictatorship. Political opposition was strongly discountenanced, and on occasion sternly suppressed. On April 18, 1928, Senator Shipstead introduced into the United States Senate a resolution calling for an investigation under the Platt Amendment of charges of suppression of freedom of speech, political deportations, closing of the national university, manipulation of courts, etc. The resolution aroused a storm of protest in the Cuban press, but the Government took no official notice of it.

In June, 1927, President Machado approved a bill providing for certain constitutional amendments. In accordance with Cuban law, these amendments, after being passed by the Cuban Congress, must be passed upon by a constitutional convention elected for that purpose. The convention met the following year. As one result of its deliberations the term of the president was set at six years instead of four. He was restricted to a single term, but this limitation did not apply to President Machado. A coalition of three political parties nominated him for another term and in the elections in November he was chosen without opposition for a term ending in 1935. He was inaugurated in the new capitol at Havana.

**CUBISM.** See PAINTING.

**CULBERTSON, WILLIAM SMITH** (1884- ). An American lawyer, tariff expert, and diplomat, born at Greensburg, Pa. He graduated from the College of Emporia, Kan., in 1907, and from Yale University in 1908. After taking special courses in German universities, he became examiner of the United States Tariff Board in 1910, serving until 1912. From 1917 to 1925, he was a member of the United States Tariff Commission, serving as vice chairman after 1922. He resigned in 1925 to accept appointment

as Minister to Rumania. During the World War, he was engaged in Y. M. C. A. service in France, and in services for the Government at the Peace Conference in Paris. He is the author of *Alexander Hamilton, an Essay* (1911); *Commercial Policy in War Time and After* (1919); *Raw Materials and Foodstuffs in the Commercial Policies of Nations* (1924); *A Survey of the Economics of Diplomacy* (1925).

**CULLEN, THOMAS STEPHEN** (1868- ). An American gynecologist, born at Bridgewater, Ont. He was educated at the Toronto Collegiate Institute and the University of Toronto, became associated with the Johns Hopkins Hospital College and was made a professor of clinical gynecology at the latter and visiting gynecologist to the hospital. He has written, alone and in collaboration four important monographs: *Cancer of the Uterus* (1900); *Adenomyoma of the Uterus* (1908); *Myomata of the Uterus* (1909); *Disease of the Umbilicus* (1916); and also *Henry Mills Hurd* (1920); and *Early Medicine in Maryland* (1927).

**CULTURE.** HISTORY OF. See ETHNOLOGY.

**CUMBERLAND, WILLIAM WILSON** (1890- ). An American economist, born at La Verne, Calif., and educated at Occidental College, Los Angeles, and at Columbia and Princeton universities. In 1916 he became a member of the faculty of the University of Minnesota. In 1918-20 he was economic or financial expert on United States Government boards and commissions to the Paris Peace Conference, to Turkey, and Armenia and in 1921 was attached to the Department of State as expert on foreign trade. In 1921-23 he was Administrator of Customs of the Republic of Peru and governor of the Reserve Bank of Peru, 1923-24. Since 1924 he has acted as financial adviser and general receiver of the Republic of Haiti. He published *Coöperative Marketing* (1918).

**CUMBERLAND PRESBYTERIAN CHURCH.** This denomination originated in Tennessee in 1810 as an outgrowth of the revival of 1800 in Kentucky and Tennessee and in protest against some of the doctrines taught by Calvinists of that day. The membership in 1929 was 64,031, as compared with a membership of 72,052 in 1916, and the number of ministers in the latter year was 735, as compared with 728 in 1916. In 1929 there were reported 10 synods and 62 presbyteries. As a result of the merger movement of 1906, when about half the denomination joined with the Presbyterian Church in the United States of America, the Cumberland branch in 1914 was practically without property and without any educational endowment; in 1929 the church property was valued at \$3,968,868; there was an endowment of \$500,000 for education; and under the direction of the Board of Education, Bethel College and the Cumberland Presbyterian Theological Seminary, were maintained at McKenzie, Tenn. *The Cumberland Presbyterian* was published at Nashville. The 1928 National Meeting was held at Jackson, Tenn., and the 1929 meeting at Princeton, Ky.

**CUMMING, HUGH S.** (1869- ). An American Surgeon General of the Bureau of Public Health Service. He was born in Virginia and received the degree of M.D. at the University of that State (1893). Appointed an assistant surgeon in the U. S. Public Health Service in 1894, he was advanced to the rank of surgeon in 1911. During the World War he served as a Public

Health Service expert with the Navy. He became Surgeon General of the U. S. Public Service in 1920. He was president of the Allied Medical Mission to Poland and represented the United States on other international conferences. He is the author of professional papers and pamphlets.

**CUMMINS, ALBERT BAIRD** (1850-1926). An American Senator (see VOL. VI). He was re-elected United States Senator for the terms 1915-21 and 1921-27. He was joint author with Representative Esch of the act which returned the railroads to private ownership after the World War. He succeeded Calvin Coolidge as president of the Senate in August, 1923.

**CUMONT, KU'MON', FRANZ VALÉRY MARIE** (1868- ). A Belgian writer on Oriental religions (see VOL. VI), who, in 1928, added an honorary D.Litt. from Cambridge, England, to his long list of distinctions. His later works include *Comment la Belgique fut romanisée* (1914); *Études syriennes* (1918); *After-life in Roman Paganism* (1922); *Juliani imp. epistulae et fragmenta*, with Bidez (1922); and *Fouilles de Douro-Europos* (1926).

**CUNLIFFE-LISTER, KÜN-LIF-LISTER, THE RT. HON. SIR PHILIP** (1884- ). A British government official who assumed his present name in 1924. He was educated at Winchester and University College, Oxford, was called to the bar in 1908, and served in the army from 1914 to 1917, receiving the Military Cross. In the latter year, he became joint secretary of the Ministry of National Service, and in 1918 he entered Parliament as a Unionist. After serving on several committees, he was Parliamentary Secretary to the Board of Trade (1920-21), secretary to the Overseas Trade Department (1921-22), and president of the Board of Trade (1922-23, and 24- ). He was knighted in 1920 and became a privy counselor in 1922.

**CUNO, KÜ-NÖ (CARL JOSEPH) WILHELM** (1876- ). A German chancellor and director-general of the Hamburg-American Steamship Line. He was born at Suhl, Thuringia, Germany, and educated at Berlin, Heidelberg, and Breslau. He became connected with the Department of the Treasury in 1906, and in 1912 was made privy counselor. During the World War, he was director of the grain and food organization, and upon the death of Albert Ballin became the head of the Hamburg-American Steamship Line. He represented Germany at the Paris Peace Conference, and became chancellor in November, 1922. He was much criticized because of his policy of passive resistance to the French occupation of the Ruhr, and also for the fall of the mark. He resigned on Aug. 12, 1923, the immediate cause being the loss of Socialistic backing in the Reichstag.

**CUREL, KU'REL', FRANÇOIS, VICOMTE DE** (1854-1928). A French dramatist (see VOL. VI), who was elected to the French Academy in 1918. His later works were *La Danse devant le miroir* (1914); *L'Âme en folie* (1920); *La Comédie du Génie* (1920); *L'Iressse du Sage* (1922); *Terre inhumaine* (1922); *La Viveuse et le moribond* (1928); and *Orage mystique* (1927). Consult *Idées et portraits*; by Louis Bertrand (1927).

**CURLLEY, MICHAEL JOSEPH** (1879- ). An American Roman Catholic archbishop, born at Golden Island, Athlone, Ireland, and educated in the Royal University of Ireland and at the College of the Propaganda Fide in Rome. He

was ordained to the Roman Catholic priesthood in 1904, and for the 10 ensuing years was a missionary in Florida. In 1914 he was made Bishop of Saint Augustine and in 1921 Archbishop of Baltimore to succeed Cardinal Gibbons.

**CURRAN, CHARLES COURTNEY** (1861- ). An American artist (see VOL. VI). He was awarded the first Altman Prize by the National Academy of Design in 1920.

**CURRELLEY, CHARLES TRICK** (1876- ). A Canadian clergyman, director of the Royal Ontario Museum of Archaeology (see VOL. VI). In 1919 he returned from his eight-year collecting trip to Egypt and Europe. Later, he was appointed professor of the history of industrial art in the University of Toronto.

**CURRICULUM REVISION.** See EDUCATION IN THE UNITED STATES.

**CURTIS, CHARLES** (1860- ). An American Senator and Vice President (see VOL. VI). He was reelected to the United States Senate for the terms 1915-21, 1921-27, and 1927-33. In June, 1928, he was nominated for vice president by the National Republican Convention at Kansas City and elected on Nov. 6 for the term beginning on Mar. 4, 1929.

**CURTIS, CYRUS HERMANN KOTZSCHMAR** (1850- ). An American publisher (see VOL. VI). He purchased the New York *Evening Post* in 1923, retaining his ownership of the Philadelphia *Public Ledger*, the *Saturday Evening Post* (Philadelphia), the *Ladies' Home Journal*, and the *Country Gentleman*, and expanding the circulation and influence of all these publications. In 1924 he founded the Curtis Institute of Music, Philadelphia, of which Josef Hofmann became director in 1927.

**CURTISS, GLENN HAMMOND** (1878- ). An American aviator (see VOL. VI). In 1914, he designed and constructed for Rodman Wanamaker the *America*, which was the first heavier-than-air flying boat made for transatlantic passage. In 1917, in conjunction with J. N. Willys, he increased the output of his factories to meet the war demands of England, Russia, and the United States. He developed various types of aircraft, especially the *Wasp*, the holder of world records for speed and altitude, and, with the United States Navy, the Navy-Curtiss flying boats 1, 2, 3, and 4. He also built several types of aeronautical motors and designed and made machines of distinctive plan.

**CURTISS, RALPH HAMILTON** (1880- ). An American astronomer, born at Derby, Conn. He was graduated in 1901 at the University of California, where in 1904 he received his Ph.D. After serving as an assistant in astronomy at California during 1900-01, he was a fellow during 1901-05 at the Lick Observatory, and was a member of the Lick Eclipse Expedition (1901) to Sumatra. In 1905 he became assistant astronomer at Allegheny Observatory and two years later, assistant professor of astrophysics at Michigan, where in 1918 he became full professor, also serving as assistant director and after 1927, director, of the Detroit Observatory. His researches have had to do chiefly with the spectroscopy of the heavenly bodies, photography of comet forms, spectrography of variable stars, and of stars with peculiar spectra in Class B, on all of which he has published papers.

**CURWOOD, JAMES OLIVER** (1878-1927). An American author; born at Owosso, Mich. From 1900 to 1907, he was engaged in newspaper

work, but in the latter year resigned from these activities to devote himself exclusively to novel-writing. His romances enjoyed a wide popularity and sold by the hundreds of thousands annually. They were usually vivid tales of the Canadian Northlands, depicting conventional emotions and conflicts, but written with an earnestness that often gave them the aspect of reality. The better known included: *Flower of the North* (1912); *God's Country and the Woman* (1915); *Nomads of the North* (1919); *The Valley of Silent Men* (1920); *The Country Beyond* (1922); *The Alaskan* (1923); *A Gentleman of Courage* (1924); *The Ancient Highway* (1925); *The Black Hunter* (1926).

**CURZON LINE.** See VILNA DISTRICT.

**CURZON OF KEDLESTON, GEORGE NATHANIEL CURZON, FIRST MARQUIS OF** (1859-1925). An English statesman (see VOL. VI). In the Asquith coalition cabinet, he was Lord Privy Seal (1915-16) and President of the Air Board (1916). In December, 1916, in Lloyd George's government, he was one of the four members of the War Cabinet in whose charge rested the details of all military and civilian operations, leader of the House of Lords, and lord president of the Council. In 1919 he resigned the latter office and became Secretary of State for Foreign Affairs, a portfolio he held until his retirement on the resignation of the first Baldwin government in 1924. While Lloyd George was Prime Minister, Curzon was not the chief in his own department, but when Bonar Law became Premier, he was given a free hand. In the West, he had continual differences with France, first over the reparations question, and then in actively opposing the French occupation of the Ruhr. But in the East, his leadership had its real successes. In April, 1923, he presided over the Lausanne Conference to conclude a peace with Turkey. The task was a difficult and complicated one and the terms that Curzon got were considered the best obtainable.

He was an expert analyst of a situation, but was not regarded as an equally able executive. He was apt to push a plan and then retreat from it. Although considering the bill for the enfranchisement of women very undesirable, he did not vote against it. He attained all the grades of the peerage except that of Duke. In 1916 he received the Garter. He wrote *Modern Parliamentary Eloquence* (1913); *War Poems and Other Translations* (1915); *Subjects of the Day* (1915); *Tales of Travel* (1923); *British Government in India* (1925); and *Leaves from a Viceroy's Note-Book and Other Papers* (edited by F. W. Pember and I. Malcolm, 1926). The Earl of Ronaldshay wrote *The Life of Lord Curzon* (3 vols, 1927-28).

**CUSHENDUN, KÓOSH'ÊN-DÍN, THE RT. HON. RONALD JOHN MCNEILL, FIRST BARON** (1861- ). A British public official who was born in Ireland and educated at Harrow and Christ Church, Oxford. In 1887 he was admitted to the bar. Twelve years later he became assistant editor of *St. James's Gazette*, of which he was editor from 1900 to 1904. A Unionist in politics, he stood four times for Parliament from 1906 to 1910 and in 1911 was elected, retaining his seat until he was raised to the peerage in 1927. He was parliamentary Under-Secretary of State for Foreign Affairs from 1922 to 1925, with the exception of the period in 1924 when Labor was in control of the Government. Financial Secretary of the Treasury (1925-27), and, after the resig-

nation of Lord Robert Cecil in August, 1927, took his place in the cabinet as Chancellor of the Duchy of Lancaster and British representative at the League of Nations. At the same time, he became a peer as Lord Cushendun. He had been made member of the Privy Council in 1924. In August, 1928, the poor health of Sir Austin Chamberlain forced him to take a long vacation, and Lord Cushendun was appointed acting Foreign Secretary in his absence. In this capacity, he signed the Paris Peace Pact, and had the difficult task of allaying the suspicions of the other nations on their discovery of the Anglo-French naval accord. He wrote *Home Rule: Its History and Danger* (1907); *Socialism* (1908); "History of Australia and New Zealand" in *Historian's History of the World* (1908), and *Ulster's Stand for Union* (1925).

**CUSHING, HARVEY (WILLIAMS)** (1869- ). An American surgeon (see Vol. VI). During the World War, Dr. Cushing was director of United States Base Hospital No. 5. His monograph, *Tumors of the Nervous Acusticus*, was published in 1917. Recently, Dr. Cushing has lectured in Great Britain on his special subject of tumors of the brain and the number of patients whom he has operated on for this condition is now reckoned in the thousands. In the field of literature, Dr. Cushing produced a biography of Sir William Osler in two volumes (1924) which won the Pulitzer award of \$1000 for the year's best biographical work. Later works are *Studies in Intracranial Physiology and Surgery* (1926) and *Consecration Medici and Other Papers* (1929).

**CUSHNY, ARTHUR ROBERTSON** (1866-1926). A British pharmacologist, who was born in Speymouth, Morayshire, Scotland. He was graduated in arts and medicine from the University of Aberdeen in 1889, took post-graduate courses on the Continent, and during 1892-93 was assistant to the professor of pharmacy at the University of Strassburg. In 1893 he came to the United States as professor of pharmacology at the University of Michigan, remaining until 1905, when he was called to the chair of pharmacology and materia medica at the University of London. In 1918 he was called to the same department of the University of Edinburgh. His chief writings are his *Textbook of Pharmacology and Therapeutics*, (1916, 8th ed., 1924) and monographs, *Secretion of Urine* (1917) and *Use in Medicine of Digitalis and its Allies* (1924).

**CUTHELL, CHESTER WEDE** (1884- ). An American lawyer, born in New York City. After graduating from Columbia University Law School, he began the practice of law in New York City, and also in Washington. In 1918-19 he acted as general counsel of the United States Shipping Board Emergency Fleet Corporation, and effected collections of claims of the War Department against England, France, and Italy. He was awarded the Distinguished Service Medal of the United States and decorations by the governments of France and Italy.

**CYCLING.** Professional cycling now ranks as one of the most profitable sports in the United States, where large velodromes have been constructed to accommodate the large crowds attracted by the professional racing events. Cycling as a recreation also has its devotees, particularly among the children.

**CYCLONES.** See METEOROLOGY.

**CYPRUS.** An island of the Mediterranean and a British Crown colony; area, 3584 square

miles; population in 1911, 274,108; in 1926, 310,709. The population was 80 per cent Greek and almost 20 per cent Turkish. The leading activity is agriculture. Chief exports in 1926 (1911 figure in parentheses) were animals, £71,166 (£94,932); carobs, £153,905 (£182,833); wine, £39,178 (£53,685); raisins, £58,198 (£29,636); fruits, £40,905 (£21,585); silk cocoons, £6204 (£27,587). Imports are foodstuffs, coal, petroleum, cotton piece goods, manufactured articles, and machinery. The trade record shows that the imports for 1913, 1920, and 1927, exclusive of bullion, were £619,337, £2,068,759, and £1,585,639; exports for the same years, £620,591, £1,200,449, and £1,542,870. Revenues for 1913-14 were £341,816; for 1926, £629,266. Expenditures for 1913-14 were £296,165; for 1926, £655,227. The imperial annual grant is £50,000; the public debt, 1926, £186,732. British occupation of Cyprus, since 1878, became outright possession when the British Government declared the island formally annexed on Nov. 5, 1914. The Treaty of Lausanne in 1923 recognized Great Britain's right in Cyprus.

**CYRENAICA.** See LBYA.

**CYTOLOGY.** See ZOÖLOGY.

**CZECHOSLOVAKIA**, *chěko-slovák'ia*. One of the newly created states of Europe, formed out of all or parts of the old Austro-Hungarian government of Bohemia, Moravia, Silesia, Slovakia, and Ruthenia, on Oct. 28, 1918. The frontiers, delimited by the Treaties of Versailles, St. Germain, and the Trianon, and the Ambassadors' Conference of July 28, 1920, affecting the Teschen district, had an area of 54,207 square miles and a population, by the census of Feb. 15, 1921, of 13,613,172. The provinces, with their areas and populations, are Bohemia, 20,102 square miles, population, 6,670,582; Moravia, 8616 square miles, population, 2,662,884; Silesia, 1708 square miles, population, 672,268; Slovakia, 18,895 square miles, population, 3,000,870; Ruthenia, 4886 square miles, population, 606,568. The principal towns, with their populations in 1921, are Prague, 676,657; Brunn, 221,758; Pilsen, 88,416; Pressburg, 93,189; Kosice, 52,898. Ethnologically, the great majority of the people are Czechoslovaks (8,760,937); the ratio between Czechs and Slovaks is about three to one. Of the other races, the Germans include 3,123,568, the Magyars, 745,431; the Ruthenians, 461,849; the Jews 180,855; the Poles, 75,853. From 1910 to 1921, the Czechoslovaks increased 9 per cent and the Ruthenians 6, while the Germans declined 17 per cent and the Magyars 30. By religions, the population was divided into Roman Catholics, 10,384,833; Protestants, 990,319; Greek Catholics, 535,543; and Jews, 354,342. Compulsory education is provided for with particular care in Slovakia and Ruthenia, where the stern policy of Magyarization systematically carried out by the Hungarian government had kept the mass of the population ignorant of their native tongue. In 1926 there were 14,158 public and private elementary schools, with 694,282 boys and 709,541 girls; and 1736 public and private higher grade schools with 165,601 boys and 144,409 girls. There were also 354 secondary Latin and technical schools with 108,760 pupils. There are four universities as follows: Prague (Czech) with 8176 students; Prague (German), 3447; Brunn (Czech), 1878; and Bratislava (Slovak), 1309. By the treaties, racial minorities are guaranteed protection in

their racial and religious rights. In districts where a minority constituted 20 per cent of the population, full rights were accorded for the use of the native tongue in schools and before judicial and administrative bodies. See SLAVONIC LITERATURE.

**Agriculture.** Because industry in the East was primarily agricultural, the largest single group of workers is busied on the land; this is about 40 per cent of the total population. Methods of production are intensive; aided by a strong government interest, they yield good profit. In 1926 there were 14,609 acres of arable land, or about 42 per cent of the total area; 6,374,000 acres of permanent meadow and pasture; 406,000 acres of trees, shrubs, and bushes and 11,495,000 acres of woods and forests. The following table compares acreage and production in 1919 and 1927:

Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1919	1927	1919	1927
Wheat	883	1,579	15,369	40,384
Rye	1,811	2,012	82,734	49,297
Barley	891	1,755	21,569	59,014
Oats	1,368	2,108	46,099	100,423
Corn	82	391	443	11,755
Potatoes	885	1,607	84,091	334,703
Sugar beets	433	727	3,636 *	8,124 *
Hops	21	31	5,894 *	21,609 *
Grapesvines	46 *	42	8,807 *	16,715 *
Hemp	1	28	720 *	16,715 *
Flax	85	54	16,881 *	25,386 *
Tobacco	8 *	13	3,893 *	15,653 *

\* unit, metric ton    \* unit, pound    \* 1920

\* unit, gallon of wine

Live stock (1927) included cattle, 4,691,320; horses, 740,202; pigs, 2,539,201; sheep, 861,128; goats, 1,241,701. These numbers were considerably less than those antedating the World War. The sugar-beet industry, which ranked second in the world, engaged 166 factories and refineries in 1926, and these produced 722,955 metric tons of sugar; production in 1927-28 was 1,241,000 tons. Similarly, the hop industry supported 525 breweries which produced 264,749,000 gallons of beer in 1927. The centre of hop culture is in the Saaz, the breweries in Pilsen. Land reform, always a crying need in the provinces, because of the preponderance of great entailed estates usually owned by foreign families or by German or Magyar overlords, became at once the concern of the new Government. By an act of 1919, the National Assembly ordered the expropriation of all estates of more than 475 acres if cultivated and of 350 acres if uncultivated. By January, 1922, 9,746,076 acres had been seized. In Bohemia, farms of  $7\frac{1}{2}$  acres or less totaled only 23.5 per cent of the whole area; all the rest consisted of large estates. In Moravia, small farms had totaled 29.6 per cent, and in Silesia, 25.2 per cent. The progressive character of the agricultural class was indicated by the presence of some 10,000 agricultural coöperatives with a membership of 1,000,000.

**Minerals and Industries.** Coal and iron are the principal minerals. Coal production, including lignite, in 1921 totaled 32,699,112 metric tons; in 1928, 35,880,861 tons. While coal does not suffice for native wants, the yield of lignite is more than sufficient. In the Ostrava-Karvin Basin, 70 per cent of the total coal production was mined; in the Most-Teplice Basin, 77 per cent of the total lignite was extracted. Other mines yield gold, lead, copper, rock-salt, and graphite. The total number of

workers in coal mining in 1928 reached 94,420. The petroleum region, extending along the Carpathians and marking the continuation of the Galician fields, produces about 7000 tons annually. With these resources, the metallurgical industry is able to support 27 furnaces, 10 of them in Bohemia, the most important at Witkowitz and Kladno, with an annual capacity of 1,500,000 tons. In 1927, 1,300,000 tons of pig iron were turned out; in 1921, 543,100 tons. Steel production reached 1,700,000 tons in 1927. There are well-known mineral springs at Karlsbad, Marienbad, Franzensbad, Teplitz, and the chalybeate springs of Giesshübel and Bilin. Other plants, numbering some 11,619 in 1925 concern themselves with the manufacture of textiles, glass and precious stones, food articles, furniture, machines, metals, paper, and chemicals. The important centres for textiles are Reichenberg, Trautenau, and Brünn; for china, Karlsbad; for glass, Gablonz and Haida; for chemicals, Aussig.

**Commerce.** Imports in 1921 reached a value of 22,435,000,000 crowns; in 1922, 12,695,000,000 crowns; and in 1927 they were 17,937,095,000 crowns. Exports for 1921 and 1922 were 27,312,000,000 and 18,086,000,000 crowns, and 20,125,773,000 crowns in 1927. The principal exports are glass, finished textiles, fuel, and sugar; the imports are raw textiles, foodstuffs, and iron. The greatest volume of imports come from Germany, which, in 1927, sent 35.2 per cent of the total. Others participating were the United States, 5.6 per cent; and Austria, 7.8 per cent. Proportions of exports, by value, in 1927 were: Germany, 24.1 per cent; Austria, 15.2 per cent; United Kingdom, 7.6 per cent. Imports from the United States for 1927 were valued at \$36,343,000, and exports at \$29,958,000.

**Communications.** On Jan. 1, 1928, there were 8522 miles of railway in the state, of which 6849 miles were government owned. In July, 1923, the Government acquired the Bustchrad Railway, the last privately owned line of importance. From 1920 on, the Government applied itself to the projection of a system of lines connecting east and west. The programme called for the construction of 15 new lines, 558 kilometers in length, of which 389 kilometers were to be in Slovakia, and the rest, of lines connecting Slovakia with the West. The plan included the building of a railway through the centre of Slovakia, leading from Veseli on the Moravia River to Marmaroska Sihot. There are 265 miles of navigable waterways on the Elbe and Danube rivers. The former connects the country with Hamburg and the North Sea and the latter with the Balkans. Pressburg is the chief port on the Danube and its terminal developments are being rapidly pushed. By the Treaties, Czechoslovakia was given the right to use certain wharfs in the ports of Hamburg and Stettin. The country had 44,231 miles of telegraph line and 249,194 of telephone line in 1926.

**Finance.** In 1927 the total debt amounted to 34,385,000,000 crowns, of which 23,592,000,000 were internal debt; 6,393,000,000; external debt; and 4,400,000,000, debt imposed under the terms of the peace treaty. In the budget for 1928, receipts were estimated at 9,562,270,000 crowns (\$283,043,000, at \$.0296) and expenditures, at 9,536,074,000 crowns (\$282,268,000). Revenues came from direct taxation, indirect taxation, government monopolies, and state enterprises.

On the service of the debt, the 1928 budget carried 2,774,369,000 crowns. In December, 1927, 8,417,000,000 crowns were in circulation, against a metallic reserve of 1,007,000,000 crowns.

**History.** That Czechs, whose dreams of national independence had been kept alive since their defeat at the Battle of the White Mountain in 1620, should look on the outbreak of the War with misgivings and should render its prosecution only a lukewarm support was to be expected. Their leaders had openly identified themselves with Pan-Slavism; victory for the Central Powers would mean submergence of their racial aspirations. But that resentment should be so violent as to take the form of wholesale desertions had presumably never occurred to the Austrian bureaucracy. It is estimated that voluntary surrenders of Czechs to Serbs numbered 35,000 in 1914 alone; 300,000 surrendered to Russians and 30,000 to Italians during the war period. Retaliatory measures were therefore extreme. Czech civilians interned numbered 25,000; 5000 were sentenced to death by courts martial; attempts were made to force submission by the imprisonment of the womenfolk of absent Czech patriots; papers were suppressed, the Slav societies dissolved, and German installed as the official language in Bohemia. Magyar activities in Slovakia were even harsher. Driven underground, Slovak resistance took the form of a secret society, a sort of Mafia, which kept up a steady stream of communications with leaders abroad, maintained a secret intelligence, and practiced successfully an economic and military sabotage.

The outside world was apprised of the struggles of the people for independence by the Czechoslovak National Committee at Paris, and the work of the outstanding national leaders, the Czechs Masaryk and Beneš, and the Slovak Stefanik. First fruits of their labors appeared when the liberation of the Czechoslovaks was included in the statement of the Allies' war-aims on Jan. 10, 1917; the next development was Czech spokesmen's audacious championing of their causes of historic rights and national self-determination in the first Austrian Parliament called since 1914, on May 30, 1917. On Jan. 6, 1918, at Prague, a convention of all the leaders of the Czechoslovak world met and openly made demands for a sovereign state and the liberation of Slovaks from Magyar exploitation. Other such congresses, at Prague, April 13; at Rome, April 8-10, and again at Prague, May 16, made it plain to the Allies that the subject races of the Dual Monarchy were one in demanding liberation. Other evidence of the wholeheartedness with which Czechoslovaks were ready to give proof of their support of the Allies' purposes was furnished by their equipping troops for the Allies' armies. The most important Czech unit was the corps formed of Czech prisoners in Russia after the revolution. This took part in the fighting on the eastern front in July, 1917, and then, after the collapse of the Russian Army, undertook an astounding and almost mythical journey through the heart of Siberia in 1918 to join the troops on the western front. In the West, in December, 1917, a Czechoslovak unit was recognized; on the Italian front, the same steps were taken. Beginning with the summer of 1918, one after another of the Allies recognized Czechoslovakia as of their number and the National Committee as its *de facto* government; the United

States did so on Sept. 3, 1918. On October 7, the Dual Monarchy formally accepted President Wilson's statements as a basis for negotiation; on October 14, Beneš announced the establishment of a Czechoslovak government, and its principles were promulgated on October 18; on the same day, President Wilson declared to Austria-Hungary that no negotiations could be undertaken without the recognition of Czechoslovakia's and Jugo-Slavia's independence; on October 17, Andrassy accepted for the Dual Monarchy and in so doing dealt Austria-Hungary its deathblow.

Czechoslovakia was now a European state. Its first national assembly met at Prague, Nov. 14, 1918, welcomed the Slovak delegates, elected Masaryk first president by acclamation, and set up a cabinet with Dr. Kramář as Premier and Dr. Beneš as Foreign Minister. Dr. Kramář and Dr. Beneš were delegated to represent the country at the Peace Conference. The conflicting claims of self determination and historic rights have already been alluded to: in these centred the leading difficulty before the Peace Commissioners with respect to Czechoslovakia. The old Czech kingdom had included the whole of the provinces of Bohemia, Moravia, and Austrian Silesia; within these there were now 3,500,000 Germans, constituting 37 per cent of Bohemia's population, 28 per cent of Moravia's, and 44 per cent of Silesia's. It was therefore with some hesitation that the Supreme Council decided to yield to the demand for historic justice, instead of racial, and created a state embracing so great a number of a minority and antagonistic people. Ample grounds were to be found for the decision; the Czechs had after all come to the country first, while the Germans had been colonized there; the boundaries had to be kept intact for strategic reasons; economic considerations, such as the convergence of the rivers toward the centre of the country, and German Bohemia's being an industrial centre and thus serving to complement the agricultural districts of the rest of the country, favored the move. In the case of Slovakia, historic rights were ignored in favor of Czechoslovak claims, and the Danube was accepted as the southern frontier in spite of large Magyar minorities on the left bank. In Ruthenia, in 572,028 inhabitants, there were 319,361 Ruthenes, 169,434 Magyars, 62,187 Germans, and only 4057 Slovaks, and the request of certain delegates of Ruthenians resident in the United States for union with Czechoslovakia was far from convincing; but as the Allies wished to establish direct territorial contact between Czechoslovakia and Rumania, and above all to prevent the future union of so strategically important a region as Carpathian Ruthenia with Russia or Ukraina, ethnic ties were ignored, and the area was assigned to Czechoslovakia, with treaty stipulation for autonomy, a separate diet, and the retention of the Ruthene language. Only in the Teschen, Zips, and the Orava areas in the north was the boundary left undetermined; the Treaty provided for plebiscites there. The Czechoslovak commissioners also effected the internationalization of the Elbe, the use of free zones in the ports of Hamburg and Stettin, and the reconstitution of the European Commission of the Danube.

The National Assembly continued to sit until the framing and adoption of the new constitution, Feb. 29, 1920. This document, which

showed largely the American and French influence, provided for a president, a parliament of two houses, and a judiciary somewhat on the American plan. The President was to be elected for seven years by both Houses in joint session, was to represent the Republic in its international relations, to head the army, and to have the power to summon, prorogue, and dissolve Parliament. He did not have the right of veto. Both Chambers were to be elected by universal manhood and womanhood suffrage, on the basis of proportional representation. The Chamber of Deputies was to have 300 members; the Senate, 150. Declarations of war and amendments to the constitution might be passed only by a three-fifths vote of all the members of both Houses. Finance and army bills were to originate in the Lower House. Cabinet ministers, 15 in number, were to be appointed by the president and to be responsible to the Parliament. During the intervals between sessions, a permanent parliamentary commission was to exercise the legislative power. A constitutional tribunal was to pass on the constitutionality of laws; there were to be special benches in the case of litigation in mining matters; and industrial courts were provided for labor disputes.

In the elections of April, 1920, no less than eleven parties returned representatives to the Chamber or the Senate, or both, the vote by nationalities being: Czechoslovaks, 4,203,480; Germans, 1,576,692; and Magyars, 274,630. The Social Democrats had by far the largest deputation, 74 deputies and 41 senators, although 22 deputies and 5 senators broke away to form a Communist wing. A Social Democrat, V. Tussar, accordingly formed a ministry, on July 8, 1919, succeeding Kramář. On Sept. 15, 1920, Tussar was succeeded by Jan Černý (National Democrat), as a result of a split in the Socialist Party. Černý in turn gave way to Beneš (Independent) on Sept. 26, 1921, and Beneš to the Agrarian A. Švehla on Oct. 8, 1922. In all these cabinets, the portfolio of foreign affairs was held by Dr. Beneš. The cabinets included representatives of all Czechoslovak parties except the extreme left.

The Švehla cabinet, which remained in power some years, rested on a coalition of five parties, the Agrarians, Social Democrats, Czechoslovak Socialists, National Democrats, and People's Party (Clericals). The problems confronting the leaders of the young state were indeed grave. Food and clothing were scarce, the cost of living high, the coal shortage serious, the rate of exchange unfavorable, and the transportation system, because of the studied plan of Austria-Hungary, hopelessly inadequate. But the economic snarl slowly disentangled itself so that from 1922 on Czechoslovakia presented the pleasant spectacle of a country at work, with high wages, and an appreciating currency. The well-being of the workers and rural laborers was zealously provided for in elaborate codes of social legislation. Cultural problems were less easy of solution. The problem of racial minorities cut deeply. The superior attitude of the Czechs toward the Slovaks brought increasing dissatisfaction until it reached the point where an autonomous movement made much headway. The Germans, the most cultivated and industrialized of the races of the country, were treated harshly, and they and the Magyars were hard hit also by the expropriation of the land in favor of the

small farmer. As for Ruthenia, it was not until March, 1924, that elections were held in the provinces for representatives to the National Assembly.

Educational and religious differences contributed to domestic friction. The relentless Magyarization in Slovakia and Ruthenia had left the larger part of the population illiterate, whereas in Bohemia and Moravia educational standards were high. In 1920 as a result of the "Away from Rome" movement, which contended for such changes in Roman Catholic practice as abolition of celibacy, the use of the vernacular in church services, and a more democratic church administration, all of which the Pope naturally refused to countenance, dissatisfied bodies founded the Czechoslovak National Church. By the 1921 census, 120 churches and 525,313 communicants were recorded. The political significance of the act lay in the fact that the Church was being supported by the Czechs, while the Slovaks, who were the most pious Catholic peasantry of Europe, regarded it with hostility.

In the national Parliament, these differences combined with other divergencies in political belief to produce such strains in the coalition government as to make it difficult for the cabinet to hold together. Toward the close of 1924, the Slovak, German, Hungarian, and Ruthenian delegates, representing the racial minorities, walked out of Parliament. In spite of its lack of unity, however, the Government retained sufficient strength to initiate and carry forward a comprehensive financial reorganization, under which expenditures were presently cut down and the yearly budgets began to show continual small surpluses. As one of the new features, a national bank authorized to issue currency on a gold-redemption basis was established. The Government was able also to put through a number of measures for the better protection of the working classes. In the session ending in June, 1924, Parliament passed laws to guard tenants against excessive charges by landlords and to widen the scope of unemployment insurance. In October, 1924, it passed a noteworthy act providing for sickness, disability, and old-age benefits for workers, the cost to be met by equal premiums from employer and employee, and by government subsidy. In May, 1925, a complementary law was passed which applied these benefits to independent, non-salaried workers. Taken together, these various acts constitute one of the most comprehensive sets of social-insurance safeguards to be found anywhere in the world. While Socialist influence was pressing this legislation, the Agrarians were demanding a protective tariff on agricultural products. Opposition by the Social Democrats, one of the coalition parties, prevented passage of the measure in 1924, but in 1925 they agreed to the imposition of duties when prices went below the cost of production. The issue was not settled, however, and it continued to be a disintegrating force within the coalition. The Government was still further weakened by a revival of the religious controversy. Among the reforms which the coalition Government was anxious to push was the further separation of church and state. With its precarious support, it could do no more than pass an act providing for certain national holidays in place of a number of church holidays. When the Government officially participated in the celebration of the John Huss anniversary on July 6, the Vatican promptly protested and withdrew the papal nuncio from

Prague. Shortly thereafter, the Government's representative to the Vatican also was recalled. The clash was echoed in the cabinet, from which a Socialist minister resigned.

The elections toward which events had long been tending soon became inevitable. They were held in November and resulted in a small reduction in the number of seats held by the coalition parties, bringing their combined vote in the Lower House down to 146, or less than a majority of the 300 members of that body. The Czech Agrarians still led all other parties with 45 seats. The Clericals held 31 seats, the Social Democrats 29, the Czechoslovak Socialists 28, and the National Democrats 13. In order that a government might be formed, these five parties were joined by a sixth, the Middle Class or Traders' Party, with 13 seats. The Communists with 41 seats were numerically the strongest of the several opposition parties. In December, M. Svehla succeeded in forming a new coalition government, but it was felt to be only a temporary arrangement. A new alignment of political forces was in fact in process, marked among other features by the tendency of the Germans and other racial minorities to draw closer to the national Government, whose authority was thus more consolidated than at any time since the establishment of the Republic.

On Mar. 17, 1926, M. Svehla resigned, partly because of illness and partly because of a failure to solve questions of pay for state employees and an additional tax on grain, and the Socialists, alienated by a revival of the proposed measure for flat agricultural tariffs, left the coalition. A new cabinet, made up of officials, was formed by former Premier Cerny, but it was admittedly a provisional and stop-gap government.

The anomalous political situation furnished just the right soil for the germination of the seeds of Fascism which were abroad in the land. In May, a demonstration was held in Slovakia, where the Fascists championed the Slovak demands for autonomy. The disaffected elements there and elsewhere, however, failed to rally to the Fascist cause and the movement presently subsided as an imminent threat. The political ferment of the times was reflected in an exceedingly stormy session of Parliament, which adjourned in June after passing the agricultural tariff measure and others of some importance. In October, the changes which had been proceeding in political sentiment received formal recognition when M. Svehla, partially restored to health, again took the helm with a cabinet which included, notably, representatives of the German Agrarians and the Christian Socialists. The temper of the new Government was markedly bourgeois-conservative and the Socialists were largely carried into the opposition. Among the noteworthy reforms effected by the new Government was the establishment of a system of local administration in the provinces, which to a great extent quieted the demands of the Slovaks for autonomy.

In 1927 the first seven-year term of Dr. Masaryk as President expired. In spite of his immense popularity throughout the country, his reelection for a second term was strongly opposed by conservative elements as well as by the Communists. However, on May 27, he was reelected by the two Houses of Parliament, receiving 274 out of a possible 432 votes, or 16 more than the required three-fifths. For the Communist candidate, 54 ballots were cast, and 104 ballots were blank. In a speech delivered in October, Presi-

dent Masaryk declared that, aside from the revolution itself, land reform was the outstanding achievement of the Government. That the position of the cabinet was more conservative than the general sentiment of the country was indicated when it was forced to modify materially a bill to amend the workmen's insurance act before the bill could be passed, and also when the elections to the legislatures of the provinces showed marked Socialist gains. The result was attributed in part to a reaction against governmental repression of Socialistic activities.

Slovak indignation rose high in December, 1928, when Professor Tuka, a Slovak member of the Lower House, was arrested on charges of espionage and high treason. On Mar. 2, 1929, Alexander Mach, secretary of a Slovak national organization, also was arrested. Because of long-continued ill-health, Premier Svehla was forced to resign, Feb. 1, 1929, and was succeeded, without a cabinet reorganization, by M. Franz Udrzal, Minister of War.

The foreign policy of Czechoslovakia was perforce bold, in view of the new nation's situation as a landlocked state almost surrounded by a cordon of hostile neighbors. In its international relations, it was guided by two principles, the maintenance of friendly relations with the Entente and with France first and then with Italy, and the creation of a group of conventions with the succession states of Austria-Hungary for the preservation of the *status quo*. With the aid of France, the military establishment was perfected; in 1921 a military accord between the two powers was formed; on Jan. 25, 1924, after lengthy pourparlers between Poincaré and Masaryk, and Beneš, a political alliance with important implications was signed. This included a pledge on the part of both nations to maintain the peace treaties and to prevent a Hapsburg restoration; promises of mutual support, but without definite military commitments; the upholding of the League of Nations; arbitration in the case of disputes, and a new commercial convention. Though Beneš succeeded in convincing Great Britain that the intent of the treaty was pacific, by Germany and Italy the whole was regarded with suspicion, while Austrian and Hungarian comments were plainly querulous. In order to offset this increase of French influence, Italy, on May 28, concluded a treaty with Czechoslovakia providing for cordial relations between the two countries, close adherence to the Peace Treaties, arrangements for possible concerted action in case of war between either country and a third power, and defense of mutual interests.

The creation of the Little Entente in Central Europe was largely the work of Beneš. By a series of bilateral conventions formed in 1920 and 1921, Czechoslovakia, Yugoslavia, and Rumania united to preserve the peace in central Europe, to further the maintenance of normal economic relations, and to block consistently all attempts at reaction, in Hungary and Austria particularly. (For the character of the alliance and its achievements, see *LITTLE ENTENTE*.) A political convention of a similar nature was signed with Poland in 1921. Relations with Poland, however, continued strained because of frontier disputes. But, in 1923, the chief point of controversy, involving the village of Tavorina, was referred to the League of Nations which decided in favor of Czechoslovakia. Friendly feelings between the two countries were completely

destroyed by a series of treaties signed in 1924 and 1925. Czechoslovakia regarded with suspicion all attempts at a Hapsburg restoration in Hungary; it objected, too, to the proposed union of Austria and Germany, or a Danubian confederation. In the field of commercial relations, treaties and trade agreements were concluded with almost all the country's European neighbors and with the United States on the basis of the most-favored-nation clause. In Russian political affairs, Beneš steadfastly refused to intervene, but in 1921 unofficial missions were exchanged between Russia and Czechoslovakia, and on June 5, 1922, a commercial agreement similar to the Anglo-Russian arrangement was concluded, opening the vast but disorganized Russian market to Czech enterprise. In September, 1923, Czechoslovakia was elected as one of the smaller nations to be represented in the League of Nations Council. This was in line with the understanding insisted upon by the Little Entente and agreed to by the League, that at least one member of the Entente should at all times have a seat in the Council.

Czechoslovakia continued to make support of the Little Entente the central feature of her foreign policy, and worked to strengthen the alliance and broaden its scope. In 1925 the country participated in the Locarno Conference, the result of which was to render more secure Czechoslovakia's position in the midst of the jealousies and rivalries of Central Europe. As a specific outcome of the Conference, Czechoslovakia signed a general arbitration treaty with Germany. This was followed, in 1926, by a comprehensive arbitration treaty with Austria which made arbitration practically obligatory in all disputes which could not be settled through the usual diplomatic channels, and created a permanent arbitration board from which appeals could be taken to the Hague court. Arbitration treaties with other countries also were negotiated, including Denmark, Sweden, Spain, and the United States, and Czechoslovak relations generally were placed on a friendly basis with all countries except Hungary. Advances made by Dr. Beneš toward Hungary met with little or no encouragement although they indicated a willingness to make territorial readjustments in favor of Hungary and to accept a settlement of the monarchical question which did not bring back the direct Hapsburg succession to the throne. The opposition of the Little Entente, led by Czechoslovakia, to revision of the Peace Treaties continued to be the chief obstacle to friendly relations. A tariff agreement, however, based on the most-favored-nation principle, was signed with Hungary in 1927.

In 1928 negotiations were begun looking to the broadening of the scope of the Little Entente agreement. Meetings of parliamentary representatives of the three countries were held to discuss an extension of the political understanding to other fields, particularly economic. In February, 1929, an economic conference of representatives of the three nations was held at Bucharest to prepare agenda for the spring meeting of the Little Entente in Belgrade. When this meeting was held, in May, no definite agreement was reached and up to the middle of 1929 the three countries were still only preparing the ground for possible future action. While the February conference was proceeding, a statement was issued by Czechoslovakia strongly opposing the proposed "anschluss," or union

between Austria and Germany, on the grounds that the international balance of power in Europe would be disturbed by the creation of so powerful a German state. On Jan. 26, 1929, President Masaryk signed, for Czechoslovakia, the Kellogg treaty outlawing war.

**CZECHOSLOVAK LITERATURE.** The problems which the Czechoslovak Republic has been called upon to face have been in many ways less complicated than those confronting some of her neighbors and this is reflected in her literature. In fact, any consideration of the Republic must start with her President, Thomas G. Masaryk, the philosopher statesman who has been able to steer the course of the country from the very beginning of the World War. His own writings, speeches, memoirs, and philosophical works, together with those of his associates, as Edward Beneš, play a very important part in the production of the country. Passing over these, it is in the field of lyric poetry that the Czechoslovaks have most distinguished themselves. There is a large number of poets many of whom have not become known abroad who have been of high standing. Among them we may mention J. S. Machar, and Viktor Dyk, both of whom were imprisoned by the Austrian government during the War. Among other poets were Antonín Sova and Otakar Theer. R. Medek was the chief poet produced by the Czechoslovak Legions in Siberia. Still others were Stanislav K. Neumann, Otakar Fischer, Jozef Chaloupka. Otakar Březina, a mystic poet of remarkable power, has practically stopped writing, although he remains one of the most significant figures in Czech poetry.

As regards Slovak poetry, Hviezdoslav (Pavel Országh), the foremost author, died in 1918 and his place has been taken, if not filled, by many of the younger generation, as the Rev. Ignac Grebač-Orlov, Jan Jesenský, Ludmila Podjavorinská, and others.

In the field of the novel, Czech literature suffered a great loss in the death of Karel M. Čapek-Chod in 1927. A profound pessimist, and at one time a man almost devoted to determinism of a particularly unpleasant kind, he was a master of psychology, and more than that he knew thoroughly the capital city of Prague. His novels, as those of Anna Tilschová, Alois Jiríšek F. Srámek, V. Vančura, and others, are at times of national rather than international appeal and for that reason they have not been recognized abroad as much as they should. This is not true of the foremost Czech author, Karel Čapek, the dramatist, not to be confused with the older novelist. His dramas, as *R. U. R.*, the *Insect Comedy*, and the *Makropoulos Affair* have gone into many foreign countries and his essays, as *Letters from England*, show that he has a real gift for satire. Karel Čapek is an author who questions the value of the machine world and constantly feels that mankind is in danger of becoming the victim of its own inventions. He is still a young man and he bids fair to become the leading author of modern Europe.

As regards Slovak prose, since the death of Svetozár Hruban Vajanský in 1916, no outstanding figure has appeared with the possible exception of Milko Urban, who published the *Living Whip* in 1926. As elsewhere, the tremendous ferment of liberation encouraged a mass of production, but life is only now quieting down sufficiently for an atmosphere favorable to careful prose work to develop.

# D

**D'ABERNON, EDGAR VINCENT.** See ABERNON, EDGAR VINCENT D'.

**DADAISM.** A literary and artistic movement started by an international group of artists and writers who met at the Café Voltaire in Zurich during the World War. The manifesto of Tristan Tzara, the leader, was largely meaningless, some of the clearest passages being: "I am neither for nor against, and I do not explain, for I hate sense. . . ." "DADA means nothing." "We want works, straightforward, strong, accurate, and forever not understood. Logic is always wrong. . . ." The idea, which ended in senselessness, was to adapt the forms of literary and artistic expression to suit the trend of the times; because of the great need for something new after the War, and because of the eccentricities of the movement, such as holding meetings at which authors, in reading their works, tried to shout louder than a jazz band or a large electric gong, the Dadaists succeeded in holding public attention for several years after 1920, when their first meeting in Paris was held. Complete meaninglessness was the only rule—all who complied with this were hailed as Dadaists, and all were presidents. Dadaist poetry consisted largely of letters or syllables repeated in such a way as to make no sense, but usually so that some rhythm was retained. The tendency in the other arts was also to abandon traditional methods and forms, and there were even attempts to make it a political creed—a sort of super-anarchism. The name taken by the movement was given several origins: it was purposely devoid of sense; it was the name of a dead café singer; Tsara opened Larousse at random and a green hand pointed to the word Dada, which seemed to him a supreme title in that it glorified the first word the infant speaks as the highest art. Some of the chief members of the movement were Francis Picabia, André Breton, Philippe Soupault, Paul Morand, Georg Groz, Adolf Knoblauch, Richard Hülsenbeck, and Kurt Schwitters.

**DAEGER, ALBERT THOMAS (1872- )**. A Roman Catholic archbishop, born at New Vernon, Ind., and educated at Saint Francis College, Cincinnati, and in several houses of the Friars Minor. He was ordained to the Roman Catholic priesthood in 1896, and from that time until 1919 was connected with various churches in Missouri, Nebraska, and New Mexico. In 1919 he was consecrated Archbishop of Santa Fe, N. M.

**DAFOE, JOHN W. (1866- )**. A Canadian journalist (see VOL. VI). In 1919 he was the representative of the Canadian Department of Public Information at the Paris Peace Conference. He is the author of *Laurier: A Study in Canadian Politics* (1922).

**DAHLGREN, ULRIC (1870- )**. An American zoölogist born in Brooklyn, N. Y. He was educated at Princeton University, and was instructor in biology (1895-99), assistant professor (1899-1911), and professor of biology (1911- ) at Princeton. In 1921 he was di-

rector of the Mount Desert Island Biological Laboratory, Bar Harbor, Me. Professor Dahlgren published (with Kepner) *Principles of Animal Histology* (1908), *Production of Light by Organisms* (1915), and various shorter papers, mostly on electric and luminous organs of fishes.

**DAHOMEY.** A French colony on the west coast of Africa between Togoland and British Nigeria, forming part of the Government General of French West Africa. Its area is 42,460 square miles and its population in 1925 was 979,609, of whom 900 were Europeans. The capital and chief business centre is Porto Novo, with an estimated population of 25,000. Other cities are Abomey, Whydah, and Kotonu. Palm kernels and palm oil are the products of greatest economic value. Cotton cultivation was successfully introduced in the central provinces. Imports in 1926 were 186,537,810 francs and exports, 181,704,213 francs. In comparing these with the 1911 imports of 10,524,531 francs and exports of 21,958,301 francs, account should be taken of the fall in value of the French franc during the period 1914-28. Germany's share of the palm-kernel trade was largely absorbed by Great Britain after the War. In 1926 the local budget balanced at 19,102,000 francs. The natives remained orderly during the War and many served in the carrier contingents doing duty in Europe and the Cameroon.

**DAIL EIREANN.** See IRELAND.

**DAINGERFIELD, ELLIOTT (1859- )**. An American painter (see VOL. VI), head of Permanent Art School, Blowing Rock, N. C. His work, as exemplified in "An Arcadian Huntress," is pervaded with poetic meaning. Among his later pictures, "The City That Never Was" and "Tower of Silence" were imaginative impressions of the Grand Canyon. In 1914 he published *Ralph Albert Blakelock*.

**DAIRYING.** The production and use of dairy products has continued to make steady advancement. The public has become better educated to a more complete realization of the food value of dairy products, and consumption has consequently been stimulated. Producers and dealers have come to exercise greater sanitary precautions in the production of milk and the manufacture of its products. Pasteurization now is almost universal in the milk supplies of the larger cities, the ordinances of many of the cities allowing no raw milk to be sold. The spread of contagious diseases transmitted in milk has been reduced to a minimum. The manufactured dairy products have become better known and more fully appreciated by increased advertising and by marketing products of more uniform quality and in a more attractive way. A wider use of brand names for advertising purposes is also employed. Cheese and ice-cream consumption has been tremendously increased in this way. It has been suggested that prohibition also played a part in the increased use of ice cream and milk drinks. United States Department of Agriculture estimates indicate that

the per-capita consumption of dairy products expressed in terms of whole milk has reached more than 1000 pounds a year.

The continued development of coöperative and other organizations of milk producers brought more independence in transactions with milk dealers and the receipt of better prices for milk. Since the first real stand of the dairymen against the dealers, in October, 1916, when the Dairymen's League of New York State declared a strike pending the adjustment of milk prices for the ensuing six months' period, many coöperative organizations were rapidly established and now control large businesses, some of them going so far as to buy milk plants and to manufacture various types of dairy products.

Along with the development of coöperative marketing associations, producers also progressed profitably in the development of cow-testing associations, bull associations, etc. Such testing made it possible to distinguish the profitable from the unprofitable cow and served to demonstrate the importance of high producers. The bull associations made it possible for owners of small herds to obtain the service of better bulls at a reasonable cost. Pure-bred-sire campaigns and advanced registry testing in the different breeds of pure-bred dairy cattle also showed much progress. The increases in the cost of labor and feeds occurring during the World War made it absolutely necessary that milk prices be increased accordingly. The soundness of the dairy business was clearly substantiated in its ability to survive the period of depression following the War and continue as a relatively stable industry without the serious disaster that occurred in so many other agricultural enterprises.

Two matters of recent importance to the dairy industry were the creation of the Bureau of Dairy Industry in the U. S. Department of Agriculture, in 1924, which practically amounted to the elevation of the Dairy Division of the Bureau of Animal Industry to a place of equal recognition with the other bureaus of the Department; and the holding of the World's Dairy Congress in the United States in 1923 and another in England in 1928. Representatives attended both congresses from the larger countries of the world and discussed research, education, health, and economics as related to dairying. Aside from the World Dairy congresses just mentioned, the Scottish Cattle Breeding Conference, held at Edinburgh, Scotland, in 1924, was international in scope and of considerable interest to scientists working on dairy-cattle-breeding problems. The National Dairy Council represents many phases of the dairy industry and is devoted to the promotion of health and child welfare through the education of the public in dairy matters, under the directorship of Dr. C. W. Larson, former chief of the Bureau of Dairy Industry.

**International Conditions.** During recent years, certain of the European countries which formerly produced large amounts of butter, cheese, and other dairy products for export, have in a measure regained their former place in the world's dairy-products market which they lost during the War, and, in addition, there was a spectacular expansion in butter production in the Southern Hemisphere. The butter exports of Denmark in 1927 were the largest on record, and exports of cheese from The Netherlands, the world's greatest exporter of cheese, increased

from an average of 127,000,000 pounds before the War to 186,000,000 pounds in 1926. The exports of butter and condensed and evaporated milk from that country were practically doubled in the last five years. Exports of dairy products from the Baltic states, including Latvia, Lithuania, Estonia, Finland, and Sweden, approximately equaled the pre-war figures. In fact, practically all the northern European countries showed substantial increases in butter surpluses during the last few years. Australian butter exports are setting new records every few years, notwithstanding periodic unfavorable weather conditions.

The United States has shown a rapid change from an exporting to an importing country since 1922. In terms of the milk equivalent of the various products, the United States Department of Agriculture calculated an import balance of dairy products in 1922 of 106,000,000 pounds, but in 1926 and 1927 this was increased to over 1,100,000,000 pounds, with the probability of not quite such a large balance for 1928. The following table giving the imports and exports of dairy products of the United States in recent years, indicates that this change has largely been brought about by a considerable increase in the amounts of cheese imported and a reduction in the amounts of canned milk exported. It is of interest that this import balance is being established, notwithstanding the increase in the tariff on butter from 8 to 12 cents per pound, which was made effective in May, 1926. Present tariffs on butter, cheese, and milk have not eliminated New Zealand and Danish butter, Swiss and Canadian cheese, and Canadian milk and cream from the United States, but they have maintained a higher price for these products to the producer's advantage.

#### IMPORTS AND EXPORTS OF DAIRY PRODUCTS OF THE UNITED STATES

Year	IMPORTS		Condensed, evaporated, and powdered milk and cream
	Butter	Cheese	
	lb.	lb.	lb. (c)
1918	3,726,437	55,589,582	
1918	1,655,487	7,562,044	10,904,998
1919	9,319,368	11,332,204	16,509,239
1920	37,454,172	15,999,725	28,755,780
1921	18,558,888	26,866,464	8,667,626
1922	6,957,159	46,573,009	5,293,631
1923	28,741,247	64,419,788	10,888,001
1924	19,404,616	59,175,591	8,469,414
1925	7,212,013	62,402,706	12,393,769
1926	8,029,067	78,416,823	9,375,513
1927	8,459,741	79,796,042	10,358,469
1928	4,659,288	81,402,678	7,668,291
		EXPORTS	
1918	3,110,777	2,654,315	16,473,782
1918	26,194,415	43,404,672	551,139,754
1919	34,556,485	14,159,721	552,865,414
1920	17,487,795	16,291,529	414,250,021

1927	4,343,142	3,410,353	106,353,820
1928	8,893,157	2,599,944	119,567,857

\* Quantity not given in Commerce reports of United States.

**Trends in Research.** Mineral and vitamin studies have had a direct bearing on the nutrition of dairy animals as well as on the studies of the nutritive properties of dairy products. Work on the importance of minerals in the rations of dairy cattle was intensively carried on by E. B. Forbes at the Ohio Experiment Station,

E. B. Hart at the Wisconsin Experiment Station, and E. B. Meigs of the U. S. Department of Agriculture. These investigations tended to show the difficulties of keeping cows producing large amounts of milk in a positive calcium balance, even when plenty of calcium was supplied in the ration. The significance of the legumes, more especially alfalfa, as an aid to the maintenance of a positive calcium balance was first suggested from the Wisconsin Station and was later corroborated by other investigators. The proper curing of the alfalfa used is essential to prevent the partial or entire destruction of the vitamin which aids calcium assimilation. The Pennsylvania and Minnesota Experiment Stations found that dairy calves unlike many other animals were able to make normal growth and produce young on rations lacking in vitamin B, due to their ability to synthesize this substance in their digestive tract from the action of the fermentation bacteria normally present. Cows were, however, unable to synthesize sufficient vitamin B for the maintenance of normal milk production.

In studies of milk secretion, the Maine and Missouri Experiment stations found that from 70 to 80 per cent of the milk produced at a single milking was present in the udder before milking started, while the balance was secreted from cells of the mammary gland as the stimulation from milking proceeded. The Illinois Experiment Station found that the fat content of the milk could be increased by feeds or rations high in oil, the oil itself being responsible, and not the additional energy supplied or the specific action of the feeds. The limiting factor in milk production, however, was the energy produced in the milk.

Much attention was given to the composition of ice cream and the effects of the various ingredients of the mix and changes in the portions of the fat, and milk solids-not-fat, on the quality of the finished product and on the overrun. The part played by pasteurization, homogenization, and other special practices in the manufacture of ice cream was likewise studied.

From experimental work conducted over a period of years at the New York Geneva Station, an atlas was prepared which contained 16 microphotographs of methylene-blue preparations of market milk and cream. By the use of this atlas, it was possible to determine the previous treatment of the sample; for instance, pasteurized and raw milk may be differentiated as well as milk which was handled in poorly cleaned utensils or which was improperly cooled.

**Bibliography.** A few of the more outstanding recent publications in dairying include: *Proceedings of the World's Dairy Congress* (London, 1928); W. W. Yapp and W. B. Nevens, *Dairy Cattle: Selection, Feeding, and Management* (New York and London, 1926); C. W. Larson and F. S. Putney, revised by H. O. Henderson, *Dairy Cattle Feeding and Management* (New York and London, 1928, 2 ed., rev.); P. Coche, *La Production Laitière en Danemark* (Paris, 1928); J. W. Gowen, *Milk Secretion* (Baltimore, 1924); *Fundamentals of Dairy Science*, a treatise by associates of L. A. Rogers (New York, 1928); O. Rahn and P. F. Sharp, *Physik der Milchwirtschaft* (Berlin, 1928); L. L. Van Slyke, *Modern Methods of Testing Milk Products* (New York and London, 1927, 3. ed., ser.); A. Miyawaki, *Condensed Milk* (New York and London, 1928); O. F. Hunziker,

*The Butter Industry* (LaGrange Ill., 1927, 2d ed.); L. L. Van Slyke and W. V. Price, *Cheese* (New York and London, 1927); G. D. Turnbow and L. A. Raffetto, *Ice Cream* (New York and London, 1928); J. T. Bowen, *Dairy Engineering* (New York and London, 1925).

**DALLAS.** The leading wholesale market and manufacturing centre of Texas. The population rose from 92,104 in 1910 to 158,976 in 1920 and to 217,800 in 1928 by estimate of the Bureau of the Census. The area is 28.7 square miles. The first step in carrying out the city plan which was adopted in 1910 was the erection of the Union Station costing \$6,600,000 and an interurban station costing \$1,000,000. This was followed by the removal of railway tracks from Pacific Avenue so as to create a new main thoroughfare in the downtown district. Recently, about \$1,500,000 has been expended annually for opening and widening major thoroughfares. Three bond issues, totaling \$37,000,000, have been voted for carrying out, over a period of nine years, such projects as the elimination of grade crossings; the opening and widening of streets; the development of parkways and boulevards; the erection of additional school buildings, an art gallery, and a municipal auditorium; the purchase of an airport; and the extension of water, drainage, and sewer systems. A bond issue of \$500,000 has also been voted for enlarging the Dallas Public Library and for building several branches. Dallas has spent about \$250,000 in developing its park system, which covers more than 4000 acres. In 1928 10,000 acres of overflow lands were being reclaimed for business and industrial development along the Trinity River at a cost of some \$6,500,000.

The value of building permits in Dallas increased from \$13,755,219 in 1920 to \$34,849,558 in 1925; in 1927 the value of permits issued was \$12,053,333. Of special significance is the theatre erected by the Dallas Little Theatre, an organization which successfully produces amateur plays. The assessed valuation of property in 1928 was \$254,288,075; the net indebtedness \$20,824,261. The factory output of Dallas has increased from \$116,100,150 in 1920 to \$107,890,000 in 1927. In 1925 there were about 700 manufacturing plants that employed 9412 persons and paid \$11,104,000 in wages. In 1927 the wholesale business of Dallas was estimated at \$840,000,000 and the retail business at \$255,000,000. Dallas is the home of the Federal Reserve Bank of the eleventh district; its bank clearings in 1928 amounting to \$2,775,501,000. There are 45 elementary public schools, 7 high schools, several private schools, and one university, Southern Methodist University. The State Fair of Texas, the largest State fair in the United States, is held annually in Dallas. Several million dollars are invested in permanent improvements. A special feature is the auditorium, seating 5000 persons, in which grand opera is presented.

**DALLIN, CYRUS EDWIN** (1881- ). An American sculptor (see VOL. VI). He has in recent years continued his impressive Indian subjects in such works as "The Hunter" (1915), Arlington, Mass.; "Massasoit" (1921), Plymouth, Mass., and "The Last Arrow" (1923). He has succeeded also in the domain of historical sculpture in works like "Anne Hutchinson," State House, Boston, and the impressive relief, "Signing the Compact," Provincetown, Mass.

**DALMAN, GUSTAF HERMANN** (1855- ). A German Orientalist, professor of Old Testa-

ment Exegesis at the University of Greifswald (see VOL. VI). In 1917, he was appointed professor in the University of Greifswald, and in 1918 he became *Geheim-Konsistorial-Rat*. His works published since 1914 include: *Die Kapelle zum heiligen Kreuz und das heilige Grab in Gortitz und in Jerusalem* (1915); *Orte und Wege Jesu* (1921); *Das Grab Christi in Deutschland* (1922); *Jesus-Jeschua*; *Die drei Sprachen Jesu*; *Jesus in der Synagoge, auf dem Berge, beim Passahmahl, am Kreuz* (1922); *Hundert deutsche Fliegerbilder aus Palästina* (1925); and *Arbeit und Sitte in Palästina* (1927).

**DALMATIA.** See FIUME-ADRIATIC CONTROVERSY.

**DALRYMPLE, LEONA** (MRS. C. ACTON WILSON) (1884- ). An American author. In 1914, she won a prize of \$10,000 for her novel, *Diane of the Green Van*. Among her other stories are *Traumerei* (1912); *The Lovable Meddler* (1915); *Jimsy, the Christmas Kid* (1915); *When the Yule-Log Burns* (1916); *Kenny* (1917); "Paul" stories (1920); *Fool's Hill* (1923), and *A Fool's Bells* (a play, 1925). She also has written short stories for magazines, and moving picture scenarios.

**DALTON, ALBERT CLAYTON** (1867- ). An American army officer, born at Lafayette, Ind. He entered the United States Army as a private in the 25th Infantry in 1889 and was promoted second lieutenant two years later, and by successive advancements became brigadier general in the Quartermaster's Department in 1922. His services included participation in the campaigns against the Cheyenne Indians in 1890 and the Sioux in 1891; and in the Santiago campaign in 1898, as well as in the Philippines during 1899-1902, and on the Mexican border in 1916-17. During the World War, he organized the Army Transport Service from New York (1917-18) and in 1919 he was in France commanding the 9th Division. He received the Distinguished Service Medal for his services. He was assistant quartermaster general at Washington, 1922-26, and after 1926 was president and vice president of the U. S. Shipping Board Merchant Fleet Corporation. He is a graduate of the Infantry-Cavalry School (1895), the General Staff School (1920), and the Army War College (1921).

**DALTON LABORATORY PLAN.** See EDUCATION IN THE UNITED STATES.

**D'ALVIELLA, däl-vyel'lä, COUNT GOBLET.** See GOBLET D'ALVIELLA, COUNT EUGENE.

**DALY, THOMAS AUGUSTINE** (1871- ). An American writer born in Philadelphia, Pa. He was educated in the public schools and at Villanova College, Pa., and also attended Fordham University to the close of his sophomore year. He was associated with several newspapers, among them the *Catholic Standard* and *Times*, Philadelphia, and the *Evening Ledger* and Philadelphia *Record*. He is the author of the following books: *Canzoni* (1906); *Carmina* (1909); *Madrigali* (1912); *Little Polly's Pomes* (1913); *Songs of Wedlock* (1916); *McAroni Ballades* (1919); and two prose works, *The Wissahickon* (1922) and *Herself and the Houseful* (1924).

**DAMPT, JEAN (BAPTISTE AUGUSTE)** (1854- ). A French sculptor, born at Venarey (Côte-d'Or). After studying at Dijon, he came under the influence of Jouffroy in Paris, and in 1879 under that of Dubois. He then specialized in Italian art from 1882 until 1883. He exe-

cuted a statue of Diana and Actæon in 1887, but his popularity is due to his later work in gold and silver, and to his plaster statuettes. His sculptures are represented in the Musée du Luxembourg, by *Saint Jean Baptiste*, and in the museum at Dijon. Dampy is a member of the Académie des Beaux Arts.

**DAMS.** The period since 1914 has been marked by the construction of the greatest dams the world has ever known. Indeed, in 1929 designs were under way for even greater works than had existed and it would appear that the maximum size of dam which can be built is merely a matter of funds to meet its cost. At the beginning of the twentieth century, a dam 100 feet high was a high dam. Today, at least two projects call for dams 550 feet high. In 1900, when the Assuan dam on the Nile was under construction, 6400 feet long, it was rightly considered as one of the engineering wonders of the world. While it still retains its position as one of the longest, if not the longest, dam in the world, several others have been built which approach it in magnitude. Earth dams have grown from heights of 100 to 250 feet or more in extreme height. Of course, this remarkable activity in dam construction simply reflects the great economic demand for water facilities. Water supplies for domestic use, for irrigation, and for power have been so essential to modern life that the engineer has been called upon to build works of constantly increasing magnitude.

The period of service or estimated life of the structure, available funds, location, and particularly the foundation conditions, have been the determining factors in the choice of the type of dam built. The older gravity-masonry dam and the newer arch dam, the earth- and the rock-fill dams, as well as several still later forms such as reinforced concrete, slab, arch or dome types, are in use today. Timber dams are practically obsolete and the ill-fated steel dam has never been revived after its early failures.

In modern designs, particularly in America where labor is very costly, there has been a tendency toward reducing sections and taking chances on foundations. The recent warnings such as the St. Francis failure and several earth-dam slips have, however, caused a halt in this trend. It seems probable that the maximum in base pressure in masonry and on slopes in earth-dam design has about been reached, and that the future will witness a return to more conservative construction. In some cases at least, these recent difficulties have led to legal requirements and government approval of designs and projects for dam construction. It is quite possible that additional legislation may be forthcoming to hold in check the few engineers who succumb to the heavy pressure so frequently put upon them to reduce cost with the result that taking a chance ends in disaster.

**Gravity-Masonry Dams.** Where a long period of service is anticipated and where funds are available, this type of dam still retains premier honors as the most conservative, safest and long-lived type of structure. The St. Francis dam failure in 1928 in no way reflected on the well-established methods of calculation and design of the gravity dam. It simply showed again what has been known for many years, namely, that the gravity dam requires a foundation of equal quality to the masonry of the dam itself if the work is to be a proper con-

struction of this type. High gravity dams must be founded on solid rock. This often requires deep and costly excavation to clear out the foundation down to solid material. Furthermore, the deeper the foundation the higher the dam becomes and the greater its thickness. Hence, deep foundations mean costly construction. Economic pressure tends to use every means to reduce cost and the temptation to avoid excavating to solid rock, thus taking a chance, has sometimes proved too great to resist. It is also true that some dam sites do not afford suitable foundations at any depth for this type of dam. This, indeed, was probably the case at the St. Francis site. Topographic conditions are only one of the elements which make a true dam site—another equally important item involves a consideration of the geological features.

Recent years also have witnessed another important and perhaps dangerous trend in gravity-dam design. In the earlier days of masonry-dam design, a base pressure of 10 tons per square foot was considered reasonable. In the first great American gravity dam, the New Croton Dam (1892-1907), a maximum of 14 tons was allowed. For the Kensico Dam (1910-17), a very conservative design, the same figure was adopted. In the meantime, however, the pressure on the Arrowrock Dam (1912) had been allowed to go as high as 30 tons per square foot and several other successful designs with similar pressure were built. In 1928 the U. S. Reclamation Service proposed to design the huge Boulder Canyon Dam (550 ft. high), using 40 tons per square foot. An increased pressure of course results in a thinner section, in a saving in material, and a reduction of cost. That the early figures were unduly conservative is true, but it is significant that the report of a special commission, appointed by President Coolidge to review the Boulder Canyon project, recommended that 30 tons be adopted as the maximum in the design of this dam.

#### IMPORTANT HIGH GRAVITY-MASONRY DAMS

Name	Date	Depth of water (feet)	Maximum Height above foundations (feet)
New Croton (U. S.)	1892-07	150	297 (straight)
Lake Chresman (U. S.)	1900-04	...	232 (curved)
Wachusett (U. S.)	1900-06	...	228 (straight)
Cataract (Australia)	1902-08	150	192
Roosevelt (U. S.)	1905-11	240	280 (curved)
Olive Bridge (U. S.)	1907-17	210	252 (straight)
Kensico (U. S.)	1910-17	150	307
San Antonio (Spain)	1914-17	269	269 (curved)
Gamarasa (Spain)	1918-20	302	335
Don Pedro (U. S.)	1921-28	288	...

**Kensico Dam.** This structure, completed in 1916, is remarkable in several ways. It is a large dam, 307 ft. maximum height, unusual provisions were made in its design, its design has received more attention from the aesthetic standpoint than any other structure of its kind, and its construction was notably novel and rapid. The Kensico Dam forms a reservoir which occupies practically the entire watershed of the Kensico River—a small stream. It is an emergency reservoir on the Catskill water-supply system for New York City and holds a supply which would suffice for over a month should it be necessary to shut off the aqueduct for repairs. The valley below the dam is thickly built up with high-class suburban dwellings, and it was obvious that the dam had to be safe beyond all shadow of doubt. For this reason, all possible

forces were taken into account in the design. In addition to the usual water pressure acting from flood level (elevation, 360 ft.) against the back face of the dam down to the foundation level (lowest elevation, 70 ft.), allowance was also made for a possible ice thrust of 23.5 tons per linear foot acting at normal full-water level (elevation, 355) and for an upward pressure on the base varying from that due to two-thirds of the full hydrostatic pressure on the upstream face to zero at the downstream toe.

While many great dams have been built without any expansion joints, or as they should more properly be called, contraction joints, special provision was made in the Kensico dam for such joints. At intervals of 75 feet, joints extend entirely through the structure. The entire problem of shrinkage in large masses of concrete, the effect of contraction due to cooling after setting (the chemical action accompanying the setting of ordinary Portland cement causes a rise in temperature of 35 to 45 degrees above normal), and the effect of general temperature changes are all somewhat debated points in mass-concrete design which have been recently receiving much attention.

In planning for the construction of the Kensico Dam, the contractors, who took the contract for \$7,953,050, adopted a plan of construction using stiff-leg derricks fed by construction railroads running along the axis of the dam, instead of relying on the usual cableways. This scheme permitted much more rapid construction, and the dam was completed far ahead of schedule time. Almost a million dollars was spent on the plant for this construction. It was one of the first big jobs in which electricity was widely used, practically all the plant, except the locomotives used in hauling, being electrically operated with power transmitted some 15 miles from New York City. The contractors were also fortunate in finding a good market for their equipment after the completion of the dam—at the beginning of America's entry into the World War.

**The St. Francis Dam Disaster.** On the night of Mar. 12-13, 1928, the ends, or wings, of this 205-ft. high-arched gravity type of concrete dam, gave way, bringing death to some 450 people in the valley below, sweeping away a power house, bursting an aqueduct, and doing damage to roads, railroads, farms, etc., to an extent of millions of dollars. A central portion of the dam, about 100 feet long (the total length was 650 feet) remained standing, but both wings were wrecked by the release of the 38,000 acre-feet of water held in the reservoir, and the torrent, said to have been 100 feet deep, carried huge portions of the structure almost half a mile down the valley.

The dam was located in the San Francisquito Canyon about one and one-half miles above Power House No. 2 of the Los Angeles Municipal Power Bureau and roughly 45 miles north of the City of Los Angeles. Completed early in 1926 and built to provide storage for the Los Angeles aqueduct water for use in years of deficient run off, it was practically full at the time of failure. Although some seepage had occurred around the dam, an investigation the day before the disaster showed clear water with no indication of erosion.

In general, the reports of the many committees which investigated the failure agree in stating that the dam was of ample cross-section and was built of good materials, so that its failure

in no way reflects on the safety of this type of structure when built on adequate foundations. On the other hand, a fault, classed as dead and in which no movement took place at the time of failure, passes through the dam site and results in the adjoining rock masses being badly shattered. These rocks consist of a mica schist of very poor quality and a rock described as red conglomerate and supposed to have been formed of gravel loosely cemented with gypsum. Both materials, particularly the latter, have been found to soften under water. It is difficult, therefore, to state positively that any type of dam would have been absolutely safe at this site and it is even more clear that it was not a suitable foundation material for the gravity type which requires a solid bed-rock base due to the high and unequal pressure exerted by this particular type of dam on its foundation.

**Hetch Hetchy Dam.** Another important dam for domestic water supply is this structure located on the Tuolumne River, California, about 250 miles east of San Francisco, and at an elevation greater by 3600 feet. It was built as a straight cyclopean masonry-gravity section dam 600 feet in length with a siphon spillway. From the crest of the dam to the lowest excavation, it was 311 feet in height, and the dam rises to a height, above stream level, of 212 feet, there being an average excavation of 72 feet.

**Don Pedro Dam.** The highest curved gravity type of dam in the United States, and in fact one of the highest dams of any kind was completed in 1923, across the Tuolumne River in California. This dam was built on a simple curve with a radius of 675 feet and a height of 283 feet above stream bed. It is 1040 feet long on the crest and contains 282,000 cubic yards of concrete masonry. Spillway openings with a capacity of 100,000 second-feet are provided by means of 10 gates, each 58 feet long and weighing 22 tons. These gates sink into the lip when not in use and can be raised to increase the reservoir height by nine feet. There was also a power house built at the toe of the dam which was equipped for an initial capacity of 150,000 horse power. The Don Pedro Dam forms a reservoir four miles above the La Grange Diversion Dam for the joint use of the Turlock and Modesto Irrigation districts in the San Joaquin Valley, California. Its estimated cost was about \$4,-

000,000. The reservoir when full covers an area of 3068 acres, having a capacity of about 280,000 acre-feet. This dam is located about 60 miles below the Hetch Hetchy Dam of the San Francisco water-supply project.

**Wilson Dam.** The Muscle Shoals project to develop power by a dam across the Tennessee River was an important war-time undertaking put under way in 1918. The Wilson Dam—Dam No. 2 across the Tennessee—was a structure of the overflow type about 4600 feet in length from bank to bank and about 96 feet high from bed rock to pool level. It not only would supply power but would render adequate depth of water for navigation of the Tennessee River. The dam was founded on solid rock with two tandem locks, excavated in solid rock, 60 feet wide by 350 feet in length at the north end of the dam, each giving a lift of about 45½ feet and affording a minimum depth over mitre sills of 7½ feet. The spillway section of the dam is 2660 feet in length, and over its crest rise 8-foot piers which support a concrete arch bridge. In the 58 openings between the piers are vertical steel sliding-crest gates 18 feet high and 38 feet wide, which are sufficient to pass a flood 75 per cent greater than the highest ever known on the river without any appreciable rise in the upper pool level. The heel trench is 35 feet wide and is carried down below the base of the dam so as to give a minimum breast wall of five feet without any seams.

The power house proper is located in a section of the dam about 1200 feet long, which is a continuation of the spillway section and includes a building for housing the generating machinery. Here were to be installed at the beginning four 30,000-h.p. turbines, although power was available to generate from 300,000 to 375,000 h.p., and provision was made for a corresponding installation of turbines. This dam contains nearly 1,000,000 cubic yards of masonry and is one of the largest dams ever built as regards its volume. See **MUSCLE SHOALS**.

**Dams of U. S. Reclamation Service.** Some of the most important dam construction in the United States has been carried on by the United States Bureau of Reclamation, and its engineers have developed designs in which most of the leading types have been represented, as will

DAMS CONSTRUCTED BY THE UNITED STATES BUREAU OF RECLAMATION WITH HEIGHT OF 50 FT. OR MORE

appear from the accompanying table giving a summary of United States dams of over 50 feet built by the Reclamation Service. Up to the end of 1923, the Bureau had built three dams over 300 feet high, two dams between 200 and 300 feet, four dams between 100 and 200 feet, and nearly 100 dams ranging from about 2½ to nearly 100 feet in height. In 1924 there were six dams under construction, the most important of which were the Tieton River Dam in the State of Washington, with an estimated volume of 185,000 cubic yards, and a height of 244 feet (maximum height to the bottom of the core wall is 321 feet); the McKay Dam in the State of Oregon with an estimated volume of 2,300,000 cubic yards and a height of 159 feet; and the Black Cannon Dam in Idaho with an estimated volume of 74,500 cubic yards and a height of 153 feet.

The Arrowrock Dam near Boise, Idaho, built by the United States Reclamation Service in the interval between 1910 and 1916, has a height of 340 feet, and is 1100 feet long on the crest. It is built of concrete with large stones imbedded in the concrete. The total volume, including the spillways, is 610,600 cubic yards. Another high masonry dam constructed by the United States Reclamation Service was the Elephant Butte Dam across the Rio Grande, 120 miles above El Paso, Texas. This dam, which was finished in 1916, has a height of 306 feet above bedrock, and contains 605,200 cubic feet of concrete.

**Boulder Dam.** The United States Reclamation Service in 1924 proposed the improvement of the Colorado River Basin so as to provide adequate flood control, the impounding of water for irrigation, the storing of water for generating electric power, the provision of an all-American canal for supplying the Imperial Valley with irrigation water, and a possible future source of domestic water to supply California cities. An essential element of the project is the construction of a dam across the Boulder Canyon, raising the water surface 550 feet, a height equal to that of the Washington Monument, and twice that of the Don Pedro Dam in California.

The proposed dam would contain about three times as many cubic yards of masonry as the Assuan Dam in Egypt, which with 1,179,000 cubic yards had a record for the greatest amount of masonry of any dam yet constructed, though it was exceeded by the Wilson Dam with 1,291,385 cubic yards. The Boulder Dam would cost about \$50,000,000 or 2½ times as much as the Assuan Dam. It would provide a reservoir over 100 miles long with an area of about 150,000 acres, or 50 per cent greater than that of Gatun Lake on the Panama Canal. This reservoir would have a capacity of 26,000,000 acre-feet, over 6 times as great as that of Gatun Lake and about 10 times as great as that of the Elephant Butte Reservoir in New Mexico, the largest in the United States.

The dam as recommended in the Fall-Davis report, submitted in 1922, would begin 150 feet below the bed of the river, and would rise to a height of 605 feet, being 1350 feet long and 650 feet thick at its base. The so-called Boulder Canyon Dam Bill was not passed and signed by the President until late in 1928. In the meantime, the project had taken more definite form. The height was reduced to 550 feet. Special provision for floods was planned by

means of three diversion tunnels 35 feet in diameter in the solid rock of the canyon, which would by-pass the site of the dam. Even these estimates required modification according to the report of a special commission of experts appointed by President Coolidge late in 1928.

As finally passed, the Boulder Canyon Bill has certain requirements as regards approval by the several States concerned, refunding the cost of the all-American canal and securing a contract for the sale of the 1,000,000 horse power to be developed on favorable terms, which must be met before construction is begun. The cost was estimated at \$165,000,000, of which some \$70,000,000 was for the dam, and the bill carried an authorization for this sum to be advanced by the United States Treasury if and when the required conditions are met.

**San Gabriel Dam.** The Los Angeles Flood-Control District called for bids in November, 1928, for the construction of a high dam at the forks of the San Gabriel Canyon. This project has as its object the relief of flood conditions and the plans had been held up for over three years pending arrangements for financing. The dam site is about 30 miles east of Los Angeles at the forks of the San Gabriel River and the dam, a very high structure (425 feet above stream bed and about 500 feet above foundations) will be of the gravity-arch type. A storage capacity of 240,000 acre-feet will be developed and almost 3,800,000 cubic yards of concrete will be required (about three times the quantity used in the much discussed Muscle Shoals Dam). Irrigation water being much in demand in the area below the dam it is planned to serve for this use as well as for the primary purpose of flood relief. With this end in view, the lower 157,000 acre-feet will be used for impounding water for irrigation while the upper 83,000 will be held available at all times for flood relief through storage.

**Owyhee Dam.** At a point known as the Hole in the Ground about 21 miles southwest of Nyssa on the Union Pacific Railroad, the U. S. Bureau of Reclamation is planning to build a remarkably high gravity-arch type dam. A reservoir will thus be formed which will have a total capacity of 1,120,000 acre-feet and will form the principal storage for the Owyhee Reclamation Project embracing some 120,000 acres in eastern Oregon and western Idaho. Steep canyon walls permit a comparatively short dam, in the main portion about 300 to 500 feet with a top length of between 800 and 900 feet, to be carried up to the remarkable height of 520 feet above the lowest concrete of the deep foundation cut-off or an average of 390 feet above the general foundation level. Contraction joints will be placed at intervals of 50 feet in the length of the dam and inspection galleries will be provided in the body of the structure which will be 20 feet thick at the top and probably about 300 feet at the base. Following, as this work does, the St. Francis disaster, great attention has been paid to investigations of the foundation and experts have agreed upon this point. Work will be under way in 1929.

**Roller-Crest Dam.** The Grand River Dam, completed in 1915 to form a diverting structure of the high line or main canal project, was a pioneer American roller-crest dam. It is a steel roller crest surmounting an ogee gravity spillway section, with a sluiceway and a canal intake of a capacity of 1425 cubic feet per second at its

RECLAMATION SERVICE, IDAHO

west end. By means of this roller crest, the entire upper 10 feet of the dam can be raised above high water so that the elevation of the back water surface with low stream flow may be maintained at full height, yet the crest may be rapidly cleared to pass flood flows. The canal intake is controlled by nine regulator gates each 7 feet square. In front of the intake head walls is the sluiceway, 60 feet wide and 225 feet long. The dam proper consists of six sections, each 70 feet wide, or a total of 420 feet.

The roller crests consist each of a hollow steel cylinder, each 74 feet,  $9\frac{1}{4}$  inches long, and 7 feet,  $1\frac{1}{4}$  inches in diameter, the ends projecting about  $2\frac{1}{2}$  feet into recesses in the piers and rolled on smooth tracks at an angle of 20 degrees with the vertical, while a toothed rim engages in a toothed rack. The hollow cylinder axle and the required height of the crest are obtained by fastening to the cylinder an extension shield which rests on the sill when the roller is down, thus forming the bottom seal. There is also a roller crest at the sluiceway of essentially the same design but of different dimensions.

**Spanish Dams.** Spain, the home of the earliest existing dams of the gravity type, has been the scene of some remarkable recent dam construction. These works have been primarily for power purposes and have established the record heights for the Continent of Europe.

The San Antonio Dam was built in 1914-17 in Tremp, in the Spanish Pyrenees across the Noguera Pallaresa River, by the Ebro Irrigation and Power Company. It is located in a narrow gorge and is 269 feet high above foundations. In plan, this dam is curved, the radius of the upstream face being 300 meters. While the crest of the dam is only 666 feet long, it is an interesting structure because of its height and the special control gates and provisions for discharging floods. It is also typical of this type of construction in Spain.

The Camarasa Dam was built by the same company, across the same stream and for the same purposes, that is, combined use for irrigation and storage, as the San Antonio Dam. This dam built during 1918-20 when finished was not only by far the highest dam in Europe but also the highest gravity dam in the world. It rises to a height of 333 feet from bed rock to crest, and contains 285,000 cubic yards of cyclopean concrete. It is 270 feet wide at the base and 13 feet wide at the crest, which is widened to 21 feet to provide a roadway and foot walk along the top, whose length is 460 feet. This dam is of gravity section and is arched on a radius of 1000 feet. It forms a reservoir which supplies a head of water so that, at the power house, some 88,000 horse power is generated. The dam was built in a very narrow part of a deep gorge, so that it was necessary to place the spillway adjacent to the south abutment of the dam, and the headworks controlled the flow to the power house on the opposite side at the north abutment. At the power house, located below the dam, the total head of 270 feet was developed.

**Sukkur-Barrage, Bhatghar.** Construction began on one of the largest dams in the world in October, 1923, across the Indus River in the Province of Sind in India at Bhatghar, 35 miles from Poona. This dam forms a reservoir with a storage capacity of 551,000 acre-feet as compared with 1,070,000 acre-feet stored by the Aswan Dam in Egypt, and would provide water

for the irrigation of 6,000,000 acres of land, the entire project including about 850 miles of main canals and over 1200 miles with branch canals in addition to the dam, costing about \$50,000,000. The dam known as the Lloyd Dam, or Sukkur-Barrage, will be one mile in length and will be built of masonry using local limestone, with 66 arched openings of 60 feet each, provided with control gates. The height of the dam above the lowest foundation will be 185 feet and the height of the water above the sills of the lowest sluices will be 143 feet, a height which can be increased to 153 feet by means of gates in the waste weir. The masonry content of the dam will be approximately 800,000 cubic yards, and it will have two bridges on the top, the lower one directly over the water openings, carrying a roadway, while the other will be used for the machinery operating the gates. The Lloyd Dam takes the place of an older dam.

In connection with the Lloyd Dam, attention might be directed to the elaborate system of canals by which the water is distributed. The eastern canal at Nara is to be carried through a deep cut nearly double the width of the Suez, while the northeastern canal will be nearly 100 miles long and will have about 500 branches, being nearly as wide as the Suez Canal, and will irrigate more than 750,000 acres. The Central Rice Canal, which is the second largest, will be 87 miles in length, and will have 350 miles of branches. It will have a discharge equal to that of the River Thames.

**Arch Dams.** While many dams of the pure gravity type have been built curved in plan, instead of the usual straight top, this has been done simply as an increased factor of safety. On the other hand, certain locations have permitted the construction of true arched dams—practically horizontal arches or arches with the axis vertical. The deep narrow canyons of the western United States, with almost vertical side walls of solid rock, form the ideal site for this type of structure. Indeed it is an American development. Such construction permits a great reduction in the thickness of the dam section. Instead of a thickness at the base of two or even three hundred feet for high gravity dams, less than 100 feet may suffice for equally high arch dams. The Pathfinder Dam of the United States Reclamation Service (1905-10) and the Shoshone Dam, built at the same time by the same service, are notable examples of this type. The former has a maximum height of 210 feet and a thickness at the base of 94 feet while the corresponding figures for the latter structure are 328 feet and 108 feet.

This type of dam, properly designed, should be quite as long-lived and conservative a structure as a gravity dam, and it undoubtedly offers great economy of material. It has been quite widely used both in the United States and abroad and is such an important type today that special investigations have been undertaken to clear up disputed or uncertain points in arch dam design.

**Arch Dam Investigation.** In 1922 in the United States, the Engineering Foundation put under way a practical study and investigation of arch dams in order to learn as much as possible about their characteristics and performances in different conditions and temperature of depth of water in the reservoirs.

For the systematic investigation of arch dams, the committee appointed by the Engi-

neering Foundation in 1924, proposed to build a test dam 60 to 100 feet high, which was to be tested repeatedly during construction and under different conditions, and finally to destruction. The site selected was in Stevenson Creek, a tributary of the San Joaquin River, about 60 miles east of Fresno, Calif. This site was in conjunction with a U-shaped section, typical of many dam sites, and a stream gradient of about 25 per cent. It afforded a suitable foundation without an undue amount of stripping and was convenient and accessible. There was adequate water available derived from a tunnel from Shaver Lake which passed near by so that the reservoir formed by the test dam could be filled at will. This reservoir was not so large as to imperil life or property in case of the actual failure of the structure. This test dam was constructed, certain experimental results have already been secured, and the work is being continued.

**Hartebeestpoort Dam.** In September, 1923, the Hartebeestpoort Dam on the Crocodile River in South Africa was completed. This dam, situated about 23 miles from Pretoria, closes a gap in the Magaliesberg Range, and affords a reservoir with a surface area of about 6.7 square miles with a gross storage capacity of 136,241 acre-feet at spillway level, or 123,232 acre-feet above outlet level, having a drainage area of 1506 square miles, and an average annual rainfall of 26.34 inches. This dam is built of concrete in arch plan, 195 feet high, from the lowest foundation to the top of the solid parapet wall. It has a top radius of 240 feet on the up-stream face, and at the bottom the radius is 148 feet and 75 feet on the up-stream and downstream faces, respectively, affording a thickness of 73 feet. From the bottom, elevation 3795, to elevation 3960, both faces have a batter of 1 in 5.714, above which point they are vertical giving a roadway along the top.

The height of the dam from the river-bed level to the elevation of the crest of the waste weir is 140 feet, with an approximate height flood level of 158 feet to the top of practically 163 feet. At the west side of the gap, there was a flat slope which required the construction of a long tangent abutment beyond which the spillway was cut in the rock and separated from the reservoir proper by a levee, or weir, 420 feet long. This spillway was 56 feet wide at this upper end and increased in width to 125 feet at the bottom where it is crossed by a concrete arched bridge. The channel so formed is lined with concrete and beyond its lower end below the dam the rock surface of the cliff is faced with gunite. On each side of the dam there is an outlet tower from which through pipes the water is passed into an open canal, whence it proceeds for irrigation purposes to the territory below the dam. As the main road from Pretoria to Rustenberg crosses the dam, it has been made particularly ornamental as regards its finish and that of the bridge towers.

**Montejaque Dam.** In 1924 there was completed a concrete dam of pure arch type in the Andalusian Mountains of Spain, which with a maximum height of 273 feet from the lowest portion of the foundation to the crest was the highest structure of the kind essayed up to that time on the Continent. It was built across a gorge of the Gaduares River, where the cliffs rise almost vertically, and was of variable radius increasing from 72 feet at the base to 123 feet

at the crest which, measured along the centre line, was 256 feet in length. Excavation was begun in July, 1923, and the crushed stone and sand were obtained from adjacent sources of supply. The completed structure contained 35,000 cubic yards of concrete and formed a reservoir containing 1,412,000,000 cubic feet of water. The design was the work of Swiss engineers who also supervised the construction.

**Special Types of Masonry Dams.** It is obvious that there are many locations either not suited to the construction of masonry dams of the gravity or arch types or where considerations of cost exclude these types or even an earth dam. The twentieth century has witnessed several new types of dams designed particularly to meet these conditions. The principal forms are the reinforced concrete slab-and-buttress dam, the multiple-arch dam and, still more recently, a multiple-dome type.

**Slab-and-buttress Dams.** The slab-and-buttress type was first brought forward by the Ambursen Hydraulic Construction Company of Boston in 1903. It consists of a series of triangular buttresses, 15 to 20 feet centres and at right angles to the axis of the dam, the up-stream, sloping faces of these buttresses supporting inclined slabs of reinforced concrete. The highest dam of this type which we know is the La Prêle or Douglas Dam at Douglas, Wyo. This structure, completed in 1908-09, to impound over eight billion gallons of water for irrigation purposes, has an extreme height of 150 feet and is 135 feet high above the original water level.

**Stony Gorge Dam.** This work, a U. S. Bureau of Reclamation project, illustrates a more recent use of this type of dam. It is 120 feet high of the usual slab-and-buttress design of reinforced concrete and is being built by the Ambursen Company. By 1929 the dam had been practically completed, and is on the Orland project in California. It will furnish a supplemental supply to 20,000 acres already under irrigation.

**Multiple-arch Dams.** Another type of dam, the multiple arch, is similar to the slab buttress, the principal difference being that the slab between buttresses is replaced by an arch. This has an advantage in that concrete in compression carries the load and reliance does not have to be placed upon tensile steel reinforcement, as in the slab type. It is in this way a more conservative and presumably a longer-lived structure. At the same time, the thrust of one arch must be balanced against the adjoining arches and the failure of one arch may thus leave unbalanced thrusts and result in the failure of adjoining sections. The new edition of Wegman's well-known book, *Design and Construction of Dams*, published in 1927, includes a special article of over 100 pages on this type of structure and illustrates clearly the increasing use of the multiple-arch dam.

One of the earliest dams of this type was the Hume Lake Dam built in 1908. This dam had 12 arches of 50-foot span and was 50 to 60 feet high. It was followed in 1910-11 with the New Bear Valley Dam, replacing the old pioneer arch dam built in 1884. The new structure is 91.5 feet high and has 10 arches of 32-foot span centre to centre of buttresses. In more recent years, this type seems to have replaced in large measure the slab type dam and numbers of multiple-arch dams have been built. The Sherman

Island Dam, built in 1925, consisting of 31 bays, 19 feet centre to centre of buttresses with a maximum height of 80¼ feet, is typical of this type of dam.

**Lake Pleasant Dam.** A more recent American structure of this type is the Lake Pleasant Dam, Arizona, completed in 1927. This is 2146 feet long and its height, 170 feet above stream bed, shows the inevitable increase in size with an increase in familiarity with the type among engineers and an increase in confidence as to its structural stability and design.

In order to secure a sufficient cross-section for stability without undue use of materials, the novel expedient of building the buttresses of hollow form was used in this dam. They were 60-foot centres and were built with double walls 16 feet apart for their full height and battered inside. The clear span of the arches is thus 44 feet, the upper side of the buttresses being closed by flat slabs. The up-stream slope is 9 horizontal to 10 vertical, and the arches are 3-centred with a thickness varying with the height. The unique construction and the great height, 252 feet maximum above foundations, make this one of the most notable dams of this type.

**Tirso Dam.** Completed in 1923 in western Sardinia, Italy, this multiple-arch dam 200 feet high, was the highest dam of this type in the world, being almost 70 feet higher than the Lake Hodges Dam, which had the record for height in the United States. The Tirso Dam had reinforced-concrete arches supported on cut-stone masonry buttresses and formed the main structure of a power plant generating some 30,000 horse power at maximum load and 10,000 horse power normally. The dam itself forms a reservoir with a surface area of 8.5 square miles, which has a storage capacity of some 330,000 acre-feet, and will furnish irrigation water to about 75,000 acres.

The Tirso Dam in southern Italy, built in 1923, was exceeded in height by a new dam built in the following year for the Suviana Reservoir on the Limentra di Treppio Brook in the Province of Bologna, which has a height of 286 feet, as compared with 213 feet for the Tirso Dam. This was a concrete multiple-arch dam built for the State Railways of Italy, so as to afford a storage capacity of 35,000 acre-feet, of which 29,000 acre-feet was to be utilizable storage.

In the development of water power in Italy, a number of concrete multiple-arch dams of large proportions had been constructed, though they did not have the height of the two dams mentioned. Thus, the Pavana Reservoir across the Limentra di Sambuca Brook, also in Bologna, was formed by a concrete multiple-arch dam 187 feet high, and had a storage capacity of 810 acre-feet.

**Gleno Dam Failure.** Among the more serious of recent dam failures was that of a European multiple-arch dam at Gleno, about 30 miles northeast of Bergamo in north central Italy, on Dec. 1, 1923, resulting in a loss of some 500 lives and property destruction estimated at 150,000,000 lire. This dam, which formed a reservoir of 190,000,000 cubic feet capacity, was a reinforced concrete structure of multiple-arch type 143 feet in height above the stream, 863 feet long on top, and of curved ground plan, with a central portion 250 feet in length flanked on either end by straight portion tangents to the central curve. The multiple-arch construc-

tion rested on a gravity base of stone masonry, being substituted without proper authority for the gravity dam for which official permission had been granted. The masonry base was 5½ feet high and some 250 feet long and carried the curved part of the superstructure, while the straight portions at the sides were built directly on the rock of the side of the valley. In all there were 25 arches of semi-cylindrical form, 26 feet 3 inches between buttresses and inclined 53 degrees to the horizontal.

At the time of the failure, eight of the arches of the curved portion of the dam, together with their buttresses, and the first arch of the tangent section on the left bank together with the heavy buttress at the point of tangency went out. This released a vast volume of water which passed down the steep and narrow valley of the Dezzo River, for 12 miles to its junction with the Oglio River at Darfo, and then down the Oglio Valley 5 or 6 miles to Iseo Lake at Pisogne. Power stations at Vilminore, Dezzo, Mazzuno, Angola, and Darfo, a number of factories, including the Voltre Steel Works at Darfo, and many houses and villages were destroyed by the flood. The failure of the dam was due to the faulty design and construction of the base. The execution of the work was badly performed and there was a failure to cut footings in the rock for the buttresses. Improper materials, badly mixed and poured, lax inspection and incompetent direction, all contributed to the disaster as was revealed in an official report published in 1924. It was believed that one outcome of the catastrophe would be the formation of a government department to pass on the design and construction of all dams as had been proposed previously by different Italian engineers.

**Coolidge Multiple-Dome Dam.** One of the most interesting and remarkable dams of a novel type ever constructed is this work on the Gila River in Arizona. It is an essential part of a project authorized in 1924 to irrigate some 100,000 acres, largely Indian lands adjacent to the Salt River Project in Arizona, and was built by the United States Indian Service. Several studies of different types of dam, together with estimates of their relative economy, showed a slight saving for the novel dome type over its nearest competitor, the well-known multiple-arch. Three egg-shaped half domes of 180-foot span and 251 feet high, with joining buttresses, form the main portion of the dam which is about 550 feet long with side spillways on either end 166 feet wide. It is claimed that this type offers advantages for certain sites and is subject to comparatively simple calculation. The domes vary in thickness from 4 to 20 feet and are reinforced for temperature changes, no expansion joints being provided except in the buttresses.

**Earth Dams.** In many cases, the provisions for passing floods over dams require that practically the entire dam be made a spillway. In such cases, the gravity-masonry type is usually used. On the other hand, the spillway portion of a dam may be comparatively small or isolated from the main dam structure. In these cases, particularly where suitable material is available and foundations for a gravity type would require deep and costly excavation, the earth dam may be used. Until recent years, the earth dam has been employed primarily for long low dykes or embankments. Such a dam over 100 feet high was very unusual. Today, there is an

earth dam 245 feet high. This progress has been due largely to improvements in the development of the hydraulic method of construction.

Earlier earth dams in the eastern United States were built by depositing the earth in layers and compacting by rolling. At the best, this is a costly method of handling the large yardage involved in such construction. On the other hand, such dams in the West were built by sluicing the fill, from banks located above the level of the dam, by hydraulic giants or nozzles, through high pressure jets of water against the banks. The water, brought down to the dam in sluices, frequently carried 25 or 30 per cent of solids which settled out under water in the lake or pond maintained on the dam site by building up the edges, along the slopes, with special heavy coarse fill. This method of moving earth is extremely cheap but can only be used in a location where suitable earth is available at a level well above the top of the dam.

The following table gives some of the recent notable hydraulic fill dams:

Dam	Spillway ht. Total ht. above	
	above stream	stream bed
Cobble Mt., Mass. (1928)	215	245
Tieton, Wash. (1925)	211	232
Calaveras, Cal.	185	220
Saluda, River	200	208
Davis Bridge, Vt.	185	200
Neacox, Mexico (1909)	164	192
San Pablo	185	165
Goose Creek, Idaho (1913)	187	150
Paddy Creek, N. C. (1917)	120	130
Gasun, Panama (1912)	78	120

More recently it has been found economically possible to pump the liquid mixture of water, sand, and clay, from lower levels to the level of the work. Recent construction of earth dams of considerable height has, therefore, been almost entirely by the hydraulic fill method. Core walls of concrete have been very generally used, the function of the earth fills inside and out then becoming largely a matter of supporting this impermeable core wall. The stability of these slopes is a point of much importance and the several slips which have occurred in recent constructions seem to clearly indicate that the old ratio of 1 on 2 is not low enough for stability.

A record dam of the rock-fill-earth type is shown in the following table:

Dam	Spillway ht. Total ht. above	
	above stream	stream bed
Dix River, Kentucky (1926)	245	275

**The Wanaque Dam.** One of the most important of earth dams recently constructed in the eastern United States is this dam built to form a reservoir for the North Jersey water supply (Patterson, Passaic, Newark, and other cities). The dam closes a valley 1500 feet wide with rock outcropping on both sides but dipping 100 feet below ground at the bottom. A concrete core wall carries down to rock and the top of the dam is 92 feet above the original ground level. The principal interest attaches to the construction both of the core wall and the dam. The core wall was built in a sheeted trench 100 feet deep—a remarkable performance—and the dam, involving almost a million cubic yards of earth, was built by sluicing and compacting material brought to the site and distributed along the dam by a remarkable series of belt conveyors. The conveyors had a total length of nearly two and one half miles and constituted the largest

installation of this kind ever undertaken. An upstream slope of 1 on 3 was adopted with 1 on 2 reducing to 1 on 2½ downstream.

**Tieton Dam.** In order to provide a reservoir with a capacity of 205,500 acre-feet as a part of the storage system for the Yakima project, Washington, the United States Reclamation Bureau constructed an earth dam on the Tulon River about 26 miles above Naches, Washington, in the Mt. Rainier National Forest. This was an earth dam heavily blanketed with rock, approximately 230 feet high and 900 feet long on the crest, with a concrete core wall of an approximate height of 330 feet extended over solid rock to the crest. During the construction of the dam, a diversion tunnel 2200 feet long and of a diameter of approximately 21 feet was constructed to carry the waters of the Tieton River, and this work after the completion of the dam was to be used as a portion of the outlet control.

The embankment forming the dam consists of hydraulic fill blanketed with rock, having a maximum height of approximately 230 feet, a crest 900 feet long with a 3-to-1 slope on the upstream side, a 25-foot top width and a 2-to-1 slope on the downstream side. The material brought to the dam site from borrow pits in cars was washed into position by hydraulic giants to a central pool divided by the core wall. Here a pump was installed to pump a large amount of the soft clay material from the lower side of the core wall to the upper side, leaving a fine graded sandy material against the downstream side of the core wall and a clayey puddle against the upstream side of the core wall.

The volume of the embankment is approximately 2,000,000 cubic yards. In the rock cliff on the west side, a spillway was to be built with an overflow lip 420 feet long, equipped with six drum gates of the Arrowrock type, 65 feet long and 8 feet high. This spillway has a capacity under normal conditions of 30,000 second-feet and a capacity of 50,000 second-feet before the dam would be overtopped. It discharges through a concrete conduit down the side of the cliff to a pool well below the toe of the dam. The outlet control works operate to control the water at three stages so that the gates will never have to operate under a greater head than 80 feet. These outlets each have a capacity of 25,000 second-feet which will be the maximum of any irrigation dam.

**Cobble Mountain Dam.** This dam forms part of the additional supply system for the city of Springfield, Mass., being developed on Little River, a branch of the Westfield, west of the city and above the existing system. The dam is located in a narrow gorge and, although 1505 feet wide at the base (toe to toe) will be only 700 feet long at the crest. Some 22 billion gallons storage is expected and the lake will cover 1120 acres. A separate spillway 800 feet long is provided and a diversion tunnel, 1600 feet long, will be used to carry flood flows around the dam site during construction and later for an outlet to the dam. Another outlet tunnel, 7105 feet long and 9½ x 10 feet horseshoe section, will convey the water to a point lower down in the gorge at existing works giving a head of 450 feet for power development. Suitable material for the dam has to be hauled about one mile and will either be sluiced into place from "dissolving boxes" or placed by the

semi-hydraulic method of dumping dry at the outer edges and washing into place. It is expected that the work will be completed by October, 1930, and inasmuch as the dam will be 245 feet high above stream bed, it will be the highest earth dam in the world.

**Table Rock Cove Earth Dam.** That the stability of the earth embankments of a hydraulic-fill earth dam during construction needs careful observation and attention was amply demonstrated in the slide on the 180-foot Nexaca Dam in Mexico in 1909 and through other similar construction difficulties with this type. In the earth water-supply dam for Greenville, S. C., built in 1925-1927, however, another source of danger almost caused a major disaster. The dam was a rolled-fill embankment, not a hydraulic structure, and 140 feet high above foundations. A 42-inch drain pipe, used to divert the stream flow during construction, was closed by a valve at its lower end, at the downstream of the dam. A break in this drain which, of course, was under full water pressure, caused a large slide in the dam with the reservoir almost full. The dam held while the stored water was slowly drawn off.

**Dix River Rock-Fill Dam.** The record rock-fill dam, a western United States type, was built in 1923-1926 on the Dix River in Kentucky. In general, these dams have been built by first placing a rock fill across the stream. On the upper surface of this fill, a watertight diaphragm or apron is placed. In some cases, this has consisted simply of two layers of timber planking with waterproof paper between. Obviously a more or less temporary construction, this apron was frequently protected by an earth fill sloping upstream. In other cases, a sheet-steel diaphragm has been used. Reinforced concrete was obviously the ideal material, but due to the fact that rock fills of this type settle considerably, it was felt that a more flexible material such as timber or steel was indicated. Nevertheless, in the Dix Dam a reinforced concrete apron 18 inches thick has been employed. Almost two million yards of rock was blasted out near the dam and was dumped into the gorge between cliffs about 1000 feet apart. In this way, a barrier with slopes of about 45 degrees was built to a maximum height of almost 300 feet. On the upstream slope of this huge embankment, a heavy dry rubble paving was placed by derricks. Over this paving, the concrete facing or paving, furnishing the water-tight diaphragm, was built. Some 300,000 acre-feet of water, forming a lake 36 miles long, will be held back of this dam. It is part of the Kentucky Hydro-Electric Company's project for power development in this section and a new waterworks for Danville, Ky., also is involved.

**Bibliography.** Among the recent and more notable available works on dams are Wegmann, *Design and Construction of Dams* (8th ed., revised and enlarged, New York, 1927), which has a full bibliography of the available literature; Creager, *Engineering for Masonry Dams* (Rev. ed., 1929, New York, also translated into French); Morrison and Brodie, *High Masonry Dams* (2d ed., New York, 1916); Davis, *United States Irrigation Works* (Washington, D. C., 1917); Kammüller, *Die Theorie der Gewichtstaumauern* (Berlin, 1929). Most satisfactory, however, are the files of the *Engineering News-Record* (New York); *Reclamation Record* (Washington); *Engineering* (London); and *En-*

*gineer* (London), and *Transactions of the American Society of Civil Engineers* (New York, current), as well as *Reports, Chief of Engineers U. S. Army* (Washington, annual); and *Reports, Commissioner of the Reclamation Bureau* (Washington, annual). See WATER POWER; WATER SUPPLY.

**DANA, CHARLES LOOMIS** (1852- ). An American neurologist (see Vol. VI). He became professor of nervous diseases at the newly founded Cornell University Medical School, New York City, in 1902. In 1914-16 he was president of the New York Academy of Medicine. His *Textbook of Nervous Diseases* reached 10 editions by 1929. He also wrote *Peaks of Medical History*.

**DANA, JOHN COTTON** (1856-1929). An American librarian (see Vol. VI). He continued as head of the Newark, N. J., Free Public Library and director of the Newark Museum Association until his death, publishing *The Industrialist as an Artist* (1927); *Art is All in Your Eye* (1927); *Should Museums be Useful?* (1927); *Changes in Library Methods in a Changing World* (1927), and numerous other pamphlets and monographs.

**DANA, PAUL** (1852- ). An American editor (see Vol. VI). He was stationed at Namur from May to June, 1915, as a member of the Committee for Relief in Belgium.

**DANDURAND, RAOUL** (1861- ). A Canadian lawyer and statesman (see Vol. VI). He became minister without portfolio in Canada in 1921 and was president of the Sixth Assembly of the League of Nations. Mrs. Dandurand, his wife, was elected vice president of the National Council of Women, and was decorated by the French government for her literary attainments.

**DANDY, WALTER E.** (1866- ). An American surgeon, born at Sedalia, Mo. He graduated in arts at the University of Missouri in 1907 and in medicine at Johns Hopkins in 1910, later joining the Johns Hopkins faculty. In 1921 he was made associate professor of surgery, specializing in brain and spinal cord work along the lines inaugurated by Professor Harvey Cushing (q.v.). He contributed many important papers on the causes and mechanism, diagnosis, and surgical treatment of brain tumors, brain abscess, internal hydrocephalus, convulsions, etc., and introduced pneumography into routine use in the diagnosis of brain tumors.

**DANE, CLEMENCE (WINIFRED ASHTON)** (?- ). An English author, who wrote the following novels: *Regiment of Women*; *First the Blade*; *Legend* (1919), a novel composed chiefly of conversation which gives a striking revelation of character through its subtlety of method; *Wandering Stars* (1924); *The Dearly Beloved of Benjamin Cobb* (1927); and *The Babyons* (in four parts, 1928). She was an actress for four or five years and also wrote the following dramas: *A Bill of Divorcement* (1921); *Will Shakespeare* (1922); *The Way Things Happen* (1924); *Naboth's Vineyard* (1925); and *Mariners* (1927).

**DANIELS, JOSEPHUS** (1862- ). An American public official (see Vol. VI). He was Secretary of the Navy under President Wilson from 1913 to 1921, and from the beginning urged the establishment of a larger Navy. He believed in government ownership of armorplate factories, and of telephones and telegraphs. In 1921 he resumed the editorship of the *Raleigh News and*

*Observer*. He wrote *The Navy and the Nation* (1919); *Our Navy at War* (1922); and *Life of Woodrow Wilson* (1924).

**D'ANNUNZIO.** See ANNUNZIO; ITALIAN LITERATURE; ITALY, under *History*.

**DANUBE RIVER.** See WORLD WAR.

**DANZIG.** Formerly belonging to Germany, but since 1920 a Free City established by the Treaty of Versailles and placed under the League of Nations' protection. The area of the district is about 754 miles and the population, on Aug. 31, 1924, 384,000, largely German; in fact, only 6 per cent were Poles. The Free City area contains 318 localities, four of them cities with the following populations in 1927: Danzig proper, 230,000; Zoppot, 27,500; Neuteich, 2860; Tiegenhof, 3100. Of the Free City's total boundary line of 147 miles, 35 miles are on the sea. The production of the rural sections falls short of the requirements of the population with the result that foodstuffs have to be imported. The same is true of lumber, and stocks have to be imported from Poland. With Poland, Danzig is connected by three main lines, Danzig to Warsaw, 204 miles; Danzig to Lodz, 263 miles; Danzig to Posen, 192 miles. Inland waterways communication is maintained by the Vistula. Although by 1922 Danzig's trade had not reached pre-war proportions, it seemed in a fair way to recover its old stability. In 1913, 1921, and 1925 imports into Danzig by sea weighed, in metric tons, 1,233,630, 1,322,428, and 690,779; and exports by sea, 878,471, 383,448, and 2,031,969. A resumption of the importation of hides and skins, wool, wine, etc., all of which were destined for reshipment, appeared in 1922. Before the War, the principal exports from Danzig were grain, lumber, and sugar. Lumber has recovered pre-war proportions; sugar, too, was rapidly increasing, but grain had become an article of import. In 1926 the exports were as follows: Lumber, 1,391,000 tons (in 1927, 1,700,000 tons); grain, 272,000; sugar, 185,000; and coal, 3,405,000. Total goods imported in 1927 amounted to 1,517,194 tons and goods exported to 6,380,419 tons. In 1913, 2854 vessels of 918,097 net tons entered, and 2836 vessels of 931,509 net tons cleared, Danzig; in 1926, 5967 vessels of 3,432,480 net tons entered and 5963 vessels of 3,395,840 net tons cleared. The Free City of Danzig is not a port where no customs duties are levied but is included in the Polish Customs Union with duties levied according to the Polish tariff schedule. One basin only is set aside as a "free port" where goods may be imported without duty and stored, transhipped or reexported later. With modern facilities Danzig in 1928 ranked third among the Baltic ports.

**History.** The problem posed in 1919 by the Polish claim to a sea outlet involved several important considerations. Danzig, the focal point of Polish aspirations, was overwhelmingly German in population, at least 90 per cent. The creation of a Polish "corridor" through Prussia to connect Poland with Danzig on the sea meant the separation from the Reich of some 2,000,000 Germans in East Prussia. On the other hand, Danzig was bound up with the life of the new state economically and geographically, for Danzig was the port of the Vistula, and the valley of the Vistula was really Poland. But to preserve the principle of self-determination, of which so much had been made during the

War, and to check the growth of a German irredentism, a compromise had to be effected. Articles 100-108 of the Treaty of Versailles, therefore, set up in Danzig and the German area about it a Free City under the League of Nations. Its governing head was to be a High Commissioner; foreign relations and customs tariff were to be controlled by Poland; while economic matters such as administration of railways, posts, telegraph lines, waterways, and port facilities, were to be largely in Polish hands. Under Article 103 of the Versailles Treaty, which provided for the drafting of a constitution by representatives of the city in agreement with the High Commissioner appointed by the League, a Constituent Assembly was elected in Danzig on May 16, 1920, by universal suffrage with proportional representation. This Assembly, in which the various German parties had an overwhelming majority, drew up a constitution which was approved by the High Commissioner and the League. The formal proclamation of the new state, in accordance with these arrangements, occurred on Nov. 15, 1920. The essential points of the new system thus created were that the High Commissioner was to decide all points of dispute between Danzig and Poland, though a right of appeal to the League Council was assured; local autonomy was preserved through the creation of a bicameral diet, the president of whose upper house was to act as state head; a single customs area was to exist, and Poland was to be in charge of railway, postal, telegraph, telephone, diplomatic, and consular matters; Danzig port and terminal questions were to be in the hands of a joint board headed by a neutral. The High Commissioner in 1928 was Dr. von Hamel who assumed his duties in February, 1926. See POLAND, under *History*.

**DARDANELLES AND BOSPORUS STRAITS.** To the completed Treaty of Lausanne of July, 1923, was appended an elaborate convention for the regulation of the Dardanelles and Bosphorus Straits in peace and war. A commission was set up under the protection of the League of Nations, presided over by a Turk with powers to execute the prescribed regulations for the passage of ships. A demilitarized zone was mapped out, to include much smaller areas along the shores of the Dardanelles Strait and the Strait of Bosphorus. The Turks were permitted to maintain a garrison at Constantinople and the free movement of their fleet in Turkish waters was not to be impaired. In time of peace, the Straits were to be free for all merchant vessels and for warships; in time of war, Turkey, if a belligerent, was permitted to exclude enemy merchantmen and warships.

**DARLING, JAY NORWOOD** (J. N. DRNG) (1876- ). An American cartoonist. He was born at Norwood, Mich., and studied at Yankton College, S. D., and Beloit College, receiving his bachelor's degree at the latter institution. After serving as a reporter on Sioux City (Iowa) newspapers, he became cartoonist for the *Journal* (1901-06). Later he held a like position on the *Des Moines Register* (1906-11), the *New York Globe* (1911-13), the *Des Moines Register* again (1913-17), and the *New York Herald Tribune* and *Des Moines Register* after 1917. He also contributed cartoons to *Collier's Weekly* and the *Country Gentleman*. His syndicated cartoons reached an estimated total of 5,000,000 newspaper readers daily. His earlier

tendency to crowd the scenes of his cartoons with detail was modified as his technique matured. A striking characteristic was his ability to create the semblance of rapid motion, as shown in the whirlwind effects of which he made frequent use. His handling of difficult political situations was praised by many as wise and courageous.

**DARLING, SAMUEL TAYLOR** (1872- ). An American physician, parasitologist, and authority on tropical medicine, born in Harrison, N. J. He obtained his medical degree at the College of Physicians and Surgeons at Baltimore in 1903 and he was in charge of the laboratory of the Panama Canal during the construction period (1906-14), later accompanying General Gorgas to South Africa. He became a member of the staff of the Rockefeller Foundation in 1915 and was chairman of the expedition to the Far East for the purpose of studying hookworm and malaria; later, he visited Brazil in a similar capacity. He wrote many papers on tropical diseases and animal parasites and published, in collaboration: *Hookworm and Malaria Research in Malaya, Java, and the Fiji Islands* (Darling, Barber, and Hacker, 1917), and *Studies in Hookworm Infection in Brazil* (Darling and Smillie, 1921).

**DARLINGTON, JAMES HENRY** (1856- ). An American Protestant Episcopal bishop (see VOL. VI). He declined an appointment on the United States Commission to Russia, but became head of the Serbian Relief Fund in the United States. In 1920, he was chairman of the commission sent by the Protestant Episcopal Church to confer with the Eastern Orthodox Churches and the Old Catholics, which visited Constantinople, Athens, and other European capitals for the purpose of making a concordat. He is the author of *Verses by the Way* (3d series, 1927).

**DARLINGTON, URBAN VALENTINE W.** (1870- ). A bishop of the Methodist Episcopal Church, South, born in Shelby Co., Ky., and educated at the Kentucky Wesleyan College. In 1890, he was ordained and from that time until 1917 was pastor in various churches in Kentucky and West Virginia. In 1917-18, he was president of the Morris Harvey College in Barboursville, W. Va. He was made a bishop in 1918.

**DARMSTAEDTER, därm-stä'tër, PAUL** (1873- ). A German historian, born in Berlin. He studied at the universities of Berlin, Munich, Freiburg, and Strassburg, and became professor in Göttingen in 1907. His works include *Das Reichsgut in der Lombardei und in Piemont* (1896), *Die Befreiung der Leib eigenen in Savoyen, Schweiz und Lothringen* (1897), and a history of the United States for Ullstein's *History of the World*. A recent publication was *Geschichte der Aufteilung und Kolonisation Afrikas* (1913-20).

**DARRACH, WILLIAM** (1876- ). An American surgeon, dean of the College of Physicians and Surgeons, Columbia University. He was born at Germantown, Pa., was graduated at Yale (A.B.) in 1897, and received the degree of M.D. at Columbia in 1901, taking the First Harsen Prize. After 1903 he taught anatomy and surgery at Columbia, becoming professor of clinical surgery in 1916, and dean of the medical faculty in 1919. He was attending surgeon at the Presbyterian Hospital, the Vanderbilt Clinic, the Roosevelt Hospital, and Bellevue Hospital. As a colonel of the Medical Corps, U. S. Army,

he took part in the Château-Thierry, St. Mihiel, and Meuse-Argonne campaigns in the World War. Dr. Darrach contributed articles on surgery, anatomy, and medical education to professional journals and was associate editor of the *Archives of Surgery*.

**D'ARSONVAL, ARSÈNE.** See ARSONVAL, ARSÈNE, D'.

**DARTMOUTH COLLEGE.** A non-sectarian institution for men at Hanover, N. H., for which an English royal charter was granted in 1769. With the exception of the War years, 1917-19, when the number of students registered in the college fell off sharply, Dartmouth has grown steadily from 1914. Between that time and 1928, the enrollment increased from 1329 to 2244; the faculty was increased from 123 to 261; and the library from 130,000 to 240,000 volumes. Among the numerous buildings constructed on the campus were Topliff Hall and Russell Sage Hall, dormitories; the Steele Chemistry Building; Robinson Hall, headquarters of other than athletic student organizations; the Fisher Ames Baker Memorial Library, the gift of George F. Baker of New York, costing \$1,000,000; a new varsity field house, the gift of Howard Clark Davis; a laboratory for the natural sciences; new golf links at Hilton Field; the Spalding Swimming Pool; and a concrete football stand, a memorial to the Dartmouth men who died in the War. During 1928 there were also under construction the Carpenter Art Building, the Sanborn English House, and two dormitories. In 1922 a new selective process for admission was adopted under which due weight was given to scholarship, character, qualities of leadership, and apparent ability to profit by college education, and special treatment was also provided later for students of high grade. Ernest Martin Hopkins, Litt.D., L.D., succeeded Ernest Fox Nichols as president in 1918.

**DARWINIAN THEORY.** See EVOLUTION; HEREDITY; ZOOLOGY.

**DASKAM, JOSEPHINE DODGE (MRS. SELDEN BACON)** (1876- ). An American author (see VOL. VI). Her recent works include: *To-Day's Daughter* (1914); *Open Market* (1915); *When Binks Came; The Memoirs of a Baby* (1920); *Blind Cupid* (1923), and new editions of many of her earlier publications. She is also the compiler of *On Our Hill* (1918); *Square Peggy* (1919); *Truth o' Women* (1923); *Medusa's Head* (1926); and *Counterpoint* (1927).

**DATO É TRADIER, dät'ò ä träd-yär', ENRIQUE** (1856-1921). A Spanish juriconsult and statesman (see VOL. VI). Upon the outbreak of the War, Dato was still in office and Spain's neutrality was a result of his efforts. He was Prime Minister during the crisis of 1917, and again in 1920-21. He was assassinated at Madrid on Mar. 8, 1921.

**DAUDET, dō'dä', ERNEST** (1837-1921). A French novelist and historian (see VOL. VI). His principal later works were *Les auteurs de la guerre de 1914*, Vol. I, *Bismarck*, Vol. II, *Guillaume II et François-Joseph* (1916); *Les complices des auteurs de la guerre* (1917); *La Mission du Comte de Saint-Vallier* (1918); *La Mission du Baron de Courcel* (1919); *Soixante années du règne des Romanoff* (1919); *L'avant-dernier Romanoff: Alexandre III* (1920); *Souvenirs de mon temps* (1st vol., 1921; others to be finished by his son).

**DAUDET, LÉON** (1867- ). A French novelist and editor, member of the Académie

Goncourt (see Vol. VI). His *Mémoires*, published from 1913 to 1922, were edited and translated by Arthur Kingsland Griggs (1925). His other later works include: *Hors du jong allemand* (1915); *Le Bonheur d'être riche* (1917); *Dans la lumière* (1919); *Le stupide XIXème siècle* (1921; tr. 1928); *Les Euxures devant les Hommes* (1922); *L'Hécatombe*, war memoirs (1923); *Moloch et Minerve* (1924); *Un jour d'orage*, a novel (1925); *La roman et les nouveaux écrivains* (1925); *L'agonie du régime*, 1919-25 (1925); *Le rêve éveillé* (1926); *Études et milieux littéraires* (1927); and *Courrier des pays-bas* (4 vols., 1928). During the World War, he was prominent in the campaign against defeatism and afterwards was conspicuous as head of the Action Française, the monarchist agitation. From 1919 until 1924, he was a member of the extreme right of the Chamber of Deputies. In 1927 his son was killed and Daudet implicated the police, which resulted in his arrest after a four-day siege in the office of *L'Action Française*. He caused an uproar by his escape from prison, and went first to Belgium and then to Holland.

**DAUGHERTY, HARRY MICAJAH** (1860- ). An American public official, born at Washington Court House, Ohio. He was educated in the public schools and studied law at the University of Michigan. He began practice at Washington Court House in 1881 and in 1893 removed to Columbus, Ohio, where he was in practice from 1902 to 1921. He was active in politics and was one of the leaders responsible for the nomination and election of President Harding, in whose cabinet he became Attorney General in 1921. Prior to that time, he had served in the Ohio House of Representatives for two terms. Following the death of President Harding in August, 1923, Mr. Daugherty was retained in office by President Coolidge. Throughout his term of service, he had been subject to severe criticism and this culminated in 1922 in an effort to bring impeachment proceedings in the House of Representatives. This failed on the ground that the evidence did not warrant the proceedings. In March, 1923, as a result of charges instigated chiefly by Senator Burton K. Wheeler of Montana, a committee of the Senate began an investigation into Mr. Daugherty's administration of his office. In spite of great pressure brought to bear upon him, President Coolidge refused to ask for Mr. Daugherty's resignation until the charges had been heard. Following Mr. Daugherty's refusal to furnish certain information to the committee, President Coolidge asked for and received his resignation on Mar. 28, 1924. In 1927 he was acquitted of conspiracy to defraud the Government.

**DAVENPORT, EUGENE** (1856- ). An American agriculturist (see Vol. VI). From 1895 to 1922, he was dean of the College of Agriculture at the University of Illinois, and in the latter year was made professor emeritus. Until 1922, he was director of the Agricultural Experiment Station and professor of thrematology at the University of Illinois. He wrote many agricultural bulletins for the experiment stations of Michigan and Illinois. He is also author of *Vacation on the Trail* (1923) and *The Farm* (1927).

**DAVENPORT, GEORGE WILLIAM** (1870- ). An American Protestant Episcopal bishop, born at Brandon, Vt. He studied at Ho-

bart College and was graduated from the General Theological Seminary in 1896, in which year he was also ordained. Subsequently, he was rector of various churches in the East, until he was consecrated bishop on Sept. 15, 1920. He has since resided at Easton, Md. While in Burlington, he served as provincial secretary of the first province.

**DAVID, KARL HEINRICH** (1884- ). A Swiss composer, born at St. Gall. He studied in Cologne and Munich, and then taught at the Basel Conservatory, 1910-14. The following three years he spent again in Germany, and then settled in Zurich, where, in 1927, he became editor of the *Schweizerische Musikzeitung*. He wrote *Das hohe Lied Salomonis* for soli, women's voices and orchestra; several female choruses with orchestra; a considerable quantity of chamber music; and the operas *Aschenputtel* (Basel, 1921), *Der Sizilianer* (Zurich, 1924), *Jugendfestspiel* (Zurich, 1924), and *Traumwandel* (Zurich, 1928).

**DAVIDSON, JO** (1883- ). An American sculptor born in New York City of Russian parents. He has won fame for his sculptures by the interpretation of the mental and physical in his subjects. His art is expressive of subdued emotion and characterized by massiveness of line. His original work won recognition in Paris, America, and London. He designed a heroic group for the French government to commemorate the first victory of the Marne and a statue of Senator Robert M. La Follette (q.v.) for the Capitol at Washington, D. C.

**DAVIDSON, THE MOST REV. AND RT. HON. RANDALL THOMAS, FIRST BARON OF LAMBETH** (1848- ). A former prelate of the Church of England (see Vol. VI), Archbishop of Canterbury from 1903 to 1928. Feeling himself too old to fill adequately so arduous a position, he resigned—an unprecedented action—at the age of 80, after 25 years as Primate of All England. His resignation, which took effect November 12, was signalized by the many honors bestowed upon him. He was given the freedom of the City of London and was made a baron so that he might still take part in the debates in the House of Lords. A gift of more than \$81,000 was raised by public subscription, \$10,000 of which came from his American admirers. As Primate, he was a strong force for the reconciliation of the factions within the church. He was decorated by Greece (1918), and Belgium and Serbia (1919). He wrote *The Testing of a Nation* (1919) and *Occasions* (1925).

**DAVIDSON COLLEGE.** An institution for the higher education of men at Davidson, N. C., founded in 1837. The student enrollment increased from 335 in 1914 to 625 in 1927-28, and in addition there was a summer school enrollment in 1928 of 90; the teaching staff increased from 15 to 45 in the autumn of 1928; the productive funds from \$284,745 to \$931,775, plus a 5 per cent equity in the Duke endowment; and the income increased from \$48,557 to \$311,102 in 1927-28, while the total plant valuation was placed at \$1,106,752 in 1928. The library contained 24,566 volumes in the latter year. During the period under review, three large fireproof dormitories, housing 340 students, were erected at a cost of \$225,000; and a central heating plant and homes for the professors were built; numerous courses were added to the curriculum; and entrance requirements were raised. President, W. J. Martin, M.D., Ph.D., LL.D.

**DAVIES, ARTHUR B.** (1862-1928). An American painter (see VOL. VI). In 1916 he was awarded the first W. A. Clark Prize and Corcoran gold medal. His manner continued highly individualistic, his rebellion against the existing order still softened by the romantic, mystic atmosphere with which he surrounded his subjects. In his later works, among them "Sea, Wind, and Sky," "Strewing Dust," "Orchard of Pleasant Bounties," and "Orestes," something of the mathematical or intellectual appeared to be displacing his earlier instinctive rhythm. By some, his feeling for abstract beauty was felt to be verging on preciosity. See *Arthur B. Davies: Essays on the Man and His Art*, by Duncan Phillips, Dwight Williams, Royal Cortissoz, Frank Jewett Mather, Jr., Edward W. Root, and Gustavus A. Eisen (1924).

**DAVIES, SIR (HENRY) WALFORD** (1869- ). A British organist and composer, born at Oswestry, England. He received his first musical education as a chorister in St. George's chapel, Windsor. From 1885 to 1890, he studied organ with Sir W. Parratt, acting frequently as his assistant. In 1890 he won a scholarship at the Royal College of Music, where for four years he studied composition, at the same time holding positions as organist. In 1895 he became professor of counterpoint at the Royal College of Music, remaining there till 1919, when he became professor of music at the University of Aberystwyth. He also was conductor of the London Church Choir Association (1901-13) and of the Bach Choir (1903-07). He was knighted in 1922. His works include an oratorio, *The Temple*; two symphonies; two overtures, *Dedication* and *Festal*; two suites for orchestra, *Parthenia* and *Wordsworth*; *Short Requiem, à cappella*; three piano quartets; two string quartets; three violin sonatas; a horn sonata; anthems, songs, and part-songs. He also published *Music and Christian Worship* (1913).

**DAVIES, SIR LOUIS HENRY** (1845-1924). A Canadian jurist (see VOL. VI). He remained a member of the Dominion House of Commons from 1882 to 1918, when he was appointed chief justice of the Supreme Court of Canada. In the same year, Chief Justice Davies became Deputy Governor General of Canada.

**DAVIES, WILLIAM HENRY** (1870- ). A Welsh poet and author, born at Newport, England. He began life as a picture-frame maker, but after completing his apprenticeship, he tramped through England and America, picking fruit, selling pins and needles, etc., and crossed the ocean several times on cattle boats. His published poems include *Collected Poems: Second Series* (1923), *Secrets* (1924), *A Poet's Alphabet* (1925); *The Song of Love* (1926); *A Poet's Calendar* (1927), and *Collected Poems* (1929). His prose works are *The Autobiography of a Super-Tramp* (1908), *Beggars* (1909), *A Weak Woman* (1911), *The True Traveler* (1912), *A Poet's Pilgrimage* (1918), *Later Days* (1925); *The Adventures of Johnny Walker, Tramp* (1926), and *Dancing Mad* (1927).

**DAVIS, BERGEN** (1869- ). An American physicist. He was born at White House, N. J., graduated at Rutgers College (B.S., 1896), received the Ph.D. degree at Columbia, and studied at Göttingen and Cambridge. He became instructor in physics at Columbia in 1903 and professor in 1918. Having contributed papers on sound ionization by collision, radiation by

electron impact, X-ray emission, etc., he was elected to the National Academy of Sciences in 1929.

**DAVIS, CHARLES HAROLD** (1856- ). An American painter (see VOL. VI). The change from his earlier tendency to interpret nature in her more sombre moods is to be seen in such later paintings as "The Sunny Hillside," "In Golden Light," and "On the West Wind," where hill and tree, as well as cloud, are used expressively and a spirit of light and joy predominates.

**DAVIS, DWIGHT FILLEY** (1879- ). An American public official and Governor General of the Philippines. He was born at St. Louis, Mo. After graduation at Harvard, he studied law at Washington University (LL.B., 1903) and at once became actively interested in the community life of his native city, serving on various municipal commissions and in city offices. In the World War, he was successively captain, major, and lieutenant colonel and was awarded the D.S.C. "for extraordinary heroism" in operations at Baulny and Chaudron Farm, France, on Sept. 29-30, 1917. He was appointed Director of the War Finance Corporation, 1921-23, Assistant Secretary of War, 1923-25, and Secretary of War, 1925-29. President Hoover named him as Governor General of the Philippines in May, 1929. In his inaugural address of July 8, 1929, he pledged his administration to friendly coöperation with the Filipino people, and the suppression of dishonesty in government.

**DAVIS, HARVEY NATHANIEL** (1881- ). An American physicist, born at Providence, R. I. He was graduated in 1901 at Brown University and received his Ph.D. at Harvard in 1906. He was instructor of physics at Harvard in 1905-10, and, after successive promotions, he became professor of mechanical engineering, 1919-27. Since 1928 he has been president of the Stevens Institute of Technology. He also served with the General Electric Company during 1917-18, in charge of their turbine department; and in 1921 became consulting engineer to the United States Bureau of Mines. During the World War, he was associated with the Air Service of the United States Army as a mechanical engineer. His various original investigations have had to do with the thermal properties of matter. He is the author (with L. S. Marks) of *Steam Tables and Diagrams* (1908) and (with N. H. Black) of *Practical Physics for High Schools* (1913).

**DAVIS, HENRY WILLIAM CARLESS** (1874-1928). An English historian (see VOL. VI). In 1915 he was a member of the War Trade Intelligence Department, and the following year of the War Trade Advisory Committee. He was made Commander in the Order of the British Empire in 1918 and became director of the *Dictionary of National Biography* (1920), and was professor of modern history in the University of Manchester (1921-25). In 1924 he was Fords Lecturer at Oxford University. From 1925 until his death, he was Regius Professor of modern history at Oxford, and in 1926 he was made curator of the Bodleian Library. His works include: *Political Thought of Treitschke* (1914); *Why We Are at War* (in collaboration, 1914); contributions to the *History of the Peace Conference* (ed. Temperley, 1920, etc.); "England, 1815-46," in *Story of the British Nation* (1923); and *Medieval England* (1924). He edited *Oxford Pamphlets* (1914-15).

**DAVIS, JAMES COX** (1867- ). An American lawyer, born at Keokuk, Iowa. After passing through the public schools at Keokuk and London, Ont., he was admitted to the bar in 1877 and began practice in Keokuk, where he remained until 1903. He acted as city solicitor of Keokuk, and as mayor. Under the Federal administration of railways, he was general solicitor for the Chicago and Northwestern, and in 1920-21 he was general counsel of the United States Railroad Administration. In the latter year, he was appointed director general and agent of the President in settling controversies arising out of Federal control. He resigned that post in 1926 and resumed private practice at Des Moines, Iowa.

**DAVIS, JAMES JOHN** (1873- ). An American cabinet member, born at Tredegar, South Wales, where he attended the public schools. He came to the United States in 1881 and later worked in iron and steel mills in Pittsburgh and in Elwood, Ind. From 1898 on, he was active in city and State politics in Indiana and in various fraternal organizations. He was a founder of the Mooseheart (Ill.) Home and School. He was named Secretary of Labor in 1921 by President Harding and continued under Presidents Coolidge and Hoover.

**DAVIS, JOHN WILLIAM** (1873- ). An American lawyer and diplomatist, born at Clarksburg, W. Va., and educated at Washington and Lee University. He was admitted to the bar in 1895, and from 1896 to 1897 was assistant professor of law in Washington and Lee University. During the period 1897-1913, he practiced law at Clarksburg, took an active interest in State and national politics, and was elected to Congress. From 1913 to 1918, he was Solicitor General of the United States, and from the latter year until 1921, he was Ambassador to Great Britain. In 1924 he was Democratic nominee for the Presidency. In 1921 he resumed the practice of law in New York City. He is president of the English-Speaking Union for the United States. See UNITED STATES, under *History*.

**DAVIS, KATHERINE BEMENT** (1860- ). An American sociologist (see VOL. VI). She was appointed, by Mayor Mitchell, Commissioner of Correction of New York City, for the term Jan. 1, 1914, to Dec. 28, 1915. From 1915 to 1917, she was chairman of the Parole Commission. In 1918 she was director of the women's work section of the Social Hygiene Division of the Commission on Training Camp Activities, and in the same year, was appointed general secretary of the Bureau of Social Hygiene. She directed a study of the housing conditions of employed women in the Borough of Manhattan, New York City, the results of which were published in 1922.

**DAVIS, NORMAN H.** (1878- ). An American statesman, born in Bedford Co., Tenn., and educated at Vanderbilt University and the University of California. In 1902 he interested himself in the sugar, banking, and other businesses in Cuba. During the World War, he was active on various commissions and boards and as special delegate to foreign countries, particularly as regards financial problems. He was financial adviser to the American Peace Delegates in Paris and a member of the Armistice Commission and of the Supreme Economic Council. In 1919-20 he was Assistant Secretary of the Treasury, and from 1920 to 1921, he

was alternately Under Secretary of State and Acting Secretary of State. In May, 1927, he served as a member of the American delegation to the International Economic Conference at Geneva.

**DAVIS, OWEN** (1874- ). An American dramatist born in Portland, Me., who began writing plays in 1898 and has written more than 100 plays produced in New York. Of these, about 50, mostly melodramas, were produced by A. H. Woods. His most recent popular plays were: *The Family Cupboard*; *Sinners*; *Mile a Minute*; *Forever After*; *Opportunity*; *The Detour* (1921); *Icubound* (1922), which was awarded the Pulitzer Prize for the year; *The Nervous Wreck* (1923); *Lazzybones* (1924); *Easy Come, Easy Go* (1925); *Beware of Widows* (1925).

**DAVISON, FREDERICK TRUBEE** (1896- ). An American Assistant Secretary of War, who was born in New York City, graduated at Yale, and who studied law at Columbia (LL.B., 1922). In the World War, he served in the Naval Air Service. He was admitted to the bar in 1922 and began practice in New York City. He represented Nassau County in the State Assembly in 1922-26. In 1926 President Coolidge appointed him Assistant Secretary of War and President Hoover, three years later, reappointed him to the same office. He has had special oversight of the development of the army aviation service. He was a trustee of the Guggenheim Fund for the Promotion of Aviation, and a member of the executive committee of the National Crime Commission.

**DAVISON, HENRY POMEROY** (1867-1922). An American banker born at Troy, Pa. After attending school at Greylock Institute, South Williamstown, Mass., he was errand boy in a bank conducted by his uncle at Troy, Pa. He later went to the Astor Place Bank, New York City, remaining there from 1891 to 1894. He became vice president of the First National Bank in 1902 and afterwards a member of the firm of J. P. Morgan & Co. He was chairman of the executive commission and a director of the Bankers' Trust Company; director of the American Foreign Securities Company; and from 1917 to 1919, he was chairman of the War Council of the American Red Cross, during the time when \$300,000,000 was raised by popular subscription for war sufferers. He was elected chairman of the governing board of the World League of Red Cross Societies in Paris, May, 1919.

**DAVISSON, CLINTON JOSEPH** (1881- ). An American physicist. He was born at Bloomington, Ill., and graduated (B.S.) at the University of Chicago in 1908. He obtained the Ph.D. degree at Princeton in 1911. For six years, he was instructor in physics at the Carnegie Institute of Technology, Pittsburgh, and since 1917 has been a member of the technical staff of the Bell Telephone Laboratories in New York City. In 1928 he was awarded the Comstock Prize (\$2300) for the discovery of electron diffraction. In the following year, he was elected to the National Academy of Sciences. He is the author of many papers on radiation, thermionics, and electron physics.

**DAWES, CHARLES GATES** (1865- ). An American public official (see VOL. VI). In 1917 he was in France on General Pershing's administrative staff. He was chairman of the general purchasing board and also general purchasing agent for the United States Army in

France. In 1919 he returned to the United States, and in 1921 was appointed by the President as director of the newly created Bureau of the Budget, and organized the first budget of the United States government. On July 8, 1922, he retired from the Budget Bureau, and in November of the same year was elected director of the Chicago & Great Western Railway Company. In 1923 General Dawes was appointed chairman of an international group of experts to ascertain Germany's capacity to pay war reparations which formulated the Dawes Plan, put into operation Sept. 1, 1924. (see REPARATIONS). Nominated for Vice President of the United States by the Republican Party in June, 1924, he was elected in November. In his inaugural address, he vigorously attacked the rules of the Senate permitting unlimited debate and advocated their modification throughout his term of office, but without success. In 1925 he was awarded the Nobel Peace Prize jointly with Sir Austen Chamberlain, British Foreign Secretary. He turned over his share of the prize to the endowment fund of the Walter Hines Page School of International Relations at Johns Hopkins. At the expiration of his term as Vice President in March, 1929, he headed a commission of American financial experts who reorganized the finances of the Dominican Republic. While engaged in this task, he was appointed Ambassador to Great Britain to succeed Alanson B. Houghton. Immediately after assuming his duties as Ambassador in June, 1929, he outlined President Hoover's proposals for limitation of naval armaments to Prime Minister Ramsay MacDonald in Scotland (Sunday, June 16), and on June 18, speaking before The Pilgrims in London, he indicated the procedure which the United States Government would follow in its attempt to secure world naval limitation. Through the Summer he was in active conference with the Prime Minister on this subject. He received an honorary D.C.L. degree from Oxford, 1929. He wrote *A Journal of the Great War* (1921) and *The First Year of the Budget of the United States* (1923).

**DAWES REPORT.** See REPARATIONS.

**DAWSON, ALEC JOHN** (1872- ). An English novelist (see VOL. VI). He served throughout the World War (1914-19), was awarded the Croix de Guerre with Palm, and decorated with the Order of the British Empire. In 1919-21, he was director of information to the Government of Bombay. He is author of *How to Help Lord Kitchener* (1914); *Somme Battle Stories* (1916); *Back to Blighty* (1917); *For France* (1917); *Everybody's Dog Book* (1922); *Britain's Life Boats* (1923); *Peter of Monks-leaze: His Mortal Tenement* (1924); *The Emergency of Marie* (1926); and *Letters to Young Dog Owners* (1927).

**DAWSON, CONINGSBY (WILLIAM)** (1883- ). An Anglo-American author (see VOL. VI). He joined the Canadian Army at the front in 1916 and continued in service until the end of the World War. After having been wounded, he came twice to the United States (1917, 1918) on lecture tours. In 1918 he investigated, for the British Ministry of Information, American military preparedness in France. In 1919 he went to England to study European reconstruction problems, and subsequently lectured on the subject of the United States. He also visited and reported on the devastated regions of central and eastern Eu-

rope at the request of Herbert Hoover. His recent works include: *Florence on a Certain Night* (1914); *The Raft* (1914); *Slaves of Freedom* (1916); *The Seventh Christmas* (1917, 1921); *Carry On* (1917); *The Glory of the Trenches* (1918); *Out To Win* (1918); *Living Bayonets* (1919); *The Test of Scarlet* (1919); *The Little House* (1920); *It Might Have Happened to You* (1921); *The Kingdom Round the Corner* (1921, 1923); *Christmas Outside Eden* (1922); *The Coast of Folly* (1924); *Old Youth* (1925). He also edited, with W. J. Dawson (q.v.), *Best Short Stories* (1923).

**DAWSON, MILES MENANDER** (1863- ). An American lawyer (see VOL. VI). He was adviser to the Governor of New York and the commission regarding workmen's compensation in 1914. He was special counsel for the United States in the tax litigation in 1915 and 1917. In 1917 and 1921 he was adviser to the War Risk Bureau, and in 1918-19, special attorney examiner for the United States Shipping Board Emergency Fleet Corporation. In the latter year, he was also counsel and actuary for the commission to investigate the New York State Insurance Fund. He is the author of *The Ethics of Confucius* (1915) and *Ethics of Socrates* (1924) and the translator of *Brand*, a poetical tragedy, by Henrik Ibsen (1916).

**DAWSON, THE REV. WILLIAM JAMES** (1854-1928). An English clergyman and author (see VOL. VI), who settled in the United States and was a Presbyterian pastor in Newark, N. J. He was the author of: *Robert Shenstone* (novel, 1917); *The Father of a Soldier* (1917); *The War Eagle* (1918); *Chalmers Comes Back* (1919); *The Borrowdale Tragedy* (1920); and *The Autobiography of a Mind* (1925). He edited, with Coningsby Dawson (q.v.), *Best Short Stories* (1923).

**DAWSON OF PENN, BERTRAND, FIRST BARON** (186- ). A British medical authority, Physician-in-Ordinary to King George V since 1907 and to the Prince of Wales since 1923. Receiving his medical training at University College and London Hospital, he became physician to the hospital and physician-extraordinary to King Edward VII. He was created baron in 1920, a Knight Commander of the Bath in 1926, and a Privy Councillor in 1929, following King George's recovery from his severe illness of the winter of 1928-29. He holds honorary degrees from leading British and American universities. His long list of medical works includes *The Diagnosis and Operative Treatment of Diseases of the Stomach* (1908); *The Microbic Factor in Gastro-Intestinal Disease* (1911); and *Paratyphoid Fever* (1916).

**DAY, CLIVE** (1871- ). An American university professor (see VOL. VI). He was chief of the Balkan Division of the American Commission to Negotiate Peace (Paris, 1918-19). He published a revised and enlarged edition of his *History of Commerce* (1922); *The Question of the Balkans*, a brochure (1920), and *History of Commerce of the United States* (1925).

**DAY, FRANK PARKER** (1881- ). An American college president. He was born at Shubenacadie, Nova Scotia, and graduated at Mount Allison University, Sackville, N. B. (1903). He later studied at Oxford (Rhodes Scholar) and the University of Berlin (1905-09), and was a lecturer at the University of Bristol, Eng. (1908-09). Returning to America, he held professorships of English at the Uni-

versity of New Brunswick (1909-12) and the Carnegie Institute of Technology at Pittsburgh (1912-14). In the World War, he recruited and commanded the 185th Cape Breton Highlanders, served in France with the 16th Royal Scots, and commanded the 25th Canadian Infantry Battalion. After the Armistice, he returned to the Carnegie Institute of Technology as dean (1919-27). He was professor of English at Swarthmore College (1927-29) and was installed as president of Union College, Schenectady, N. Y., in 1929. He is the author of *River of Strangers*; *The Autobiography of a Fisherman*; and *Rock-bound*; besides short stories contributed to magazines.

**DAY, HOLMAN FRANCIS** (1865- ). An American author (see VOL. VI). Among his later works are *The Landloper* (1915); *Along Came Ruth* (play produced in New York, 1914); *Blow the Man Down* (1916); *Where Your Treasure Is* (1917); *Kavanagh's Clare* (1917); *The Rider of the King Log* (1919); *When Egypt Went Broke* (1920); *All Wool Morrison* (1921); *Joan of Arc of the North Woods* (1922); *The Loving Are the Daring* (1923); *Clothes Make the Pirate* (1925); *John Lang* (1926); *Star-wagons* (1928).

**DAY, JAMES ROSCOE** (1845-1923). An American educator (see VOL. VI). In 1922 he became chancellor emeritus of Syracuse University. He was famous as a defender of "big business." During and after the World War, he criticized the Wilson administration and the League of Nations unsparingly. He published *My Neighbor the Workingman*, and at the time of his death was about to start on an autobiography.

**DAYTON.** A city of Ohio. The population increased from 116,577 in 1910 to 152,559 in 1920, and to 184,500 in 1928 by estimate of the Bureau of the Census. The population of Greater Dayton is estimated at 220,000. The corporate limits of Dayton cover an area of 17 square miles, while the suburbs which surround the city extend this area to 40 square miles. Dayton operates under the city manager form of government, being the first large city in the United States to adopt this plan (1914). The Miami Valley, which gives to Dayton much of its scenic beauty, also brought to it the devastating flood in 1913. The Miami River overflowed its banks, inundating the downtown section, but Dayton citizens turned this calamity into an opportunity to reestablish and rebuild the city on a bigger scale and also build a series of dams which would prevent the occurrence of another flood. These dams, when completed in 1923, cost \$32,000,000 and are considered one of the world's greatest engineering projects.

Dayton is known internationally as the home of aviation. Here the first heavier-than-air flying machine was invented and the city has remained an important aviation centre. It presented to the United States Government 5000 acres of land which is now the permanent home of governmental research and engineering laboratories. The aviation field is named in honor of Wilbur and Orville Wright.

Dayton is essentially an industrial city, its industries manufacturing more than 1000 different articles. The 50,000 employees in 510 manufacturing establishments are paid \$63,500,000 a year. The value of goods manufactured and sold each year is placed at \$327,000,000. There are eight banking institutions and 18

building and loan associations, the assets of which exceed \$125,000,000. The building and loan system is said to be the largest in the United States, both in the number of institutions and amount of assets. The assessed valuation of real property in Dayton, in 1928, was \$347,277,780, the tax rate being \$25 per \$1000; and the net debt was \$19,443,126.

Dayton is also an educational centre. It has 32 public schools, 17 parochial schools, two seminaries and one university. Bonebrake Seminary is conducted by the United Brethren Church, and students of this denomination from every part of the country receive their theological education here. Central Theological Seminary is maintained by the Reformed Church. It is a denominational college preparing students for the ministry. The University of Dayton, a Roman Catholic institution, has an annual enrollment of 1200 students. The buildings and grounds are valued at \$2,350,000. Its courses are open to persons of any religious faith who desire education in commerce and law, engineering, arts and letters, and natural science.

**DEALEY, JAMES QUAYLE** (1861- ). An American university professor (see VOL. VI). He was president of the American Sociological Association in 1920, and in 1921 went to China as exchange professor and lecturer. In 1928 he became professor emeritus at Brown University and joined the staff of the Dallas, Tex., *News*. He wrote *The Growth of State Constitutions* (1915); *Sociology—Its Development and Applications* (1920); *State and Government* (1921); *Foreign Policies of the United States* (1927); and *Political Situations in Rhode Island* (1928).

**DEAN, ARTHUR LYMAN** (1878- ). An American chemist and university president, born at Southwick, Mass. He was graduated at Harvard in 1900 and received his Ph.D. from Yale in 1902. During 1902-07, he taught plant physiology at Sheffield Scientific School, Yale, and was also a Carnegie research assistant during 1904-05, as well as chief of the section of wood chemistry in the United States Forest Service during 1905-07. He had charge of the chemical laboratory of A. D. Little in Boston during 1907-08, but at the close of the year returned to the Sheffield Scientific School, being assistant professor until 1914. That year he was called to the presidency of the University of Hawaii in Honolulu, where he remained until 1927. His original investigations have included studies on inulin, proteolytic enzymes, creosote oils, and chaulmoogra oil in treatment of leprosy, on all of which he has published valuable papers.

**DEAN, BASHFORD** (1867-1928). An American zoölogist and expert in armor (see VOL. VI). Dr. Dean's active professorship of vertebrate zoölogy at Columbia terminated in 1927. In 1926 he retired as curator of ichthyology at the American Museum of Natural History, but retained an honorary curatorship. From 1903 until his death, he was curator of arms and armor at the Metropolitan Museum of Art, New York City. He also was adviser on armor to the U. S. War Department. In addition to many works on fishes (including a bibliography of 50,000 titles), he was the author of several publications on arms and armor.

**DEARBORN, GEORGE VAN NESS** (1869- ). An American psychologist and surgeon, born at Nashua, N. H. He was educated at Dartmouth College and the College of Physicians

and Surgeons, Columbia University (M.D., 1893). After graduate study in psychology at Harvard and Columbia (Ph.D., 1899), he became a professor of psychology and education at the Sargent Normal School, Cambridge, Mass. (1906-21) and professor of physiology at Tufts College (1900-16). During and since the World War, he has been attached to the U. S. Public Health Service, neuropsychiatric division. Besides various contributions to professional journals, he wrote *The Emotion of Joy* (1899); *Textbook of Human Physiology* (1908); *Motor-Sensory Development* (1910); *Physiology and Hygiene* (1921); and other works on psychology and hygiene.

**DEARBORN, WALTER FENNO** (1878- ). An American psychologist and educator born at Marblehead, Mass. He was educated at Wesleyan and Columbia universities, receiving his degree of Ph.D. from the latter institution in 1905. He pursued medical studies in German at the University of Munich, taught educational psychology at the University of Wisconsin, and in 1909-12 was associate professor of education at the University of Chicago. He was assistant professor, 1912-17, and professor since 1917 at Harvard. One of the leading authorities in educational psychology, Professor Dearborn has contributed numerous papers on the psychology of reading, the practice experiment in learning, intelligence tests, mental hygiene, and school training. He is the author of *Dearborn Group Tests of Intelligence* (1920).

**DEATH.** See ZOOLOGY.

**DEAVER, JOHN BLAIR** (1855- ). An American surgeon, who received his medical degree from the University of Pennsylvania in 1878, and was appointed Barton professor of surgery there and chief surgeon to the University Hospital. He became professor emeritus in 1923. His major publications include: *Treatise on Appendicitis* (1896), which was expanded in its fourth edition (1913); *Surgical Anatomy*, 3 vols. (1889-93); *Enlargement of the Prostate* (1905); *Surgery of the Upper Abdomen*, in collaboration with Ashhurst, 2 vols. (1909, 1913); *Surgical Anatomy of the Head and Neck* (1912); *The Breast*, in collaboration with McFarland (1917); *Excursions into Surgical Subjects*, with Reimann (1923). In 1926-7 appeared a new edition of his anatomical work with the title *Surgical Anatomy of the Human Body*, 3 vols.

**DE BLOIS, AUSTEN KENNEDY** (1866- ). An American clergyman, born at Wolfville, N. S., educated at Brown University, and in Berlin and Leipzig, Germany. He became president of Shurtleff College, Alton, Ill., in 1894. During 1900-01, he traveled in Europe and Africa, and on returning to the United States became pastor of several Baptist churches successively including the First Baptist Church of Boston, 1911-26. He edited the *Watchman-Examiner*, New York, 1926-28, and was president of the Eastern Theological Seminary, 1926-. He wrote: *Bible Study in American Colleges* (1899); *The Pioneer School* (1900); *Imperialism and Democracy* (1901); *History of the First Baptist Church in Boston, 1665-1915* (1916); *Life of John Mason Peck, Prophet of the Prairies* (1917); *The Message of Wisdom: Studies in the Book of Proverbs* (1920).

**DEBS, EUGENE VICTOR** (1855-1926). An American Socialist leader and labor organizer (see VOL. VI). He was convicted of violation of the espionage act in September, 1918, and was

sentenced to 10 years' imprisonment. The decision was sustained by the Supreme Court of the United States on Mar. 10, 1919, and he went to prison on Apr. 13, 1919. He was pardoned by President Harding on Dec. 24, 1921, but his political rights were not restored. In 1925 he campaigned in New York City for the Socialist Mayoralty candidate. His health was broken by his labors on behalf of political prisoners. He died in a sanitarium at Elmhurst, Ill.

**DEBT, PUBLIC.** See FINANCE AND BANKING.

**DEEPING, (GEORGE) WARWICK** (1877- ). A British author born in Southend, Essex, and educated at Merchant Taylors' School and Trinity College, Cambridge. He became a doctor, but after practicing a year, turned to literature. In 1915 he joined the Royal Army Medical Corps and served in Gallipoli, Egypt, and France. The appealing and human qualities of his characters made his novels popular. They include *Uther and Igraine*; *A Woman's War* (1907); *The Rust of Rome*; *The Return of the Petticoat*; *Unrest* (1916); *Martin Valliant* (1917); *Second Youth* (1919); *The House of Adventure* (1921); *The Secret Sanctuary* (1923); *Sula John* (1924); *Sorrell and Son*, the novel that made his reputation (1925); *Doomsday* (1927); *Kitty* (1928); *Old Pybus* (1928); and *Ropers Row* (1929).

**DEFLATION.** See AGRICULTURE; FINANCE AND BANKING.

**DE FOREST, LEE** (1873- ). An American inventor (see VOL. VI). In 1915 he was awarded a gold medal by the San Francisco Exposition for his work in developing the radio telephone. In 1919 he had taken out over 120 patents on radio devices, the most important being the "Audion," a detector, oscillator, and amplifier which made possible telephone service both by wire and wireless across the continent. Several of his most important patents were sustained by the courts.

**DE HAVEN, FRANK** (1856- ). An American painter, born at Bluffton, Ind. He was a pupil of George H. Smilie. Having specialized in landscapes, he won the Innes and Shaw prizes of the Salmagundi Club (New York) in 1900 and 1901, silver medals at the Charleston and St. Louis Expositions, and the Vezin Prize (1916), and the Plimpton Prize (1925) of the Salmagundi Club. In 1920 he was elected a member of the National Academy of Design.

**DEISSMANN, dis'män, GUSTAV ADOLF** (1866- ). A German New Testament scholar, professor at the University of Berlin, *Geheimkonsistorialrat* (1916- ), member of the Brandenburg Provincial Synod and of the Prussian General Synod from 1914 on (see VOL. VI). He delivered a course of lectures for the clergymen in 1916-17 in Warsaw, Vilna, and Brussels. In 1918 he was for the second time Olaus-Petri Lecturer at the University of Upsala, and the following year became a member of the German Evangelical Synod in Dresden. His works published since 1913 include: *Der Lehrstoff für Religionsgeschichte* (1914); *Der Krieg und die Religion* (1914); *Deutscher Schwertsegen* (1915, 28th ed., 1916); *Inneres Aufgebot* (1st to 3d ed., 1915); *Evangelischer Wochenbrief* (1914-21); *The Religion of Jesus and the Faith of Paul* (English ed., 1923); *De Profundis* (1925), and *Die Regierungswissenschaft in Selbstdarstellungen* (1925).

**DELACHENAL, de-lä-shä-näl, JEAN PIERRE FRANÇOIS ROLAND** (1854-1923). A French his-

torian who was born at Lyons, and in 1879 entered the French Palaeographic Institute, the École des Chartes. In 1885 he published the learned *Histoire des Arocats du Parlement de Paris*. His monumental work on Charles V. occupied 25 years of labor; three volumes were published from 1897 to 1916, and at his death two additional volumes remained unpublished. Delachenal was also the author of the *Grandes Chroniques de France* (1910-1916-1920).

**DELAGOA BAY.** See PORTUGUESE EAST AFRICA.

**DE LA GORCE.** See LA GORCE.

**DE LA MARE, WALTER** (1873- ). An English author, born at Charlton, Kent, and educated at St. Paul's Cathedral School, where he founded the *Chorister's Journal* (1889), which is still in existence. He left school at Easter in 1890, and worked for the Anglo-American Oil Company until 1908, when a small government grant and pension of £100 a year allowed him to devote all of his time to writing. At first he wrote for magazines under the name of Walter Ramal. There are three distinct sides to his work—his poetry, his juvenile and light prose, and his strangely abnormal and decadent prose such as *The Return* (1910), *The Memoirs of a Midget* (1921), *The Riddle and Other Stories* (1923), and *The Connoisseur and Other Stories* (1926). His other prose works were *Henry Brocken*, recounting his travels among the characters of literature (1904); *The Three Mulla-Mulgars*, the story of three monkeys (1910); *Crossings*, a fairy play (1921); *Ding Dong Bell* (1924); and *Broomsticks and Other Stories* for the young (1925). His poetical works include *Songs of Childhood* (1902); *The Listeners and Other Poems* (1912); *Peacock Pie* (1913); *Motley and Other Poems* (1919); *Collected Poems, 1902-1918* (1920); *Stuff and Nonsense, and So On* (1927); and *Selected Poems* (1927). His anthology *Come Hither* (1923) was very popular. Consult *Walter de la Mare: A Biographical and Critical Study*, by R. L. Mégroz (1924), *Figures in Modern Literature*, by John Boynton Priestly (1924), and Forrest Reid, *Walter de la Mare* (1929).

**DELAMARTER, ERIC** (1880- ). An American organist and composer, born in Lansing, Mich. After studying the organ with G. H. Fairclough in St. Paul and W. Middelschulte in Chicago, he went for further study to Guillemant in Paris (1900-02). During 1900-02 he was organist at the New England Congregational Church in Chicago, then at the First Church of Christ Scientist, and since 1914 at the Fourth Presbyterian Church. From 1911 to 1913, he was conductor of the Musical Art Society. In 1918 he was appointed assistant conductor of the Chicago Symphony Orchestra and in 1924 he organized the Solo Orchestra (25 performers), whose object is the performance of modern works written for unusual combinations of instruments. He was music critic for the *Chicago Record-Herald* (1908-09), *Tribune* (1909-10), and after 1910 for the *Inter-Ocean*. He has written two symphonies (G and G minor); two overtures, *Old New England* and *The Betrothal*; *Serenade* and three suites for orchestra; two concertos for organ and orchestra; and some chamber music.

**DELAND, MARGARETTA WADE** (1857- ). An American author (see VOL. VI). She is the author of: *The Hands of Esau* (1914); *Around Old Chester* (1915); *The Rising Tide* (1916,

1918); *Old Chester Tales* (1919, Introduction by Vida D. Scudder); *Promises of Alice* (1919); *Small Things* (1919); *Old Chester Secret* (1920); *The Vehement Flame* (1922); *New Friends in Old Chester* (1924); and *The Keys* (1926).

**DELANO, EDITH BARNARD** (?- ). An American author, born at Washington. She wrote: *Zebedee V* (1912); *The Land of Content* (1913); *The Colonel's Experiment* (1913); *Rags* (1915); *The White Pearl* (1916); *June* (1916); *To-morrow Morning* (1917); *Two Alice* (1918); and *The Way of All Earth* (1925). She also wrote feature photoplays and contributed to many magazines.

**DELANO, FREDERIC ADRIAN** (1863 ). An American railroad president born in Hongkong, China (see VOL. VI). He was appointed by President Wilson to the Federal Reserve Board in 1914, but resigned in June, 1918, to join the Army. He was commissioned major of the Engineering Corps and assigned to the staff of General Atterbury, director general of transportation at Tours, France. He was promoted to be colonel of the transportation corps in May, 1919, and discharged on Oct. 25, 1919. He was appointed receiver for the Supreme Court of the United States in the Red River Boundary Case, and was chairman of the international commission of the League of Nations to inquire into the production of opium in Persia.

**DELANO, LYMAN** (1883- ). An American railway official, born in Newburg, N. Y. He graduated from Harvard in 1906, and began his railway career in 1909 with the Atlantic Coast Line R. R., eventually becoming the executive vice president. He was an official and director in many other railroads and terminal companies. During the period of the World War, he was Federal manager for the A. C. L. and other railroads.

**DELANO, WILLIAM ADAMS** (1874- ). An American architect, born in New York City and educated at Yale University and at the École des Beaux Arts in Paris. He began practice in New York in 1903, and from that time until 1910 was professor of design in Columbia University. He collaborated on the plans for the Knickerbocker, Colony, and India House club buildings in New York.

**DELAWARE.** The forty-seventh State of the United States in size (2370 square miles) and the forty-sixth in population; capital, Dover. The total population increased from 202,322 in 1910 to 223,003 in 1920, a gain of 10.2 per cent; estimated population, 1928, 244,000. The white population rose from 171,102 (1910) to 192,615 (1920); the number of Negroes fell from 31,181 to 30,335; that of native whites increased from 153,682 to 172,805; foreign-born whites, from 17,420 to 19,810. The urban population grew from 97,085 to 120,767; the rural decreased from 105,237 to 102,236. The only large city is Wilmington (q.v.), with a population of 110,168 in 1920 and 87,411 in 1910.

**Agriculture.** While the estimated population of the State showed an increase up to 1928, the number of farms which had decreased from 10,836 (1910) to 10,140 (1920), made but a scant gain to 10,257 for 1925; acreage, 944,511 in 1920, fell to 899,641 in 1925. The total value of farm property showed a slight decrease from \$80,137,614 (1920) to \$72,708,416 (1925); and the average value per farm from \$7903 to \$7097. The percentage of tenancy

in 1925 was 35.8, as against 39.3 in 1920. Of the total 10,257 farms in 1925, 6515 were worked by owners, compared with 6010 in 1920; 74, by managers, compared with 144; 3668, by tenants, compared with 3986. The white farmers in 1920 numbered 9268, and increased to 9426 in 1925; Negro farmers, 827 in 1920, numbered 831 in 1925. The total number of dairy cows in 1920 was 37,878; in 1925, 33,793. The number of sheep decreased from 3220 to 1749. The estimated production of the chief farm crops in 1928 was: Corn, 4,448,000 bushels; wheat, 1,836,000; potatoes, 658,000; sweet potatoes, 980,000 bushels; and hay, 141,000 tons. Comparative figures for 1913 are corn, 6,206,000 bushels; wheat, 1,638,000; potatoes, 957,000 bushels; and hay, 94,000 tons. In 1927 the apple and peach crops were estimated at 1,150,000 and 287,000 bushels, respectively.

**Manufactures.** Delaware is not an important industrial State. The only city of more than 10,000 inhabitants is Wilmington, and the industries of the State are to a large extent concentrated there. This city had 61 per cent of the value of manufactured products in 1925. In that year there were in the State 419 manufacturing establishments; in 1914, 808; and in 1919, 668. The census of manufactures taken in 1927 indicated 446 establishments in the State. Wage earners engaged in manufactories in 1927 numbered 21,016; in 1925, 20,704; in 1914, 22,155; and in 1919, 29,035. The capital invested increased from \$60,905,671 in 1909 to \$69,323,927 in 1914, and \$148,207,598 in 1919. The total value of products increased from \$52,839,619 in 1909 to \$165,073,009 in 1919, and declined to \$125,406,332 in 1925, amounting to \$129,899,735 in 1927, but the war-time increase was due largely to the change in industrial conditions caused by the War, and these figures cannot be used to measure the normal growth of manufactures between 1909 and 1919. It will be noted that the number of establishments decreased to a large extent due mainly to conditions and the elimination of the smaller plants. The most important industries in point of value of products are those connected with the manufacture and tanning of leather. These were valued at \$16,989,208 for 1925; \$9,183,000 in 1914; and \$50,138,000 in 1919. Pulp goods ranked second, with a product valued at \$1,032,000 in 1909; \$9,385,000 in 1919. Car construction and repair products in 1909 were valued at \$3,251,000; 1914, \$3,551,000; and 1919, \$7,687,000; and the products of iron and steel, steel work, and rolling mills in 1909 was valued at \$1,715,000; in 1914, \$1,669,000; in 1919, \$7,115,000. In 1909, Wilmington had 261 establishments, with products valued at \$38,069,000; in 1919, 262, with \$121,040,000; and in 1925 the production attained \$76,502,000.

**Education.** The development of education in Delaware has gone on persistently for many years. As in other Southern States, the mixture of whites and Negroes in the population adds to the difficulty of educational advancement. In 1919 a new school code was put into effect. A school law, passed by the Legislature in 1920 and modified by the Legislature of 1921, provided for a bi-partisan State Board of Education; for improved methods for raising funds for school purposes; consolidations of school districts by referendum vote of the districts involved; continuation of vocational training in agriculture and home economics, and State support of high

schools. Sixty scholarships for the training of teachers in the University of Delaware were provided in 1919 by Pierre S. Du Pont and other members of the Du Pont family. There has been great improvement in the supervision of rural schools and in the provision of industrial training in the colored schools. The enrollment in the public schools increased from 36,000 in 1913 to 39,297 in 1925-26. Of this number, 33,170 were whites and 6127 were colored. In the colored elementary schools, 5830 were enrolled; in the colored high schools, 207. The total expenditure for public day schools for the academic year 1925-26 was: current, \$2,867,935; outlays for new buildings, sites, and equipment, \$774,726. The percentage of illiteracy in Delaware decreased from 10 in 1910 to 7.4 in 1920; among the native whites, from 4.2 to 2.6; among the foreign-born whites, from 19.7 to 18.2; and among the Negroes, from 32.9 to 24.6.

**Finance.** Expenditures in the year ending June 30, 1928, as reported by the U. S. Department of Commerce, were: for maintenance and operation of State governmental departments, \$4,826,035 (of which \$1,406,380 was aid for local education); for interest payments on debt, \$474,073; for permanent improvements, \$2,558,123; total, \$7,858,231 (of which \$2,383,939 was for highways, \$258,167 being for maintenance and \$2,125,772 for construction). Revenues were \$8,968,467. Property and special taxes formed 58.8 per cent of the total; departmental earnings and remuneration for services rendered by officials, 6.3 per cent sales of licenses and a sale tax on gasoline, 23.1 per cent. Property valuation was \$265,582,580; State taxation thereon, \$398,374. Net State funded debt was \$8,448,752. The chief part of the debt was for highways.

**Political and Other Events.** In 1914 a Republican candidate for the House of Representatives, Thomas W. Miller, was elected. Great industrial prosperity was brought about by the War. Some of the largest ammunition factories in America were located in the State. Several serious explosions occurred in ammunition factories during 1916. In 1916 Josiah Wolcott, Democratic candidate, was elected to the United States Senate, while John G. Townsend, Republican, was elected governor. In 1916 Hughes received 26,011 votes for President; Wilson, 24,753. In 1918 L. Heisler Ball, Republican, was elected Senator. In 1920 William D. Denny, Republican, won the governorship; for President, Harding received 52,858 votes; Cox, 39,897. In 1922, Thomas F. Bayard, Democrat, was elected Senator. R. P. Robinson (Republican) was elected governor in 1924. The vote for President was: Coolidge, 52,441; Davis, 33,445. In 1928 C. N. Buck (Republican) was elected governor, while Hoover received 68,860 votes for President, to 36,643 for Smith.

**Legislation.** In 1915 an agricultural commission was created. In 1917 the laws relating to the administration of the State government were amended, and so were the child-labor laws. A workmen's-compensation act was passed and measures were enacted to prevent monopolies in the buying and selling of commodities. The Legislature of 1919 created a banking department, passed school laws, and amended the criminal law. In 1921 the Legislature imposed an income tax for school purposes, amended the law in respect to alien land ownership, provided a tax on shares of banking corporations, estab-

lished a child-welfare commission, and adopted legislation for carrying out the education programme of 1920.

**DELBET, PIERRE LOUIS ERNEST** (1861- ). One of the leading surgeons of France. His chief hospital connection was with the Hotel-Dieu, and his principal works are *Du traitement des aneurysmes externes* (1899); *Des supurations pelviennes chez la femme* (1891); *Leçons de clinique chirurgicale faites à l'Hotel-Dieu* (1899); *Grands procès morbides* (1907); *Méthode de traitement des fractures* (1910). In collaboration, he published: *Affections chirurgicales des arrières* (1911, with Moquot); *Maladies de l'anus et du rectum* (1916, with Brechet); *Biologie de la plaie de guerre* (1918, with Fiessinger); *Nouveau traité de chirurgie*, with Le Dentu, which came out serially, the first volume in 1907. With Mendaro, he published *Cancers du sein* (1923).

**DELBÜCK, dël-bruk, HANS G. L.** (1848-1920). Professor of history at the University of Berlin, *Geheimregierungsrat* (see VOL. VI). In 1920 he became a member of the Historical Committee for the Imperial Archives. His works published since 1913 include *Regierung und Volkswohl* (1914, 1920); *Bismarcks Erbe* (1915); *Krieg und Politik*, 3 vols. (1919); *Geschichte der Kriegskunst*, 4th vol. (1920); *Kautsky und Harden* (1920); *Ludendorff, Tirpitz, Falkenhayn* (1920); *Ludendorffs Selbstporträt* (1922); and *Vor und nach dem Weltkrieg* (1925).

**DELCASSÉ, dël'kà'sà', THÉOPHILE** (1852-1923). A French statesman (see VOL. VI). In 1913-14 he served as Ambassador at Petrograd, and from 1914 to 1915 was Minister of Foreign Affairs in Viviani's cabinet, having previously served in this capacity in 1905-08 and in 1912. He was recognized as one of the most eminent of French statesmen, and was best known as the founder of the Entente. Consult "L'œuvre de Delcassé," by G. Raynal, in *Pages d'histoire*, No. 85 (1916).

**DELEDDA, GRAZIA** (1875- ). An Italian novelist (see VOL. VI), who received the Nobel Prize for Literature in 1926. Her later works include *Le colpe altrui* (1914); *Marianna Sirca* (1915); *L'incendio nell'uliveto* (1918); *La madre* (1920); *Il segreto dell'uomo solitario* (1921); *Chiaroscuro* (1921), and *Il Dio dei viventi* (1926).

**DELITZSCH, dël'lich, FRIEDRICH** (1850- ). A German Assyriologist (see VOL. VI) who was professor at the University of Berlin and member of the Akademie der Wissenschaften. His works published after 1913 include: *Sumerische Grammatik* (1914); *Sumerisches Glossar* (1914); *Die Grosse Täuschung* (1920; Part 2, 1921, 1922); *Lesen- und Schreibfehler im Alten Testament* (1920).

**DELIUS, FREDERICK** (1863- ). A British composer, born in Bradford, Yorkshire (see VOL. VI). The production of his opera *Fennimore und Gerda*, which was in rehearsal at Cologne in 1914, was prevented by the outbreak of the War, but had its première at Frankfurt in 1919. He added to the list of his major works: *Requiem* for chorus and orchestra; incidental music to Flecker's *Hassan*; a piano concerto in C minor; a violin concerto; a cello concerto; a concerto for violin and cello; for orchestra: *Brigg Fair*, *Life's Dance*, *Summer Night on the River*, *North Country Sketches*, *In a Summer*

*Garden*; two string quartets; three violin sonatas.

**DELL, FLOYD** (1887- ). An American novelist and critic, born at Barry, Ill. He entered the field of journalism at the age of 18 and in six years was the literary editor of the *Chicago Evening Post*. In 1914 he went to New York to associate himself with Max Eastman in the publication of *The Masses*, a periodical with a radical economic policy and an excellent literary department (1914-17). He did similar work on *The Liberator* (1918-24). Early attempts at writing did not reveal his true métier until the publication of his novel *Mooncalf* (1920). He followed the success of this work with *The Briary-Bush* (1921). These together made a full-length portrait of the American youth of the period: ambitious, curious, aesthetically-minded, but thwarted by the hostility of his environment and his own sentimental heritage. *Janet March* (1923) was a less successful attempt to do the same thing for the young American woman. Other books included: *Were You Ever a Child?* (1919); *Looking at Life* (1924); *Intellectual Vagabondage* (1926); *Outline of Marriage* (1927); *Upton Sinclair* (1927). In 1927 he edited with Paul Jordan Smith *An All-English Edition of Burton's Anatomy of Melancholy*.

**DELOIRME, dël-lörm', EDMOND** (1847- ). A surgeon general of France before and during the World War, many years before which he published his great work *Traité de chirurgie de guerre* in two volumes (1888-1893). When war was declared in 1914, he issued his manual, *Précis de chirurgie de guerre*, which was translated into English for the British Army in 1915. He published *Chirurgie de guerre—fractures* (1917); and *Les enseignements chirurgicaux de la grande guerre* (1920).

**DELTEIL, dël'ti', JOSEPH** (1894- ). A French writer who was born at Pieusse, near Carcassonne, educated in a seminary, and then became a notary's clerk. With the outbreak of the World War, he turned to literature, first attracting wide attention in 1925 when his *Jeanne d'Aro* received the Prix Femina-Vie Heureuse. Various orthodox critics branded it as sacrilegious but Delteil defended himself by claiming it to be a study of Joan the woman, not Joan the saint. In general, his work was fantastic and had a tendency to shock the conservative. His other works include the novels *Sur la fleuve Amour*; *Choléra*; *Les Cinq sens*; the poems *Le Cœur grec*, crowned by the French Academy (1920); *Le Cygne Androgyné*; *Ode à Limoux*; the essays *Discours aux Oiseaux*; *Mes Amours*; *La Passion de Jeanne d'Aro*; *Le Mal de Cœur*; *Perpignan*, and *De J.-J. Rousseau à Mistral* (1928); *On the River Amour* (1929); and the prose epics *Les Poilus* and *La Fayette* (1928).

**DE MILLE, CECIL BLOUNT** (1881- ). An American actor and motion-picture producer, educated at the Pennsylvania Military College and the American Academy of Dramatic Arts. After being successively playwright, actor, and theatrical producer, after 1914 he devoted himself entirely to production for the moving pictures. His best work includes: *Girl of the Golden West*; *The Warrens of Virginia*; *Oceanic*; *Joan of Arc*; *The Dream Girl*; *The Woman God Forgot*; *The Devil Stone*; *The Whispering Chorus*; *Don't Change Your Husband*; *For Better, For Worse*; *Male and Female*; *Why*

*Change Your Wife; Something to Think About; The Affairs of Anatol; Fool's Paradise; Manslaughter; The Ten Commandments; The Volga Boatman, and The King of Kings.*

**DE MORGAN, WILLIAM FRENCH** (1830-1917). An English novelist (see VOL. VI). *The Old Madhouse* was published posthumously in 1919, and *The Old Man's Youth*, De Morgan's incomplete novel, was published, with additions by his widow, in 1921.

**DE MUYTER, ERNEST** (?- ). A Belgian airman who won the Gordon Bennett balloon race in 1920, 1922, 1923, and 1924, thus becoming the permanent possessor of the original Gordon Bennett cup. A new trophy was then presented by the King of the Belgians. In 1925 De Muyter came in second, in 1926 third, and in 1927 sixth. He published *La navigation aérienne et les randonnées victorieuses du "Belgica"* (1925).

**DENBY, EDWIN** (1870-1929). An American lawyer and cabinet official born at Evansville, Ind. As a boy, he went to Peking with his father, then Minister to China, and served in the Maritime Customs Service during 1887-94. He then returned to the United States, was graduated in law at the University of Michigan in 1896, and was admitted to practice in the same year. In 1903 he was a member of the Michigan House of Representatives, then was elected from the First Michigan District to Congress, serving during 1905-11. During the War with Spain, he was a gunner's mate on the *Yosemite*, and when the United States entered the World War, he enlisted as a private in the United States Marine Corps, becoming a major on the Reserves' list in that Corps. By appointment of President Harding, he became Secretary of the Navy in March, 1921, but in response to a request from Congress to President Coolidge, he resigned from his office in March, 1924, and returned to Detroit, where he resumed the practice of his profession.

**DENEEN, CHARLES SAMUEL** (1863- ). A United States Senator (see VOL. VI). While engaged in the practice of law at Chicago, he was appointed United States Senator in 1925 to serve the unexpired term of the late Medill McCormick. He was elected to the same office as a Republican for the term 1925-31.

**DENERÉAZ, ALEXANDRE** (1875- ). A Swiss composer, born at Lausanne. He studied under the organist, E. Blanchet, and, from 1891 to 1895, at the Dresden Conservatory. In 1896 he succeeded his former teacher as organist at St. François in Lausanne and became conductor of a male choral society and teacher of theory at the Conservatory. In 1918 he was appointed *dozent* at the university. His works include three symphonies (C, C minor, and E minor); a symphonic suite, *Les Saisons*; symphonic variations, *Scènes de la Vie de Orpheus*; two symphonic poems, *Le Rêve* and *Épopée Symphonique*; the symphonic pieces, *Autour du monde*, *Au Tombeau de Tut-ank-amen*, *St. Antoine au Desert*; *Concerto Grosso*, for organ and orchestra; a violin concerto; a 'cello concerto; three cantatas; three string quartets; incidental music to Morax's *La Dime*; and organ sonatas.

**DENGEL, PHILIPP IGNAZ** (1874- ). German philosopher and professor of general history at the University of Innsbruck. He was born at Elbigenalp in the Tyrol, and studied at the universities of Innsbruck and Berlin.

He was elected member of the Austrian Historical Institute of Rome and specialized on Italian history and politics. His principal works are *Geschichte des Palazzo di San Marco in Rom bekannt als Palazzo di Venezia* (1909); *Die verschollene Mappa Mundi im Palazzo di Venezia* (1912); *Der italienische Irredentismus* (1912); *Palast und Basilica di San Marco* (1913); *Die Südgrenze Deutsch-Tirols* (1919); *Italien auf falschen Wege* (1919); *Südtirol im Lichte des italienischen Irredentismus, Nationalismus und Imperialismus* (1919). He edited *Glauben und Wissen unserer Welt* (1909-20) and, after 1927, *Bausteine für Leben und Weltanschauung*.

**DENGÜÉ, dën'gä.** The recent extensive epidemic of this affection in Greece recalls the fact that as late as 1922 it visited the Southern States between Alabama and Texas, inclusive, and the city of Galveston alone had 30,000 victims. For many years, the exact nature of this disease and the mode of its propagation were obscure, and it has been confused with epidemic influenza and even with yellow fever of an extremely mild type without jaundice. It is now known to be a specific disease having no connection with any other malady and is diffused by certain species of mosquito. Mosquito propagation is responsible for its occasional appearance in more northerly latitudes in the hot season of the year. The epidemic in Greece has led to some advance in our knowledge of the disease which has been transmitted experimentally by the species of mosquito known as the *Stegomyia fasciata*. The rate of diffusion is relatively slow, four or five months having been required for the disease to become pandemic, even over a small country like Greece. There were two waves of the epidemic, the first being small with several months of latency. As is sometimes the case with influenza, there was a notable tendency to hemorrhages. The alleged deaths from dengüé were mostly due to other affections, as paratyphus and tropical malaria. The original victims were from Egypt.

**DENIKIN, dën'kin, ANTON** (1872- ). A Russian soldier who served in the Russo-Japanese War and in the World War was chief of the general Staff under Generals Alexeiev and Brussilov. Following the Russian revolution, he was in command of the western front (June, 1917), and later in that year of the southwestern front. On General Kornilov's death, Denikin took command of his volunteer force Mar. 31, 1918, by February, 1919, with an army of about 100,000 men, he took the offensive against the Soviet government, and by November had established a fighting front from which he advanced a considerable distance in the interior of southern Russia. In February, 1920, he was defeated by the Soviet Army, and in April of that year, he retired to England, giving General Wrangel command over the troops that remained.

**DENIS, de-né, MAURICE** (1870- ). A French painter born at Granville, Manche. He was a professor at the École des Beaux-Arts, one of the so-called Symbolists, and later leader of the Neo-traditionalist School. He studied at the École des Beaux Arts and was strongly influenced by Paul Serusier, who favored synthesis and the use of form and color to express subjective states of mind. He was also one with the Rose Croix group who favored idealist decorative art rather than realism. In 1894 a visit to Italy impressed him with the value of

Italian quattrocento art and influenced his work to a large extent. He found the subjects for most of his important murals in religious pieces and classical mythology. Besides murals, he executed many easel pictures, illustrated books, and contributed to art reviews. In 1902, he was made a full member of the Société Nationale des Beaux Arts and in 1914 he became Chevalier de la Légion d'Honneur. His most important pieces were exhibited at the Salon des Indépendants and the Salon d'Automme, and he was also represented in the Luxembourg, Paris.

**DENISON UNIVERSITY.** A coeducational Baptist institution, founded in 1831, at Granville, Ohio. The student enrollment increased from 575 in 1914, to 889 in the autumn of 1928, while the summer session enrollment in 1928 was 160; the members of the faculty increased from 43 to 61 during the period under review. The productive endowment was increased from \$2,250,000 to \$3,200,000 between 1924 and 1928, and the income in 1928 was \$239,000. Marsh Hall, which was partially destroyed by fire in 1918, was fully reconstructed; Swasey Chapel, seating 1300, was completed in 1925, and plans were formulated in 1924 for the construction of Whistler Memorial Hospital, which was ready for occupancy on Jan. 1, 1929. The gift of a large tract of land by Col. Edward A. Deeds in 1924 made possible the enlargement of the campus and provided the site for Deeds Athletic Field, with a concrete stadium seating 6000, and a field house fully equipped. During the year 1928, the Military Science Department of the institution was discontinued, which resulted in the withdrawal of the Reserve Officers' Training Corps. The inauguration of Avery Albert Shaw, D.D., D.C.L., LL.D., as president of the University occurred on Oct. 21, 1927, and was attended by 96 official representatives from the various colleges and universities of the United States. The subject of Shaw's inaugural address was "A Christian College of Liberal Arts."

**DENMARK.** The smallest of the Scandinavian countries, whose area, by the accession of North Schleswig in 1920, was increased to 16,568 square miles, and whose population, by the census of Nov. 5, 1925, was 3,434,555. The increase in population over the previous census period was distributed evenly between the rural and urban centres. The population of the capital, Copenhagen, was 587,150, in 1925. Other large towns are Aarhus, 76,226; Odense, 52,376; Aalborg, 42,812; Horsens, 28,135; and Randers, 26,856. The population growth is about 1 per cent annually. Emigration was chiefly to the United States, 6300, in 1920; in 1921, 5309; in 1926, 5804. The pre-war yearly average was 9000. North Schleswig has an area of 1538 square miles and a population of 164,500 (1920). The Faeroe Islands count 22,835 inhabitants and an area of 540 square miles.

**Agriculture.** A movement from the land to the cities was shown in Denmark, the tillers of the soil dropping from 40 per cent of the total population in 1900 to less than 35 per cent in 1921. The movement toward the creation of small holdings has been continuous recently; the

law of 1919, in particular, aimed at the parceling up of large estates held in entail. Intensive cultivation and dairy farming are making continued headway through the initiative of the coöperative societies. The World War of course dealt Denmark's agriculture a severe blow, for its prosperity was dependent on its export trade particularly in dairy products and pork. After the War, recovery was rapid. In 1927 there were 523,785 horses, 2,911,949 cattle, 233,000 sheep, 3,728,623 swine, and 18,524,000 hens; in 1910, 535,018 horses, 2,253,982 cattle, 726,829 sheep, 1,467,822 swine, and about 15,000,000 hens. In 1927, 274,000 acres were under wheat; 453,000, rye; 882,000, barley; 1,012,000, oats; and 189,000, potatoes.

**Industry.** Small plants are the rule. In 1914 factories numbered 82,442; in 1925, 89,175. There were employed in 1912, 346,000 hands; in 1925, 392,000. Because of the demands of belligerents during the War, manufacturing activity increased considerably, but the world-wide depression of 1921 brought the country back to its pre-war status. The production of margarine, one of the most important industries, increased somewhat; in 1926 the output was 69,616 tons, compared with a 1911 output of 35,400 tons.

**Commerce.** The trade record for typical years follows, in millions of kroner; value \$268:

Year	Imports	Exports	Average exchange rate
1914	795	867	\$0.2625
1917	1,082	1,065	2959
1920	3,142	1,814	1577
1921	1,697	1,564	1779
1922	1,448	1,173	2095
1927	1,659	1,549	2673
1928	1,734	1,653	2680

In 1926 cattle to the value of \$13,076,000 were exported; pork and bacon to the value of \$218,498,000; and butter to the value of \$112,937,000. Exports and imports by countries for typical years in thousands of kroner, were:

IMPORTS			
Country	1912	1920	1926
United Kingdom	135,887	887,549	185,697
Germany	814,246	532,219	503,658
Sweden	69,060	189,904	98,112
United States	58,833	753,666	262,737
EXPORTS			
Country	1912	1920	1926
United Kingdom	37,312	671,981	856,879
Germany	181,646	826,471	291,217
Sweden	38,852	358,270	111,867
United States	10,568	90,719	12,153

In December, 1926, 1870 vessels of 1,108,300 tons were flying the Danish flag; 638 of these were steamers. During the War, official figures put the shipping losses due to submarine attacks and mines at almost 150 ships, of 230,000 tons. In 1926, 33,073 vessels of 10,431,000 tons entered Danish ports and 34,640 vessels of 10,608,000 tons cleared. Important maritime activities include the opening of the Odense Canal in 1921 and the commencement in 1922 of the Drogden, a channel for larger ships between the North Sea and the Baltic.

**Communication.** At the end of 1927, the country had 4721 miles of road, with 23,740 miles of by-ways. Railways totaled 3153 miles.

The length of state telegraph lines was 9070 miles. By means of radio-telegraph stations at Lyngby, Blaastrand, Copenhagen, and Amager, Denmark is in touch with ships at sea and with the United States.

**Finance.** The 1928-29 budget balanced at 412,404,000 kroner, with estimated expenditures for the year of 319,433,000 kroner and revenues of 324,338,000 kroner; with an actual surplus for the year of about 1,000,000 kroner for expenditure. In 1927 the total debt stood at 1,163,000,000 kroner; the 1913 figure was 348,040,923 kroner. The public debt on Mar. 31, 1929 was estimated at 1,172,000,000 kroner, or 340 kroner per capita.

**History.** During the war, because of her proximity to the belligerents, Denmark's position was precarious. Early in August, 1914, it was found necessary to fix prices and regulate exports to prove the country's desire for an effective neutrality. In the war atmosphere, opposing parties quickly came to terms with each other, and a revision of the constitution which had long been agitated was agreed upon. On June 5, 1915, the new constitution was signed by the King. It vested sovereign power in the King through his ministers, forbade the King to declare war without the consent of Parliament, and provided for universal suffrage and proportional representation. Amendments were promulgated on Sept. 10, 1920. The tightening of the submarine campaign in 1917 brought renewed hardships to the Danish population. Rationing was resorted to, and state and local agencies contributed extensively to poor and unemployment relief. Large sums also had to be expended on military defense. As a result, the Government was compelled to resort to loans to make up deficits appearing annually in the budgets.

Following the War, Denmark did not escape the difficulties of reconstruction which other countries experienced. German competition, made possible by the low value of the mark, naturally added to the uncertainty of economic conditions. The cost of living as measured by retail prices gradually rose, so that in 1921 it more than doubled that of the last pre-war year. Based on prices for 1913 considered as 100, the index number for October, 1920, reached 403, but by October of the next year it had fallen back to 202. Although wages up to 1921 kept pace with prices, a certain amount of unrest was generated by the demobilization of troops and the break in foreign markets, particularly among the transport workers. In general, however, the labor situation showed a marked stability, due largely to the high degree of organization of both employers and employees, the Combined Trade Unions enrolling about 280,000 factory and agricultural workers.

Denmark followed in the wake of other countries of northern Europe in establishing elaborate agencies for social insurance in industry. Illness and unemployment pensions and old-age pensions were wholly or partly provided by the state (the budget of 1923 carried 15,346,000 kroner for pension charges alone) and the state also contributed to the unemployment fund of the trade unions. A comprehensive compensation act, passed in 1916, was also in effect.

By 1922 agriculture had almost reached normal. Production of eggs, butter, and bacon showed a remarkable recovery. Late in August,

1922, the unemployed numbered only 30,000. But the country was not to weather the 1921-22 depression too easily. In September, 1922, the Danish Landmandsbank, the most important Danish banking institution, suddenly collapsed, due to business involvements based on the high price levels of preceding years. The Government was obliged to effect a reorganization. Ninety million kroner of the outstanding capital had to be written off, while the Danish National Bank was called on to contribute 30,000,000 kroner toward the bank's new surplus. Public confidence was diverted more and more from private banking and centred in the Danish National Bank. Denmark's foreign trade received a severe blow in 1922, when the United States emergency tariff imposed what seemed prohibitive rates on Danish goods. Of a piece with the economic distress was the renewed interest in emigration schemes. Plans were launched in 1922 for the emigration and settlement of Danish colonists in Madagascar, Lithuania, Central America and South America.

After a bitter political contest, a plebiscite in December, 1916, approved the sale of the Danish West Indies or Virgin Islands to the United States for \$25,000,000. A further diminution of the Danish Empire took place in 1918 when Iceland (q.v.) was granted its independence; thenceforth, Iceland and Denmark were connected only by a personal union under the Danish King. Greenland (q.v.) alone remained a colonial possession. In 1920 Denmark regained part of the province of Schleswig which had been wrested from her by Prussia in 1864. The Peace Treaty provided for two plebiscites in North and Central Schleswig, respectively, and under an international administration, they were held in February and March, 1920. The result was favorable for Denmark in North Schleswig, the vote being 75,000 for union, and 25,000 against; while in the Central district the natives decided by a vote of 51,000 to 12,000 to remain a part of Germany. On Sept. 21, 1920, citizens of Schleswig took part in the Danish general elections for the first time. The parties returned to the Lower House numbered 52 Liberals, representing the farmers; 18 Radicals, representing the small landholders; 48 Socialists, representing the city workers; 27 Conservatives, sitting for the middle class; 3 for Trade Party; 1 Schleswig (German Party). The ministry therefore was formed by the Liberals. The Liberal Premier Neergaard, supported by a parliamentary bloc, remained in power during the troublesome reconstruction years, and was not overthrown until 1924, when parliamentary elections gave victory to the Social Democratic Party (the labor party), despite the inclusion of a capital-levy plank in its platform. After the victory at the polls, a Social Democratic Cabinet was formed under the premiership of Theodore Stauning—but it commanded a majority of only two or three votes, the strength of the parties being: Social Democrats, 55; Liberals, 45; Radicals, 20; Conservatives, 28; Germans, 1. Skillful maneuvering was required to keep the ministry in power. Late in 1924, however, it did not hesitate to propose practically complete disarmament, on the theory that the country could not be defended in time of war anyway and might as well save the expense of a military establishment. The bill introduced into Parliament called for the replacement of the army by a small

police and patrol force of not more than 7000, the abolition of the navy, and the razing of fortifications. Throughout 1925 the proposal was discussed and the bill, with several changes, was finally put through the Lower House by a majority of one vote (Mar. 1926). In the following year, however, it was rejected by the Landsting.

The most serious labor troubles in the history of the country began in March, 1925, when existing wage agreements expired and new terms could not be agreed upon. Metal industries, cement and sugar factories, the building trades, etc., were drawn into the controversy, which at one time affected 100,000 workmen and threatened to paralyze the whole economic life of the country. The combined strike and lockout lasted until June 8, when government arbitrators finally effected a compromise.

The stabilizing of the krone, which government policy brought rapidly upward toward par, also entailed much economic distress and unemployment. The Government proposed to relieve conditions by granting subsidies to the industries most affected, the money to be raised by a special capital tax. When this proposal failed of parliamentary support, the Government went to the country. The elections on Dec. 2, 1926, resulted in the loss of two seats by the Social Democrats and four by the Radicals, thus wiping out the ministry's slender majority. The Stauning cabinet thereupon resigned and was succeeded in mid-December by a Liberal Party cabinet headed by M. Madsen-Mygdal, which announced a thoroughgoing policy of retrenchment in government expenditures and carried it through in 1927. Due to this policy and other factors, trade and manufacture enjoyed an encouraging revival in 1928.

The question of defense continued to be a troublesome one. The Government's proposal, in December, 1927, of a programme which would increase the effectiveness of existing military forces through reorganization but would reduce military appropriations to accord with the higher value of the krone was opposed both by the Conservatives, who insisted on a greater military establishment, and by the Socialist advocates of disarmament. A similar proposal was presented again by the Government in October, 1928, and aroused heated debate in and out of Parliament. When the measure came to a vote in March, 1929, the Conservatives refrained from voting because of the defeat of their amendment providing for increased forces, and the Government fell. Elections were held April 24, and resulted in a victory for the Social Democrats, who obtained 61 seats, as against 53 in the former Parliament. The Liberals lost 3 of their 46 seats and the Conservatives 6 of their 30. The Radicals' strength remained at 16 votes, the Justice Party obtained 3 seats in place of 2 before, and the Schleswig or German Party kept its single seat. Former Premier Stauning formed a ministry practically the same as the one he had headed before. He proposed to press the disarmament measure, and in spite of the fact that the Upper House was in the control of the opposition, it was felt that because of the sentiment of the country, as shown in the elections, the measure stood a fair chance of being adopted.

In foreign affairs the post-war years were comparatively uneventful. In 1924 Norway and Denmark arrived at an understanding which removed a disagreement of some years with regard

to hunting, fishing, etc., on the east coast of Greenland. Denmark later extended to Great Britain and France the same rights as to Norway. This period also saw the signing of a series of treaties of trade and arbitration with European countries. Soviet Russia was recognized in 1924 and agreements or treaties relating to trade and shipping were concluded with Poland, Latvia, and Czechoslovakia.

With her neighbors to the north, Denmark's relations became particularly cordial. In 1924 a series of agreements were effected establishing Boards of Conciliation to deal with any serious difficulties that might arise between Denmark, Norway, Finland, and Sweden, and later similar arrangements were made with Switzerland, Germany, and other countries. Treaties of arbitration likewise were signed with Germany, France, Poland, Czechoslovakia, and the northern Scandinavian countries, and in 1928 with the United States. The Kellogg Treaty outlawing war was ratified by the Rigsdag on Mar. 2, 1929. In 1928 the only tension with international bearings was that between Denmark and Germany over affairs in Danish and German Schleswig. It was eased when improved economic conditions quieted an unrest in Danish Schleswig which at one time had threatened to break out in a revolt, and when the desires of the population of German Schleswig with respect to their educational needs were satisfied.

**DENNEBT, EBERHARD** (1861- ). A German writer on nature and popular philosophy, who was born at Putzerlin near Staargard, Pomerania. He studied at the universities of Marburg and Bonn, and was successively assistant at the Botanical Institute of Marburg, director of the Keplerbund, and editor of the nature department of the *Deutsche Encyclopadie*. Among his numerous works are *Moses oder Darwin* (1907); *Haeckels Weltanschauung naturwissenschaftlich beleuchtet* (1908); *Die Zelle ein Wunderwerk* (1909); *Die geschichtliche Entwicklung der Descendenztheorie* (1910); *Die Welt für sich und die Welt mit Gott* (1913); *Mehr Naturfreude für die Jugend* (1914); *Gibt es ein Leben nach dem Tode?* (1915); *Gott, Seele, Geist, Jenseits* (1916); *Not und Mangel im Lichte der Entwicklung* (1916); *Der Staat als lebendiger Organismus* (1920).

**DENNETT, TYLER** (1883- ). An American author, born at Spencer, Wis., and educated at Bates College and at Williams College. From 1914 to 1916, he was associate editor of *The World Outlook*. He directed the publicity of the Methodist centenary (1916-18), and in 1919-20 held the same position in the Inter church World Movement. He lectured on American history at Johns Hopkins, 1923-24 and since 1927. Since 1924 he has been chief of the Division of Publications, Department of State. He is also known as a lecturer on Asia, having traveled widely in the Orient and in Africa. He is author of *The Democratic Movement in Asia* (1918); *A Better World* (1920); *Americans in Eastern Asia* (1923); *Roosevelt and the Russo-Japanese War* (1924).

**DENNIS, ALFRED PEARCE** (1869- ). An American diplomat, born in Worcester Co., Md., and educated at Princeton University. During the period 1894-1907, he was professor of history at Wesleyan University (Conn.) and at Smith College. In the latter year, he resigned because of ill health, and engaged in business. In 1918 he was commercial attaché at the American Em-

bassy at Rome, and in 1921 held the same post in London. As a representative of the Department of Commerce, he made investigations for Secretary Hoover in Central and Eastern Europe (1922). He became assistant to Mr. Hoover at Washington in 1924 and in 1925 was appointed a member of the U. S. Tariff Commission. A student of political history and economics, he has made frequent contributions on those subjects to the *Atlantic Monthly*, the *Yale Review*, *International Journal*, *Saturday Evening Post*, etc.

**DE NOAILLES, COUNTESS ANNA.** See NOAILLES, COUNTESS ANNA DE.

**DENT, EDWARD JOSEPH** (1876- ). A noted British musicologist, born at Ribston, Yorkshire. He studied at Eton under C. H. Lloyd and later at Cambridge under C. Wood and C. V. Stanford. In 1902 he was elected Fellow of King's College, Cambridge, and soon after began to attract attention through his scholarly researches concerning various periods of musical history. In 1919 he became critic of the *Athenæum* and in 1926 succeeded his former teacher as professor of music at Cambridge. He was one of the organizers of the British Music Society (1919) and was largely instrumental in developing the first Salzburg Festival (1922) into the International Society for Contemporary Music, of which he was the first president. He contributed to Grove's *Dictionary of Music and Musicians*, Cobbet's *Cyclopædia of Chamber Music*, and wrote the chapter on French music for Tilley's *Modern France* and the chapter on English music for Adler's *Handbuch der Musikgeschichte*. He is the author of *Alessandro Scarlatti: His Life and Works* (1905), *Mozart's Operas* (1913), *Terpander or Music and the Future* (1926), *Foundations of English Opera* (1928).

**DENVER.** The capital of Colorado. The population increased from 256,491 in 1920 to 294,200 in 1928, by estimate of the Bureau of the Census. In 1916, after three years' trial of the commission form of government, Denver went back to the mayor-council form. The new charter provided for a small council of nine men and assigned wide powers of appointment and removal to the mayor. Since 1918 the water system has been municipally owned. Zoning and city-planning provisions were put through in 1924, and a programme of paving carried on within the city. From 1924 to 1928, approximately \$7,000,000 was spent on new buildings for the city's public schools, unusually high teaching standards were established, and an improved curriculum adopted. In 1928 Denver completed plans for the construction of the new City and County Administration Building upon its Civic Centre, the structure to cost \$4,250,000. The assessed valuation of property in Denver in 1927 was \$440,118,465, and the net indebtedness was \$32,087,418. The value of manufacturing increased from about \$70,500,000 in 1913 to \$129,889,181 in 1927, and the number of establishments from 738 to 789. According to the U. S. Census of Distribution for 1926 and the U. S. Census of Manufactures for 1927, Denver has an average of 45,000 wage earners in its manufacturing, wholesale, and retail establishments. Its wholesale sales amount to \$323,599,800 yearly. Bank clearings in 1928 were \$1,863,583,000.

**DENVER, UNIVERSITY OF.** A coeducational institution at Denver, Colo., under the auspices

of the Methodist Episcopal Church; founded in 1864. The enrollment increased from 1159 in 1913 to 2714 in 1928-29, and the faculty from 132 members in 1916 to 177 in the autumn of 1928. The summer-school enrollment in 1928 was 820. The library increased from 38,000 to more than 50,000 volumes. In 1924 the University received as a gift the Foster Buildings Property and Leasehold, which, less indebtedness, was estimated at \$500,000. Chancellor, Frederick Maurice Hunter, A.M., Ed.D.

**DEPAUW UNIVERSITY.** A coeducational institution at Greencastle, Ind., under the auspices of the Methodist Episcopal Church; founded in 1837. DePauw grew steadily during the period 1913 to 1928, increasing its student body from 1000, in the former year, to 1616 in the autumn of 1928, with an additional registration of 133 in the summer session of 1928. The total number of volumes in the library was increased to 68,059 in 1928; and the number of members on the faculty was increased from 50, to 91 in the liberal arts college, and 16 in the school of music. The equipment of the University was augmented by the erection of Rector Hall, a dormitory for women; the Clem Studebaker Memorial Administration Building; Longden Hall, a dormitory for men, in 1927; and Lucy Rowland Hall, a dormitory for women, in 1928. The productive funds were increased from \$1,300,000 to \$5,297,853, which included \$2,124,573 assets of the Rector Scholarship Foundation. Additions to the latter fund included approximately \$650,000 in 1927 and \$146,741 in 1928. In the latter year, the University also received \$25,000 to establish the Albert J. Beveridge Fellowship for research in American history. G. Bromley Oxnam, D.D., was inaugurated president in October, 1928.

**DEPENDENTS, DEFECTIVES, DELINQUENTS.** See CHILD WELFARE; MOTHERS' PENSIONS; and JUVENILE COURTS.

**DEPEW, CHAUNCEY MITCHELL** (1834-1928). An American lawyer, orator, United States Senator and railway official (see VOL. VI). He was strongly opposed to pacifism from the outbreak of the World War, and in 1915, after the sinking of the *Lusitania*, urged drastic action against Germany by the United States. Despite his advanced years, he attended to the duties of the chairmanship of the entire New York Central railway system, which position he filled from 1898 until his death. He was an active worker in the cause of good feeling between England and the United States. He published *Some Views on the Threshold of Fourscore* (1914), and *Speeches and Literary Contributions at Fourscore and Four* (1918).

**DEPTH BOMB.** See BOMB, DEPTH.

**DERAIN, ANDRÉ** (1880- ). A French painter, born at Chatou, Seine-et-Oise. He first studied with Carrière, and later fell under the influence of Van Gogh, finally adopting the method of Cézanne, the master of "Les Fauves." About 1908 Derain commenced experimenting in cubist painting, and he gradually adopted the style of the new school, becoming a leader of the younger artists. From the first, his color was subdued, and gray tones predominate in his later landscape and figure paintings. He also did wood engraving. His work includes: "Les Baig-neuses" (1908); "Paysages de Camis" (1909); and "La Route d'Alban" (1921). See PAINTING.

**DERBY, EDWARD GEORGE VILLIERS STANLEY, SEVENTEENTH EARL OF** (1865- ). An English

public official, cabinet minister, and diplomat born in London. He was educated at Wellington College, and later served in the Grenadier Guards (1885-95) and as aide-de-camp to the Governor General of Canada. He was a Lord of the Treasury (1895-1900), chief press censor in South Africa (1900), financial secretary to the War Office (1900-03), Postmaster General (1903-05), member of Parliament from West Houghton division of Lancashire (1892-1906), and Director General of Recruiting (1915-16). In February, 1916, he became chairman of the military air service joint committee, from which office he resigned two months later, and in July of the same year, upon the formation of Lloyd George's government, he accepted the secretaryship of War. In 1918 he was appointed Ambassador to France, from which post he resigned in 1920. From 1922 to 1924, he was again Secretary for War.

**DERCUM, FRANCIS XAVIER** (1856- ). An American neurologist (see VOL. VI). He became professor emeritus of Jefferson Medical College in 1925. He published *Hysteria and Accident Compensation* (1916); *An Essay on the Biology of Mind* (1922); *The Biology of Internal Secretions* (1924), and *Physiology of the Mind* (1925).

**DESCAMPS, dâ'kân', BARON EDOUARD** (1847- ). A Belgian jurist (see VOL. VI). He was president of the International Parliamentary Conference of Commerce in 1928. His later works include: *Recueil international des traités du 19e siècle*, vol. i, 1801-25 (1914), *Recueil international des traités du 20e siècle*, vol. vi, 1906 (1914), both written with others; *Rapport à la Conférence de la Haye sur le règlement pacifique des conflits internationaux* and *Le génie des religions* (1923).

**DESCAVES, dâ'kâv', LUCIEN** (1861- ). A French author (see VOL. VI), who sometimes wrote under the pseudonyms of Compère Guilléri. His later works include: *Bribibi* (1911); *Ateliers d'aveugles* (1912); *Philémon* (1914); *Barabas* (1914); *La Maison anacréontique* (1916); *Dans Paris bombardé* (1919); *La Saignée* with Nozière; *Pierre Dupont*, a comedy (1922); *Le cœur ébloui*, drama (1926), and *Les fautes de l'amour*, drama (1928). Consult *Lucien Descaves*, by Émile Morelly.

**DESCHAMPS, ALBERT**. See **PSYCHOLOGY, ABNORMAL**.

**DESCHANEL, dâ'shâ'nêl', PAUL** (EUGÈNE LOUIS) (1856-1922). A French statesman and author (see VOL. VI). In January, 1920, he was elected President of France, but his health soon began to fail, and in May, while on a train near Montargis, he fell from the window, suffering injuries which finally obliged him to resign the Presidency. Though he afterwards appeared in the Senate for a short time, his career was practically over. In 1920 he published *Gambetta*.

**DES MOINES, dē moin'**. The capital of Iowa. The population increased from 86,368 in 1910 to 126,468 in 1920, and to 151,900 in 1928, according to the estimate of the Bureau of the Census. Its area is 55.91 square miles. With a commanding and central location and with a great system of railroad lines and highways radiating in every direction, Des Moines is the industrial, commercial, political, social, financial, and governmental centre of the State. Between 1914 and 1924, the State Capitol Park was increased from 18 to 83 acres by the razing of several city blocks, and a new municipal court

and public safety building was erected on the river front Civic Centre. A diagonal boulevard, Keosauqua Way, was constructed, connecting the business district with the northwest residential section, and Fifth Avenue was widened and graded at a cost for the two projects of more than \$1,000,000. Locations for new units of the public-school system were purchased, and a building programme was partially completed, involving a final cost of approximately \$7,000,000. A new building to house the offices of the Northwestern Bell Telephone Company and two of the exchanges and another building to house the east side exchange and a new set of underground cables have been erected at a cost of \$3,000,000. The U. S. Government is constructing a new building to house Federal offices.

There are more than 400 factories in Des Moines manufacturing a thousand or more different products, the value of which exceeds \$100,000,000 annually. The pay roll in 1927 for 56,547 employees amounted to \$74,679,841. About one-fourth of Des Moines's factory output is made from raw materials produced in Iowa. In addition to being a great industrial and commercial centre, Des Moines is one of the largest insurance centres in the West. It has 43 home offices whose annual income is more than \$100,000,000 and whose total assets are more than \$300,000,000. Bank clearings in 1928 amounted to \$520,231,000. Des Moines is also one of the six largest publishing centres in the United States. More than 80 publications, with a total subscription list of more than 6,000,000 and with issues totaling 148,000,000 annually, are published regularly in Des Moines. This city leads in agriculture publications, its 14 farm journals having a combined circulation of approximately 3,000,000. Iowa's capital received an early start in the development of aviation, and effort is being made to make it an aviation industry centre, as well as an important city on commercial and mail air routes. The taxable valuation of property in Des Moines subject to ad valorem taxes for the city corporation was \$79,896,662 in 1928. The per-capita tax levy for the city, school, State, and county was \$51.59. The net indebtedness, funded or fixed debt less sinking fund assets, was \$18,412,153. Des Moines leads the nation in home ownership with 51.1 per cent.

**D'ESPEREY, LOUIS FRANCHET**. See **FRANCHET D'ESPEREY, LOUIS FÉLIX MARIE FRANÇOIS**.

**DESSOIR, dâ'swär', MAX** (1867- ). A German psychologist, born at Berlin. He was educated in the German universities and passed through the academic *cursus honorum*, becoming professor at the University of Berlin in 1920. As editor of the *Zeitschrift für Ästhetik und allgemeine Kunstwissenschaft*, he was one of the leaders in the empirical study of the principles of taste. He was also interested in the various phases of abnormal psychology and psychical research, and published his findings in a volume on *Jenseits der Seele* (On the Other Side of the Soul, 1920). His *Geschichte der Psychologie* (1911) was translated into English under the title of *History of Modern Psychology*. Among his other works are *Eine Bibliographie des modernen Hypnotismus* (1890), *Das Doppel-Ich* (1896), *Geschichte der neueren deutschen Psychologie* (1903), *Ästhetik und allgemeine Kunstwissenschaft* (1906), *Philosophisches Lesebuch* (1911), *Jenseits der Seele* (1920), and *Diesseits der Seele* (1923).

**DESTROYER.** See **VESSEL, NAVAL.**

**DETERDING, dè'têr-dîng, SIR HENRI WILHELM AUGUST** (?- ). A Dutchman, the managing director of the Royal Dutch-Shell Company. In 1890 Kessler of the Royal Dutch Petroleum Company, raised Deterding from a bank clerk in Java, where he was born, to be his assistant, and six years later, on the death of Kessler, Deterding was elected managing director of the company. In his conflict with the Standard Oil in China, he made an agreement with the British Shell Company and the French Rothschild concerns whereby they distributed his products (1902). After four years of this agreement, which was not carried out without friction, a merger was arranged, and Deterding was made director of the powerful new interest, which, among other things, provided fuel for the British Navy. During the World War, he was in control of the British petroleum and benzine supplies, and by never allowing the transportation facilities of the army and navy to stall, contributed largely to the allied victory. In 1920 he was made an honorary Knight Commander of the Order of the British Empire.

**DETLEFSEN, JOHN A.** (1883- ). An American zoölogist born at Norwich, Conn., and educated at Dartmouth and at Harvard. He was Austin teaching fellow of Harvard (1908-12) and was at the University of Illinois as assistant professor of genetics (1912-18), associate professor (1918-19) and professor (1919-22). He was professor of the Wistar Institute of Anatomy, Philadelphia, from 1922 to 1925, when he became associate editor of *Biological Abstracts*. Professor Detlefsen wrote on genetics, especially in domesticated animals. He was co-author of *Our Present Knowledge of Heredity* (1926).

**DETONATORS.** See **EXPLOSIVES.**

**DETROIT.** The chief city of Michigan. Its population rose from 405,766 in 1910 to 993,678 in 1920 and to 1,378,900 in 1928 by estimate of the Bureau of the Census. In 1914 the area of the incorporated city was 41.76 square miles; in 1924, 92.66 square miles; and in 1928, 139 square miles. During the five-year period, 1923-1927, Detroit built 554 miles of new street paving and 223 miles of alley paving at a cost of \$50,479,540 in an endeavor to keep pace with the growth of the city. In 1928 the public works department reported that there were 1495 miles of paved streets, 2238 miles of sewers, 3401 miles of water mains, 2301 miles of gas mains, and 868 miles of street-car and bus lines. At a special election in April, 1928, Detroit voters approved a bond issue of \$30,000,000 for sewer construction, and a plan for the widening of Woodward Avenue to a breadth of 204 feet, with removal and replacement of the Grand Trunk Railway tracks to supply the necessary space, was declared valid by the State Supreme Court. In April, 1922, the city of Detroit voted an authorization of the purchase of the street railway lines of the Detroit United Railway Company for \$19,850,000 and began operation of the lines on May 1. The trackage purchased was 311 miles, and the city added 72 miles of new line to the system. A rapid transit subway plan, which has been under consideration for several years, was submitted to the voters in April, 1929, but failed of approval. The plan offered was the joint proposition of the Street Railway Commission and the Rapid Transit Commission and provided for the construction of the first unit of the system at an estimated cost of \$91,000,000.

Among the many public works which have been constructed since 1914 are the Belle Isle Bridge, the new public library, and the Detroit Institute of Arts, each of which cost \$3,000,000. The River Rouge improvements, including dredging and a new bridge, cost about \$10,000,000. A Detroit-Canada vehicular tunnel under the Detroit River and an international bridge over the river, connecting the city with Windsor, Ont., are under construction at a cost of more than \$25,000,000.

Detroit has an extensive municipal airport, which was established in 1927, two military air fields, two Naval Reserve aviation bases, and several commercial airports, the most important of which is the one operated by the Ford Motor Co. The area of the municipal field comprises 250 acres. At the election in November, 1928, a bond issue of \$5,000,000 was authorized for the acquisition of additional land and the further development of the site, including structures, lighting, and equipment. A hangar and exhibition building, to cost approximately \$1,000,000, are under construction. The exhibition building will be available for the annual All-American Aircraft Show.

The Port of Detroit is one of the most important on the Great Lakes, in 1920 ranking first in exports and imports. In 1927 the total foreign cargo commerce was 338,223 tons. The available water frontage is 24 miles, with more than 13 miles of improved harbor frontage. The port is the home of five steamship lines operating 37 vessels. Detroit's principal industries include motor vehicles, bodies, and parts; iron and steel products; drugs, chemicals, and allied products; brass, copper, and non-ferrous metal products; machinery, foundry, and machine-shop products; paper and printing products; slaughtering and meat packing. In 1928, 254,269 persons were employed in 2078 plants receiving \$429,321,000 in wages; the total value of products manufactured in the metropolitan area was \$2,217,717,000. In 1928 building permits approximating \$10,000,000 were taken out by 219 manufacturing concerns for the construction of new plants or additions to factories. Of these, 14 companies had programmes involving between \$100,000 and \$150,000. The automobile industry, which is represented by such well-known firms as the Ford Motor Co., General Motors Corp., Cadillac Motor Car Co., Hudson Motor Car Co., Chrysler Motor Corp., Studebaker Corp., has especially shown a vast expansion during recent years. There are 3 National banks, 15 State banks, and 11 trust companies in Detroit, whose capital, surplus, and undivided profits in 1928 amounted to \$115,885,914.

In 1928, 28,550 permits were issued for building construction in Detroit and represented a value of \$129,260,285. Among the buildings erected was the Union Trust Building, 40 stories in height and the tallest but one building in the city. The assessed valuation of property in 1928, according to local estimate, was \$3,562,213,760; the net debt in 1927 was \$214,224,000. Detroit has 185 elementary schools, 14 intermediate schools, 14 high schools, 153 parochial schools, 14 schools for the anemic, and 5 college units. The Cass Technical High School, which is one of the largest high schools in the United States, has more than 13,000 pupils. The total public-school enrollment in 1928 was 232,235; the parochial-school enrollment was 72,132. In 1928 Detroit was declared winner in the inter-

chamber of commerce fire-waste contest for the best showing of fire-waste reduction.

**DETROIT, UNIVERSITY OF.** An institution of higher education at Detroit, Mich., under the auspices of the Roman Catholic Church, founded in 1877. The enrollment of the University increased from 792 in 1918 to 3044 in the autumn of 1928; there were 332 students in the high school in the same year. The faculty increased from 69 to 181 members and the library from 18,000 to 50,000 volumes. A day school of commerce and finance as well as night courses were added in 1922. The institution is conducted by the Fathers of the Society of Jesus, whose services, as well as those of several lay professors, are given gratis. In 1928 productive funds amounted to \$643,213.35. A faculty residence, power house, engineering, commerce and finance, chemistry, and science buildings, and the Soldiers' Tower were completed in 1927. President, the Rev. John P. McNichols, S.J., Ph.D.

**DETTMANN, LUDWIG** (1865- ). A German painter who was born in Flensburg, studied art in Hamburg and at the Academy of Berlin, and traveled in France, Holland, and England. He is known for his landscapes, portraits, and mural paintings. He exhibited in Berlin, Munich, Vienna, Chicago, and Venice, where he received the Grand Prix at the International Art Exhibition (1897), and Milan, where he became honorary member of the Academy of Fine Arts.

**DEUSSEN, doiss-sen, PAUL** (1845-1919). A German philosopher and Orientalist (see Vol. VI). He completed his *Allgemeine Geschichte der Philosophie* in 1917. His autobiography was published posthumously in 1922 by his widow, Erika Rosenthal-Deussen.

**DE VALERA, dê vâ-lër-ä, EDWARD** (EAMONN) (1882- ). An Irish Republican leader born in Charlesville, County Cork, Ireland, and educated at the Christian Brothers' School (Charlesville), Blackrock College, and the Royal University of Ireland. He taught mathematics and languages at several of the Catholic Colleges of Ireland. He first attracted notice in 1916 by his activity in the Easter rebellion, in which he commanded a band of insurgents. This movement, involving a "Provisional Government of the Irish Republic"—it was to be provisional only until the successes of its arms made it permanent—called for, and received, popular support against British rule. After this outbreak had been put down, he surrendered and was sentenced to death, but the sentence was commuted to life imprisonment. He was released in the general amnesty of June, 1917, and wherever he appeared in Ireland he received enthusiastic demonstrations. East Clare elected him to Parliament by a 30,000 majority, and he held this seat until the formation of the Irish Free State in 1922. The Sinn Fein convention elected him President of the Irish Republic (1917) and he was President of Sinn Fein from 1917 to 1925. In the spring, 1918, he was rearrested for his part in plotting another rebellion and a German invasion, but in February, 1919, he escaped from the prison at Lincoln, England, and made his way to the United States. He returned to Ireland in 1921 and became Chancellor of the National University of Ireland. In the same year, negotiations for settlement of the Irish question were begun with the British government. He was against the compromise which resulted in the establishment of the Irish Free State and he op-

posed the Cosgrave government. But shortly he became the leader of Fianna Fail, a Republican party which was more moderate than Sinn Fein. This group was willing to accept the Free State if the oath of allegiance to the King was abolished. However, in 1927 de Valera and his associates took the oath and on August 12 entered the Dail or Chamber of Deputies, thus becoming an opposition party within the government.

**DEVINE, EDWARD THOMAS** (1867- ). An American leader in social work (see Vol. VI). In 1916 he was special agent at the American Embassy in Petrograd. He was chief of the Bureau of Refugees and Relief under the American Red Cross Commission to France (1917-18); member of the U. S. Coal Commission (1922-23); and professor of social economy and dean of the graduate school, American University, Washington, D. C., since 1926. His later works include, *The Normal Life* (1915), *Disabled Soldiers and Sailors* (1919); *Social Work* (1921); *Economic Problems of Mining, Marketing, and Consumption of Anthracite and Soft Coal in the United States* (1925).

**DEVONPORT, HUDSON EWBANK KEARLEY, FIRST VISCOUNT** (1856- ). An English politician and business man, born at Uxbridge and educated at Cranleigh School. He entered the firm of Kearley and Tonge, subsequently becoming a senior partner. In 1892 he entered Parliament as Liberal member for Devonport (1892-1910). He was parliamentary secretary to the Board of Trade (1905-09), was chairman of the Port of London Authority (1909), first Food Controller (1916), and secretary to the Sugar Commission (1917). He was created a baronet in 1908, was raised to the peerage in 1910, and in 1917 was created a viscount.

**DEVONSHIRE, VICTOR CHRISTIAN WILLIAM CAVENDISH, NINTH DUKE OF** (1868- ). A British statesman educated at Cambridge. He entered Parliament as a Liberal in 1891, was Financial Secretary to the Treasury (1903-05), a civil Lord of the Admiralty (1915-16), Governor-General of Canada (1916-21), and Secretary of State for the Colonies (1922-24). From 1923 he was High Steward of Cambridge University, and in 1928 was Chancellor of Leeds University.

**DEVORE, DANIEL BRADFORD** (1860- ). An American soldier, born in Monroe Co., Ohio. He graduated from the United States Military Academy in 1885, served during the Spanish-American War as captain of volunteers and was commissioned captain of the Regular Army in 1899. He rose to the rank of colonel in 1910 and in the following year was appointed brigadier general. He had charge of the training of troops in Illinois and commanded the 167th Brigade in France in 1918. In the following year, he was commander of Camp Logan, Houston, Tex., and in 1920-21 commanded the 10th Infantry at Camp Sherman. In 1921-22 he was adjutant general at Governor's Island, New York Harbor. His career included service in the Philippines, Panama Canal Zone, and as a member of the faculty of the United States Military Academy. He was retired in 1922.

**DEWAR, dû-er, SIR JAMES** (1842-1923). A British chemist (see Vol. VI). In 1915 he published (with G. D. Liveing) *Collected Papers on Spectroscopy*. The Copley Medal of the Royal Society of London was awarded to him in 1916, and the Franklin Medal of the Franklin Institute of Philadelphia in 1919.

**DE WET**, de vêt', CHRISTIAN RUDOLPH (1854-1922). A South African military leader and statesman (see VOL. VI). He was one of the leaders in the rebellion in the South African Union which broke out in 1914. He was defeated at Mushroom Valley by General Botha on Nov. 12, 1914, taken prisoner by Colonel Brits on December 1, and sentenced to a term of six years and to pay a fine of £2000. He was released after one year's imprisonment, however, giving a written promise to take no further part in politics.

**DEWEY**, CHARLES SCHUVELDT (1882- ). An American financial adviser, born at Cadiz, Ohio, who was graduated at Yale (Ph.B., 1904). His early experience in finance was gained in administering the trust estate of his family at Chicago. During the World War, he served in the U. S. Navy as a division officer on the battleship, *Mississippi*. He was vice president of the Northern Trust Company of Chicago, 1920-24, and Assistant Secretary of the U. S. Treasury, 1924-27. Since Nov. 5, 1927 he has been financial adviser to the Republic of Poland and director of the Bank of Poland. For his services in stabilizing Polish currency, he was awarded the Grand Cross with the stars of the Order of Polonia.

**DEWEY**, EVELYN (1889- ). An American educational psychologist, and daughter of John Dewey. She was educated at Barnard College. She is the author of *Schools of To-morrow* (1915), *New Schools for Old* (1919), *Methods and Results of Testing School Children* (1920), and *The Dalton Laboratory Plan* (1922). She was the director of a psychological survey of New York City, 1918-20.

**DEWEY**, HARRY PINNEO (1861- ). An American clergyman, born at Toulon, Ill., and educated at Williams College and Andover Theological Seminary. He was ordained in the Congregational ministry in 1887, and from that year until 1907 served as pastor in various churches. He then became pastor of Plymouth Church, Minneapolis. From 1904 to 1907, he was a director of the Brooklyn Heights Seminary, the Long Island Historical Society, and the Eye and Ear Hospital. He was a member of the National Service Committee of Congregational Churches, 1917-19, and of the National Council Commission on Missions, 1921-27. In 1914 he was made director of the Northeast Neighborhood Settlement House in Minneapolis, and in 1918 of the Pillsbury Settlement House in the same city.

**DEWEY**, JOHN (1859- ). An American philosopher and educator (see VOL. VI). With the death of William James in 1910, Professor Dewey became the leader of the pragmatic school in the United States, and under his direction the emphasis of pragmatism was changed from that of religion and the will to believe to the practical problems of social reconstruction. After the World War, he went on an educational mission to China and Japan. While in Tokyo, he delivered a series of lectures, subsequently published under the title of *Reconstruction in Philosophy* (1902). In 1924 Professor Dewey went on an educational visit to Constantinople, in 1928 he visited Russia and in 1929 delivered the Gifford Lectures at Edinburgh. He was selected as chairman of a League for Independent Action, the nucleus of a new political party, in 1929. A frequent contributor to the *New Republic*, Professor Dewey did not attempt to draw much of a dis-

inction between the immediate exigencies of social action and the more cultural aspects of philosophic inquiry. Both in his *Reconstruction* and in his *Human Nature and Conduct* (1922), we meet with the notion that contemplative ideas (including the mystical belief in a transcendent Deity) are luxuries too great to be indulged in by the modern man because they tend to inhibit his impulses for action. The latter work, moreover, contains a remarkable discussion of the problems of social psychology, with particular emphasis on the much abused topic of instincts. For reasons of social optimism, Professor Dewey rejects the realistic conception of preëxistent determinisms fatally controlling the course of human action; instead, he regards both instincts and habits as existing only from the moment they come into play but with a retroactive power of explanation. Such a solution opens up vistas of critical idealism, perhaps beyond the intentions of the pragmatic philosophy. Professor Dewey's other works after 1914 include: *German Philosophy and Politics* (1915); *Essays in Experimental Logic* (1916); *Democracy and Education* (1916); *Creative Intelligence* (with others, 1917); *Experience and Nature* (1925); *The Public and Its Problems* (1927), and *Characters and Events* (1929). Consult *The Philosophy of John Dewey*, selected and edited by Joseph Rat-  
ned (1928).

**DEWING**, THOMAS WILMER (1851- ). An American figure and portrait painter (see VOL. VI). At the death of Charles L. Freer, in 1919, the Freer collection of Dewing's paintings passed to the National Gallery at Washington, where a room in the Freer Gallery was given over to these works—oil paintings, pastels, silver prints, and screens. A lyric vision, and the exquisite texture of his paintings, evoke about his figures an air of charm and tenderness and mystery.

**DHÈRE**, URBAIN. See BÉRAUD, HENRI.

**D'HERELLE**, FELIX H. (1873- ). A Canadian bacteriologist, born in Montreal. He received his general and medical education in Montreal and Paris and from 1901 to 1908 served as state bacteriologist in Guatemala City and at Merida, Mexico. In 1908 he returned to Paris to enter the Pasteur Institute as a staff member and from 1914 to 1921 was chief of the laboratory. From 1921 to 1923, he held a similar position in the University of Leiden and in 1923-28 he was director of the bacteriological service of the International Sanitary Council of Egypt. In 1928 he became professor of bacteriology at the Yale Medical School. While connected with the Pasteur Institute, he made his remarkable discovery of the bacteriophage, a substance or organism developed in bacteriological cultures which can attack and dissolve the bacteria. His collected writings on this subject were originally published in French, but in 1922 he published a monograph in English with the title *The Bacteriophage* which has gone through several amplified editions, the latest in 1927.

**DIABETES**, di'a-bé'tez. Two radical departures in the treatment of diabetes have been introduced in recent years. The innovations are respectively the Allen fasting treatment and the discovery at the University of Toronto of the organic preparation, insulin, manufactured from the animal pancreas. In contrasting these new resources, it may be stated that the Allen fasting treatment is both curative and able to arrest the progress of the disease when the pancreas

remains able to function. Under favorable circumstances, it is computed that all but about 8 per cent of the patients treated are benefited. The treatment itself is naturally a hardship, as the patient must remain in bed for some weeks, and it cannot be well carried out save in special institutions and under expert care. The field of the insulin treatment is somewhat different. The patient is in an advanced stage of the malady and menaced with death by diabetic acidosis. The injected pancreatic substance makes up for the deficiency of pancreas substance in the body, and so the patient may be kept alive indefinitely as long as he can receive these injections; he may even resume some of his former usefulness. He is not so restricted in his diet as the ordinary diabetic. As in the case of the fasting treatment, the insulin treatment is to be given only by those who are specially instructed, as there is no little danger to the patient from the unskilled use of the remedy.

At first sight, one may think of a paradox in the status of our knowledge of this disease and our ability to control it. Although we are able to control the milder type of case by diet alone and the severe case by the assiduous use of insulin, the disease and incidence mortality have not been correspondingly diminished. This can only mean that the treatment cannot be properly carried out—that to secure results there must be either skilled attendance or the most faithful execution of medical direction by the patient and his friends. One of the most instructive cases on record is that of a young diabetic physician who for nine years by rigid adherence to the Allen dietetic plan kept himself from growing worse; then when insulin was introduced he was able to improve and to lead a normal active life in his profession in addition to marriage and raising a family. When we bear in mind that this patient is not really cured of his disease, the significance of his struggle may be better visualized. See **FOOD AND NUTRITION; DIET; INSULIN.**

**DIAGHILEV, SERGEI** (1872–1929). A Russian producer of ballet. See **BALLET.**

**DIAMONDS.** In no other industry has such excellent control been manifest as in the diamond industry since 1888. During the World War, operations were shut down for one year and in all other periods of depression operations have been curtailed and the danger of overproduction and market demoralization have been avoided. The outstanding feature of the industry in recent years is the tremendous increase in production from the South African alluvial deposits. Following discoveries in the Lichtenberg districts that resulted in an enormous production, diamonds valued at more than £4,000,000 were obtained within six months, under government supervision, from the alluvial fields near the mouth of the Nolloth River, in Namaqualand; in 1929 these were being held by the Union government to be disposed of as the market can absorb them. The continued discovery and development of new alluvial deposits has resulted in a considerable change in the production of diamonds in the Union of South Africa. The 1926 production virtually trebled the previous alluvial production, and brought alluvials to a point where they represented one-quarter of the total production; then 1927 saw another similar increase that brought alluvial production practically on a par with mine production from the standpoint of carats produced, and in value exceeded the mine production.

The output of the diamond mines of the Belgian Congo and Angola have shown a tremendous growth from 23,877 carats in 1914, to 666,290 carats in 1924, and to 1,262,000 carats in 1926. In 1927, however, owing to the heavy productions in South Africa, the output in the Belgian Congo was kept down, but that in Angola showed a considerable increase. Diamonds are being produced in the Gold Coast by several companies, one of which—the African Selection Trust, Ltd.—has estimated their reserves at 9,000,000 carats. New discoveries have been reported at Shinyanga in Tanganyika Territory though production from this region declined in 1928. The thirty-ninth annual report of the DeBeers Consolidated Mines for the year ended June 30, 1927, showed net profit of £1,441,640 as compared with £2,193,430 in the preceding year and net profit of £3,160,630 for the year ended June 30, 1925.

A feature of 1928 was the establishment of a limited diamond-cutting industry at Kimberly in South Africa. Amsterdam and Antwerp continue as the leading markets for the cutting of gems. Brazil supplies the United States with the diamonds required for industrial purposes.

The leading South African diamond producers renewed their interproducers' agreement governing their quotas of sales to the London Diamond Syndicate in 1925. The new agreement is to remain in force for five years and, at the time it was announced, it served to put to an end rumors that were prevalent that disagreement among the producers was threatening to disrupt the organization of the industry. The quotas in the new agreement are unchanged from those previously ruling.

#### DIAMOND PRODUCTION OF THE WORLD From Mineral Industry (In Metric Carats)

	1926	1927
Union of South Africa		
Mines	2,393,784	2,398,681
Alluvial	808,329	2,318,407
Total	3,217,967	4,708,088
Southwest Africa	520,000	500,000 *
Belgian Congo	1,108,000 *	975,000 *
Angola	154,870	201,000 *
Gold Coast	152,148 *	340,020 *
Southern Rhodesia	105	
Tanganyika	6,695	17,168
Brazil	43,198 *	34,018 *
British Guiana	164,156	173,797
Borneo	(c)	(c)
India	(c)	(c)
New South Wales	(c)	(c)
Total	5,374,000	6,950,000

\* Estimated.   <sup>b</sup> Exports.   <sup>c</sup> Figures not available.

**DIAMONDS, ARTIFICIAL.** See **MINERALOGY.**

**DIAZ, dē'áz, ARMANDO** (1861–1928). An Italian soldier who was born at Naples, educated at the Military College of Turin, and who served in the Libyan War (1911–12). He commanded the 49th Division on the Carso front after the entrance of Italy in the World War, and was promoted to commander of the 23d Army Corps which penetrated the Selo line on the Middle Carso in August, 1917. After the disaster of the Caporetto, when the German and Austrian troops broke the Italian line and forced it to retreat to the Piave River, Diaz was appointed commander-in-chief to succeed General Cadorna (Nov. 8, 1917). He made a brilliant defense and established his reputation as one of the greatest generals of the War. By the end of June, 1918, he had forced the enemy east of the Piave, and on October 27, he attacked across the river and was successful all along the line. A week later, Austria surrendered. In 1921 the King

created him Duca della Vittoria, and in the same year he visited the United States. He was Minister of War in the Mussolini cabinet until ill health forced his resignation (1922-24). In the latter year, he was made a Marshal of Italy.

**DIAZ MIRON, SALVADOR** (1853-1928). A Mexican poet, orator, journalist, and statesman, born in Vera Cruz. He was deputy to the Congreso de la Unión, and became nationally known because of his discourse concerning the "English Debt." For years before his death, he was considered the national poet of Mexico. His most notable works are *A Lord Byron*; *El Czar de todas las Rusias*; *¿Qué es poesía?* and *Lo eterno*.

**DIBELIUS, MARTIN** (1883- ). A German theologian and historian born at Dresden. He specialized on the literature and history of primitive Christianity and other religions. He studied at the universities of Neuchâtel, Leipzig, Tübingen, and Berlin and was professor of theology in Berlin from 1910 to 1915, later becoming professor of New Testament theology at Heidelberg. His principal works are *Die Lade Jahwes* (1906); *Die Geisterwelt im Glauben des Paulus* (1909); *Urchristliche Ueberlieferung von Johannes dem Täufer* (1911); *Isisweihe bei Apulejus* (1917); *Formgeschichte der Evangelien* (1919); *Kommentar zum Jakobusbriefe* (1921); *Geschichtliche und übergeschicht Religion im Christentum* (1925).

**DIBELIUS, WILHELM** (1876- ). A German philologist who specializes on English language and literature, born in Berlin. He successively held professorships in Posen, Hamburg, and other cities before retiring to Godesberg on the Rhine. His principal works are *John Copgrave und die englische Schiftsprache* (1899), *Englische Romankunst* (1910), and an exhaustive study of *Charles Dickens* (1916).

**DICK, GEORGE FREDERICK** (1881- ). An American bacteriologist, who with his wife, Gladys Henry Dick, discovered the apparent cause of scarlet fever, a skin test for susceptibility to the disease, a method of immunization against the same, and an antitoxin for its treatment. Dick was born at Fort Wayne, Ind., and received his medical degree from Rush Medical College in 1905. He wrote a few papers on bacteriology under his own name but upon his marriage to Miss Henry all of their efforts were published jointly. Beginning in 1914, they published papers on general subjects but in 1921 devoted all of their attention to scarlet fever, the first paper on this subject appearing in 1921. The research is still in progress. Thus far, they have published no treatise or general summary. While the entire problem of scarlet fever is not yet solved, their work is regarded as of the highest significance for pathology.

**DICK, GLADYS HENRY.** See **DICK, GEORGE FREDERICK**, above.

**DICKINSON, ASA DON** (1876- ). An American librarian and editor, born at Detroit, Mich. He studied at the Columbia University Law School and the State Library School at Albany, N. Y. In the period 1903-12, he was successively connected with the Brooklyn Public Library, Union College Library (Schenectady, N. Y.), Washington State College Library, and others. In 1912-15 and 1916-18, he was on the editorial staff of Doubleday, Page & Co., and later in the war-service department of the American Library Association at Hoboken, N. J., and Paris, France (1918-19). Since 1919 he has been librarian of the University of Pennsylvania.

His work organizing the Punjab libraries for the Indian government was followed by the publication of *Punjab Library Primer*, in 1917. Mr. Dickinson also published *Europe at War* (1914), *The Kaiser* (1914), *One Thousand Best Books* (1924), *Best Books of Our Time* (1928), and several children's publications along a patriotic vein.

**DICKINSON, G(OLDSWORTHY) LOWES** (1862- ). An English writer on history and religious subjects (see Vol. VI). His later works include *An Essay on the Civilization of India, China, and Japan* (1914); *The European Anarchy* (1916); *The Choice Before Us* (1917); *The Magic Flute* (1920); *War: its Nature, Cause, and Cure* (1923), and *The International Anarchy, 1904-14* (1926). The latter, by an analytical review of the ten years before the World War, intends to show that a reform in international intercourse is necessary, and appeals to the younger generation to effect it.

**DICKINSON, HOBART CUTLER** (1875- ). An American physicist, born at Bangor, Me. He was educated at Williams College and later gained the Ph.D. degree at Clark University. During 1900-01 he was assistant at Williams, but in 1903, entered the service of the United States Bureau of Standards, where in 1923 he became chief of the division of heat and power. His original studies have included papers on thermometry, calorimetry, specific heats of liquids, heats of combustion and fusion, thermal properties of refrigerants, thermal conductivities, and internal combustion engines.

**DICKINSON, SIDNEY EDWARD** (1890- ). An American painter, born at Wallingford, Conn., who studied under George Bridgman, William M. Chase, and Douglas Volk. He received the Philadelphia Prize of the Pennsylvania Academy of Fine Arts in 1923, the Popular Prize of the Corcoran Gallery (Washington, D. C.) in 1924, and the Beck Gold Medal of the Pennsylvania Academy in the same year. In 1927 he became a member of the National Academy of Design. He is represented in the Corcoran Gallery, the Art Institute of Chicago, and the City Art Museum of St. Louis.

**DICKINSON, THOMAS H(ERBERT)** (1877- ). An American writer, born at Randolph, Charlotte County, Va. He studied at Ohio State University, Columbia University, and the University of Wisconsin. During the World War, he was a member of the United States Food Administration (1917-18), and the American Relief Administration, Paris and New York (1919-22). He edited *The Play-Book* (1913-15), and several books on the drama. In addition to articles in magazines, he has published *The Case of American Drama* (1915), *Contemporary Drama of England* (1917), *The Insurgent Theatre* (1917), *Russia in the Red Shadow* (1922), *The United States and the League* (1923), *Playwrights of the New American Theatre* (1925), and *An Outline of Contemporary Drama* (1927).

**DICKINSON COLLEGE.** A coeducational institution of higher learning at Carlisle, Pa., founded in 1783. In recent years, by action of the Board of Trustees student enrollment has been limited to approximately 600; in the fall of 1928, registration was 557 and there were 35 members of the faculty. In the same year, productive funds of the college totaled more than \$900,000, and there were more than 40,000 volumes in the library. A new gymnasium, costing \$230,000, was opened in the fall of 1928. President, Marvin Grant Filler, Litt.D.

**DICKSEE, SIR FRANCIS BEENARD (FRANK)** (1853-1928). A British painter who was president of the Royal Academy (1924-1928). He was born in London, educated at the Rev. Mr. G. Henslow's School in that city, and then studied at the Royal Academy (1869), and under Henry Holiday. Being particularly interested in illustration, he started by drawing for magazines and books, and in 1876 he first exhibited at the Academy. In the following year, his "Harmony" was selected as the picture of the year and was purchased by the Chantrey bequest. Dicksee was made an Associate of the Royal Academy in 1881, and was made a full member 10 years later. Aside from his portraits, notably "A Woman in White" (1928), he gained his popularity with romantic representations. Among his best-known pictures are "The Ideal" and "The Two Crowns" which hang in the Tate Gallery, London, and "The Symbol," "The Crisis," "The House Builders," and "A Reverie" in the Walker Art Gallery, Liverpool. His other important pictures include "The Passing of Arthur," "La Belle Dame Sans Merci," "The Funeral of the Viking," and "The Shadowed Face." He was knighted in 1925, received the D.C.L. from Oxford in 1926, and in 1927 was created a Knight Commander of the Royal Victorian Order.

**DICKSON, LEONARD EUGENE** (1874- ). An American mathematician (see VOL. VI). In 1923 he was the winner of the \$1000 prize of the A.A.A.S. for the most important contribution to science. Among his later writings are *Algebraic Invariants* (1915); *Finite Groups* (1916); *History of the Theory of Numbers* (1919); vol. ii, 1920); *Trigonometry with Practical Applications* (1921); *First Course in the Theory of Equations* (1921); *Algebras and Their Arithmetics* (1923); *Modern Algebraic Theories* (1926).

**DICTIONARIES.** See PHILOLOGY, MODERN.

**DIESCH-KAULFUSS, desch-koul'fús, CARL H.** (1880- ). A German librarian, born in Sorau. He studied at the universities of Tübingen and Leipzig and was especially interested in modern literature, the history of the stage, and the Reformation. He is librarian of the state library of Berlin. Among his principal works are *Buch der Reformation* (1917); *Deutsche Dichtung im Strome des Lebens* (1921), and *Bibliographie der germanistischen Zeitschriften* (1927).

**DIESEL ENGINE.** See INTERNAL-COMBUSTION ENGINES; SHIPBUILDING, under *Propelling Machinery*.

**DIET.** The discovery of the vitamins and other advances have added greatly to knowledge of dietetics. It is no longer possible to distinguish between food and drugs, for the end products of protein digestion are closely related chemically to certain active drugs. Some of the amino-acids are known to be stimulants of growth; they agree to this extent with growth-vitamins. The hormones at times present in the diet are of the same nature as those manufactured in the body itself and have the status of drugs. While autointoxication is still imperfectly understood, we know that the action of intestinal bacteria on food can give rise to certain poisonous products, and we can surmise that the behavior known as conjugation, in which the split products of digestion may lose their poisonous properties by uniting with one another, may sometimes fail to take place. A disease may sometimes be controlled by diametrically opposite

plans of diet; everything depends on the individual case. Typhoid fever, often the result of impure and germ-infested drinking water, has often been beneficially treated by semi-starvation; at the other extreme, supposing of course that the digestive processes have not been greatly impaired, equally good results have resulted from stuffing the patient with highly concentrated food. The latter course counteracts the great tendency to lose weight. The dietetic treatment of diabetes was revolutionized, and the application of the Allen fasting treatment has justly been regarded as a great triumph in therapeutics. In this resource, the short fast has been followed by the use of a very light diet slowly increased in nutritive value. The introduction of insulin into the therapeutics of diabetes made possible the use of a more liberal diet.

Acidosis, a form of autointoxication which is not to be confused with intestinal self-poisoning, was shown to play an extraordinary part in the causation of disease. The readiness with which it can now be controlled by diet is one of the greatest recent advances in medicine. The condition develops in actual starvation and in diabetes, in which the carbon of the diet is imperfectly utilized; it may also follow dietetic errors of excess. Acidosis, with its lowering of the normal alkaline reserves of the body, follows on a diet consisting largely of so-called acid-forming foods, some of which have always been regarded as staples. The use of a diet in which alkali formers predominate and even the addition of alkalines to ordinary diet often leads to great improvement.

The beneficial results of the so-called basic diet, from which acid formers are largely omitted, are seen especially in the middle-aged and elderly, and such chronic conditions as high blood pressure and affections usually ascribed to excess of uric acid or slowing up of nutrition with accumulation of waste products in the body, respond remarkably well. In any case of chronic disease or ill health of obscure origin, in which there is reason to suspect the presence of diminished alkaline reserves, the basic diet, which entails no trouble or discomfort, may forestall expensive cures at distant resorts and surgical intervention for the supposed results of focal infection. Important advances in the subject of dietetics are given under ANEMIA, EPILEPSY, and RICKETS, while the subjects of food deficiency and food poisoning are discussed incidentally under BIOCHEMISTRY, BOTULISM, DIABETES, INSULIN, PELLAGRA, SCURVY, SECRETIONS, INTERNAL, TULAREMIA, and VITAMINS. See also FOOD and NUTRITION.

**DIETRICH, JOHN HASSLER** (1878- ). An American clergyman, born at Chambersburg, Pa., and educated at Franklin and Marshall College and at the Reformed Theological seminary at Lancaster, Pa. He was ordained in the ministry of the Reformed Church in 1905, but before this he held various positions, such as private secretary and manager of *Life's Fresh Air Fund*. From 1905 to 1916, he held various pastorates, becoming in the latter year pastor of the First Unitarian Society in Minneapolis. He is the author of *The Gain for Religion in Modern Thought* (1908); *The Religion of a Sceptic* (1911); *Substitutes for the Old Beliefs* (1914); *From Stardust to Soul* (1916); *The Religion of Evolution* (1917); *The Religion of Humanity* (1920); *Do We Need a New Moral Outlook?* (1922); *The Present Crisis*

in *Religion* (1923); *Humanism—a New Faith for a New Age* (1925); *The Humanist Pulpit* (1926); *The Fathers of Evolution* (1927).

**DIEZ**, dēts, JULIUS (1870– ). A German painter who was born in Nuremberg and studied at the Munich Academy and at the Kunstgewerbeschule. He is represented in many galleries, among them the University and German Museum of Munich, and the city halls of Leipsic and Hanover. He received the Grand Prix at Brussels. He was teacher in the School of Arts and Crafts, Munich.

**DIFFENDORFER**, RALPH EUGENE (1879– ). An American clergyman, born at Hayesville, Ohio, and educated at Ohio Wesleyan University, Drew Theological Seminary, and Union Theological Seminary. From 1904 to 1916, he was secretary of the Missionary Education Movement in the United States and Canada. The following year (1916–17), he was educational secretary of the Board of Home Missions and Church Extension and of the Board of Foreign Missions of the Methodist Episcopal Church. He was associate secretary of the Centenary Commission of the Board of Home Missions and Church Extension in 1918, and in 1919–20 served as director of the Home Missions Survey of the Interchurch World Movement. Since 1924 he has been corresponding Secretary of the Methodist Board of Foreign Missions. He is the author of *Child Life in the Mission Lands* (1904); *Junior Studies in the Life of Christ* (1904); *A Modern Disciple of Jesus Christ—David Livingstone* (1913); *Thy Kingdom Come* (1914); *Missionary Education in Home and School* (1917); *The Church and the Community* (1920). He edited *The World Service of the Methodist Episcopal Church* (1923).

**DIKRAN**, KOUYOUMDJIAN. See **ARLEN**, MICHAEL.

**DILL**, LUDWIG (1848– ). A German artist, especially known for his landscapes, who was born in Karlsruhe and studied at the gymnasium and Technische Hochschule in Stuttgart and the Academy of Munich. He was professor of landscape painting at the Karlsruhe Academy of Arts. His work is represented in many European galleries and in the Carnegie Institute at Pittsburgh. He founded the Munich Secession and was a member of the secessions of Berlin, Vienna, and London and honorary member of Fine Arts of Munich. He was decorated by Austria, Bavaria, and Wurtemberg.

**DILLON**, JOHN (1851–1927). An Irish politician (see VOL. VII). In 1918 he succeeded John Redmond as head of the Irish Nationalist Party and was bitter in denouncing England's methods in coercing the Irish. During the World War, he supported British participation and was among those who favored Ireland's participation in the conflict but opposed conscription in Ireland. Failing of election to Parliament in December, 1918, he retired from public life. He criticized the Free State government after its establishment but failed to secure any general support.

**DILNOT**, FRANK (1875– ). An English author and journalist, born in Hampshire. He was educated privately and began as a newspaper reporter in 1900 on the staff of the *Central News*, London which he left two years later for the *Daily Mail* (1902–10). He was editor of the *Daily Citizen*, a British Labor organ (1912–15), and thereafter was a correspondent for the *Chronicle* to investigate social and eco-

nomie conditions in England. In 1918–19, he was president of the Association of Foreign Correspondents in America and in 1919–20, editor of the *Globe*. His publications, the majority of which give evidence of thorough insight into social and economic conditions in England, include: *The Old Order Changeth: the Passing of Power from the House of Lords* (1911), *Lloyd George the Man* (1917), *The New America* (1919), and *England after the War* (1920). His *Lloyd George the Man* had a second edition with three supplementary chapters in 1923 under the title *Lloyd George*. The indiscriminating admiration of the first edition distinctly ebbed in the supplementary chapters.

**DIMNET**, ERNEST (1866– ). A French writer and clergyman, born at Trelon, northern France, and educated at Cambrai, Lille University, where he studied under the poet, Angellier, and at the Sorbonne. For many years he was head of the English department in Collège Stanislas, Paris, during which he made frequent lecture tours in England and the United States. He resigned in 1923. One of his first works, *Figures de Moines* (1908) was crowned by the French Academy and *Les Sœurs Bronë* (1910) received an English translation in 1927. *France Herself Again* (1914); *The Tendencies of French Thought* (1915); *From a Paris Balcony* (1924); and *The Art of Thinking* (1928), were written in English.

**DINGLER**, HUGO ALBERT EMMANUEL HERMANN (1881– ). A German mathematician and physicist, born in Munich and educated at the high school of Aschaffenburg and at the universities of Erlangen, Göttingen, and Munich. He became a member of the faculty of the University of Munich in 1912. His works include: *The Foundations for a Critique of the Exact Sciences* (1907); *The Boundaries and Aims of Science* (1910); *The Bases of Natural Philosophy* (1913); *The Elements of Physics* (1920); *Remarks on the Theory of Relativity* (1921); *Physik und Hypothese* (1921); *Relativitätstheorie und Ökonomieprinzip* (1922); *Das Problem des absoluten Raumes* (1923); *Der Grundgedanke der Mach'schen Philosophie* (1924), and *Der Zusammenbruch der Wissenschaft und der Primatur der Philosophie* (1926).

**DINSMORE**, CHARLES ALLEN (1860– ). An American clergyman and Dante scholar (see VOL. VII). In 1920 Dr. Dinsmore gave up his pastorate at Waterbury, Conn., and became professor of spiritual interpretation of literature at the Yale Divinity School. In 1920 he was Carew lecturer at the Hartford Theological Seminary. His *Life of Dante* was published in 1919. He also wrote *Religious Certitude in an Age of Science* (1924).

**DINWIDDIE**, ALBERT BLEDSOE (1871– ). An American university president, born at Lexington, Ky., and educated at the University of Virginia and the University of Göttingen, Germany. He began his career with a teaching licentiate in the University of Virginia, in 1888, and held various teaching positions, principally in secondary schools, until 1896, when he was appointed professor of mathematics in Southwestern Presbyterian University. In 1906 he was called to Tulane University as assistant professor of applied mathematics and astronomy. He was made associate professor in 1908, full professor in 1910, dean of the College of Arts and Sciences and director of the summer school from 1910 to 1918, and president in 1918. He

was also elected president of the American Association of University Professors, the Louisiana Council of Education, and other educational associations.

**DINWIDDIE**, EDWIN COURTLAND (1867- ). An American temperance advocate (see Vol. VII). He directed the national campaign for the Constitutional Amendment for the prohibition of the liquor traffic in 1917, was president of the International Congress against Alcoholism in 1920-21, and continued active as an officer of numerous temperance organizations.

**DIPHTHERIA**. An important advance in knowledge of this plague is contained in the application of the Schick test to school children, to determine the relative susceptibility or immunity to infection. Many facts have come to light which contradict popular belief. Diphtheria has commonly been regarded as a disease of the tenement population, while scarlet fever was believed to attack both social extremes indifferently. The Schick test shows plainly that the prosperous enjoy no immunity from diphtheria and that the susceptibility to the infection among the well-to-do is about three times as great as among the indigent. This is offset by the recognition among the prosperous of the importance of segregation. The Schick test has shown also that heredity is a factor.

In any case, susceptibility and immunity are not lasting, and tests have to be repeated at comparatively short intervals. Susceptibility is apt to disappear after the age of two or three years. The Negro child is much more susceptible to the disease than some of the whites, e.g., the Italians. Immunization tests are successful in a proportion varying from 70 to 93 per cent. Reports of results of the application of the Schick test vary much with the locality. Diphtheria was responsible for 20,000 deaths annually in the United States. Susceptibility exists in 85 per cent of all children tested.

The campaign of immunization against this disease in the hope of stamping it out has been successful in the localities where it has been earnestly carried out—chiefly suburban and rural; but the great cities have shown indifference and in 1927 four of them accounted for 88 per cent of the national mortality and at the same time the death rate in these cities shows an increase. For some reason not clear, the immunizing campaign has not been carried out in Europe, and even in Germany, the home of antitoxin, and Austria, the birthplace of the Schick test, there is no movement in this direction. It is true that for some years past the disease has not been a menace, but quite recently the medical journals have been stressing the appearance of a deadly type of the disease—fortunately rare—which has resisted the serum treatment. The old claim that this type of disease represents a mixed infection has been disputed by some health officers, who find that it is a pure virulent diphtheria. The belief has gained ground that an affection like diphtheria cannot be understood unless studied in a long perspective—a century at least. Attention has been called to the fact that the doses of antitoxin have steadily increased in size, since the first introduction of serum treatment. This phenomenon may be explained in several ways.

**DISCIPLES OF CHRIST.** The fifth largest Protestant communion in the United States, one branch of which is known as the Churches of Christ, congregational in organization. It seeks to restore the union of the churches through a return to the plan outlined in the New Testament without human additions of creeds and formulas. The number of communicants throughout the world increased from 1,362,711 in 1914 to 1,629,383 in 1928. In the United States, there were 8396 churches in 1916, and 7648 in 1926; with respective memberships of 1,226,028 and 1,377,595. Sunday schools numbered 7549 in 1916, with 942,879 pupils; and 6880 in 1926, with 1,000,416 pupils. In addition to varied types of home mission work among Negroes, Indians, Orientals, Mexican-Americans, and immigrants, foreign missions had extended by 1928 to the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, the Philippine Islands, Porto Rico, Argentina, Paraguay, and Tibet. The six boards which directed all mission work united in 1920 under the title of the United Christian Missionary Society, with headquarters at St. Louis, Mo. The communion maintained in 1928 a total of 512 foreign-mission schools, with an enrollment of 15,621; and there were 5800 baptisms during that year. The 15 hospitals and 21 dispensaries treated 349,577 patients. In the United States, 25 colleges cooperated with the church's board of education, and Bible chairs were maintained in four State universities. The Men and Millions Movement was started in 1913 to secure \$6,300,000 to equip mission stations and increase the endowment of the educational and benevolent institutions of the communion, to enlist 1000 workers for the mission field, and to start "every member" canvasses as the best plan for securing regular offerings for missions. The movement was completed in 1918. During the fiscal year 1928, the churches of the United States and Canada contributed \$4,063,937.86.

**DISEASES OF PLANTS.** See PLANTS, DISEASES OF.

**DITTRICHSTEIN**, LEO (1868-1928). An Austro-American actor-playwright, born in Temesvar, Austria-Hungary. He was educated in Vienna, and made his first appearance with a light opera company in Hungary. He made his New York debut in *Die Ehre*, in 1890. He studied English, and appeared successfully in *Mr. Wilkinson's Widows*, *Trilby*, *Are You a Mason?* *Hedda Gabler*, *Doctor Claudius*, and other plays, as a portrayer of comedy and romantic rôles. He became an American citizen in 1897. Mr. Dittrichstein's greatest success was scored in the play, *The Great Lover*, written by him in collaboration with Frederick and Fanny Hatton, in 1915. He was the author of numerous plays, produced in America and England, among them *Gossip* (with Clyde Fitch, 1895); *A Southern Romance* (1897); *The Last Appeal* (1901); *What's the Matter With Susan?* (1904); *The Ambitious Mrs. Alcott* (1907); *The Million* (from the French, 1911); *The Concert* (1911); *Temperamental Journey* (1912); *The Phantom Rival* (1914).

**DIVISION.** See ARMIES AND ARMY ORGANIZATION.

**DIVORCE.** Since 1914 there has been an extraordinary increase in the number of divorces granted in countries all over the civilized world. There is no question that perhaps the most important single reason contributing to this state of affairs was the new-found freedom of the women. Fundamentalists naturally took alarm; the sanctity of the marriage tie was being threatened. On the other hand, it was possible to demonstrate that persons that received divorces did not stay single for long, but sought other partners in marriage. That is to say, the ease, despite legal obstacles, with which it was possible to obtain divorces merely meant that people were breaking marriage ties because they insisted upon marital happiness. This was something of a gain over the old marriage of convenience, even if it left old-fashioned moralists breathless. While people were getting more divorces, they were also getting more marriage licenses. In 1890 of the total male population in the United States, 34.9 per cent was married; in 1920 the ratio was 41.3 per cent. During the period, the divorce rate had grown tremendously. Divorces have increased from 27,919 in 1887 to 180,853 in 1926; the rate in 1887 was 47 per 100,000 population while in 1926 it had become 152 per 100,000. In 1887, 5.5 divorces took place for every 100 marriages, while in 1926 the ratio was 15 divorces to every 100 marriages.

In 1927 the total number of marriages was 1,200,694, as compared with 1,202,574 in 1926. In 1927 the number of divorces was 192,037, as compared with 180,853 in the previous year. On the basis of population estimates, the number of marriages per 1000 in 1927 was 10.12, as compared with a rate of 10.27 in 1926. In 1927 the divorce rate was 1.62 per 1000, as compared with a rate of 1.52 for the previous year.

The phase of this problem to attract the most public attention was the need for uniformity of legislation. The various States, left to their own resources, had developed a confusing diversity of divorce legislation. In South Carolina, divorce was not allowed; in New Hampshire, there were 14 recognized grounds for a decree. Counting certain duplications, there were in the United States 363 causes for divorce: in one State, New York, unfaithfulness alone; in others, for a variety of reasons down to mere bad temper. The legal complications ensuing on the remarriage of divorced persons were correspondingly abundant and confusing: a marriage legal in one State was bigamous in another, and a child legitimate in one State was illegitimate in another. Naturally, a demand for uniformity was inevitable. The question was agitated along two lines: Federal enactment through a constitutional amendment; and State enactment of a uniform regulatory law. Agitation along Federal lines dates back to 1884, when the first bill was introduced in the lower House for a Federal amendment to the Constitution calling for a uniform marriage-and-divorce law. In recent times, Senator Capper has been sponsoring this type of legislation. His first bill was introduced in 1921; he reintroduced the measure in 1925 and 1927. His proposal calls for Congressional enactment of laws for marriage, divorce, the legitimization of children, and the care of children affected by divorce. The enacting bill called for: 1. A marriage license for marriage. 2. Minimum age for males, 18; for females, 16. 3. No licenses to be granted to

epileptic, feeble-minded, tubercular, or syphilitic persons or to first cousins. 4. Males between 18 and 21 and females between 16 and 18 must have the consent of parents or guardians. 5. Applications for marriage are to be made two weeks before the issuance of the license. 6. The lawful marriage of the father and mother of an illegitimate child shall make it legitimate. 7. Divorce may be decreed upon the following grounds: adultery; cruel and inhuman treatment; abandonment or failure to provide for one year; incurable insanity; conviction of an infamous crime. 8. The final decree may be granted after the lapse of one year only, during which either party may not remarry. 9. All divorce actions must be defended. 10. Alimony may be decreed. 11. In providing for the children, the court shall favor the mother. 12. A divorce decreed in one State shall be recognized in all States. Interestingly enough, the conservatives and the radicals both attacked the Capper Bill. The radical position demanded that collusive divorce be recognized, i.e., where husband and wife both agreed that marriage in their case had proved a failure and should therefore be sundered.

Demands for State action date back to 1879, when the American Bar Association established a committee to consider uniformity. Since that time, there has been established a group known as the Commissioners on Uniform State Laws for the purpose of promoting "uniformity in State laws on all subjects where uniformity is deemed desirable and practicable." This body has been the leading champion of State action and, in fact, has drawn up a series of laws some of which have already been accepted by a number of States. Its Desertion and Non-Support Act has been adopted by 16 States; its Divorce Procedure Act by 2 States; its Annulment of Marriage and Divorce Act by 3 States; its Marriage Evasion Act by 5 States; its Divorce Statistics Act by 1 State; its Marriage Statistics Act by 1 State; its Marriage and Marriage License Act by 2 States; its Migratory Divorce Act by 1 State.

These slow and legal processes have nothing to do with the popular subject of companionate marriage which was widely discussed, beginning with 1927, as a result of a book written by Judge Ben-B. Lindsey. Judge Lindsey's solution for the inadequate marriage-and-divorce codes is a type of marriage under which a childless couple may separate if the marriage has proved uncongenial. Unfortunately, the implications of the term were generally misunderstood, for people began to talk of contracting "companionate marriages" in the same sense that "trial marriages" were once spoken of. At the present time, a marriage is a marriage, regardless of what understanding the parties entering into it may have reached and it may be dissolved only by the lengthy and costly method of divorce. Nowhere in the United States today does the law permit the dissolution of a marriage by collusion and that, in a word, is what most people mean by "companionate marriage."

**Other Countries.** The tendency abroad during the period was markedly toward liberalization of divorce provisions. Spain and Italy (both predominantly Catholic countries), where divorce was not allowed, were in striking contrast. In England, the report of the Royal Divorce Commission, presented in 1912, had recommended an increase of both the causes of

divorce and facilities for divorcement. Although this was steadily opposed by the Church of England and several bills on the subject were defeated during the period, in 1923 a measure was got through by which the terms for a decree, infidelity, were at least made identical for men and women (previously, for women, cruelty or desertion as well as infidelity had been necessary). The prohibitive cost of divorce in England had been somewhat eased by a Poor Person's Act, under which, if an individual did not object to be so classed, a decree might be obtained at a cheaper rate; but up to 1924, only one divorce court (in London) had been established and this condition added greatly to the expense of securing a decree. On the Continent, there was an unmistakable drift toward the adoption of mutual desire as a reason for the dissolution of marriage. In Austria and Russia, this had been legal for Jews; in Holland, the principle was evident in a provision for divorce after five years of judicial separation; Belgium recognized as grounds "mutual and unwavering consent"; and in Portugal and Rumania, mutual consent was accepted, subject to provisions. The new German, Austrian, and Russian legislation on the subject, in adopting mutual consent as a cause, endeavored specifically to provide against an irresponsible attitude toward children or wife. The Scandinavian experiment was most noteworthy. As a result of a comprehensive study of Scandinavian social legislation, 1910-18, divorce legislation was adopted in Sweden in 1915, in Norway in 1918, and in Denmark in 1922, which definitely recognized mutual consent as the fundamental reason for the dissolution of marriage. Separation for a year, however, was required before the granting of the decree. Both parents were required to contribute to the support of children. The question of custody was left to be settled by the parents where possible and where there was involved no danger to the welfare of the child. For cases where divorce was desired by only one party, the grounds were liberal, including such as flagrant neglect, misuse of intoxicants, etc.

**DIX, KURT WALTHER** (1878- ). A German pedagogogue and writer on subjects of education, born in Greiz. He studied at the universities of Dresden and Jena and has devoted himself to teaching and studying child psychology, child hygiene, etc. Among his works are *Erziehung und Nervosität im Kindesalter* (1909); *Körperliche und geistige Entwicklung eines Kindes* (1911-12); *Kindeskunde* (1911); *Entwicklung der Denkkraft* (1921); *Gemütsleben in der frühen Kindheit* (1923); and *Die Reifezeit* (1927).

**DIXON, AMZI CLARENCE** (1854-1925). An American clergyman and author (see Vol. VII). From 1922 to his death, he was pastor of the University Baptist Church, Baltimore, Md. His later works include: *Reconstruction* (1919); *The Birth of Christ, the Incarnation of God* (1919); *Why I am a Christian* (1921); *Higher Critic Myths and Moths* (1921).

**DIXON, JAMES MAIN** (1856- ). An American teacher and author (see Vol. VII). In 1920 he wrote *The Spiritual Meaning of Tennyson's "In Memoriam"* and *Manual of Modern Scots*.

**DIXON, JOSEPH MOORE** (1867- ). An American public official (see Vol. VII). He was Governor of Montana for the term 1921-25. In

1920 he was appointed an Assistant Secretary of the Interior.

**DIXON, ROLAND BURRAGE** (1875- ). An American anthropologist (see Vol. VII). He was professor at Harvard after 1916 and member of the American Commission to Negotiate Peace (1916-18) in Paris. He is a contributor to anthropological and ethnological journals and his most recent works include *Oceanic Mythology* (Myths of the Idonesian, Oceanian, Australian region, published in 1915), *The Racial History of Man* (1923), and *The Building of Cultures* (1928).

**DIXON, ROYAL** (1885- ). An American author, born at Huntsville, Tex., and educated at the Sam Houston Normal Institute and as a special student at the University of Chicago. After spending five years with the department of botany at the Field Museum of Chicago, he entered the literary field as a member of the *Houston Chronicle* staff. He has been a special contributor to the leading newspapers of New York, where he has lectured for the Board of Education. His interest and attention have been directed to immigration. His works include *The Human Side of Plants* (1914); *Americanization* (1916); *The Human Side of Animals* (1918); *Hidden Children* (1922); *Personality of Plants* (1923); *Pharaoh's Bird* (1927).

**DIXON, THOMAS** (1864- ). An American novelist and playwright (see Vol. VII). His photoplay, *The Birth of a Nation*, appeared in 1915, and he published *Fall of a Nation* (1916), *The Way of a Man* (1918), *A Man of the People* (1920), *The Man in Gray* (1921), *The Black Hood* (1924), and *The Love Complex* (1925).

**DJEMAL PASHA, jëm'el pā-shā, (AHMED DJEMAL)** (1873-1922). A Turkish soldier and politician, born at Constantinople. After a French education, he entered the Turkish Army, and soon became lieutenant colonel. He was a major in the Young Turk movement (1908), and in 1911, he was made governor of Bagdad, and shortly after, Vali of Constantinople. About this time, he resigned his military command and devoted himself to politics, becoming Minister of Public Works (1913), and Minister of Marine (1914). These political activities brought upon him the personal antagonism of Enver Pasha. This and his pro-French attitude caused him to be sent to Syria as commander-in-chief of the 4th Army in 1914. Upon being recalled in 1917, he was made commander-in-chief of all the troops except those at the Sinai front, an exception which led to friction. As a result Djemal abandoned military operations, returned to Constantinople, and resumed his duties as Minister of Marine, but opportunities for power did not come his way. In 1918 he fled from Turkey, and in 1919 was condemned to death by a Turkish court martial. He tried to bring about an understanding between Soviet Russia and the Turkish Nationalists. He became military advisor to the Amir of Afghanistan, and was murdered in Tiflis when on business for the Afghan Army.

**DOBRUDJA.** See BULGARIA; RUMANIA.

**DOCKS.** While the U. S. Navy authorities have long recognized the fact that suitable dry docks, or graving docks, as they are sometimes called, are essential in any scheme of naval preparedness, it would seem that the low status of the American merchant marine had led to a

neglect of such facilities in the United States prior to the World War. Indeed it is said that when the United States actively joined the Allies in the War and took over for transport service the former German liner, the *Vaterland*, renamed *Leviathan*, there was no drydock in the United States large enough for that vessel. One of the most important of the existing docks was the Brooklyn Navy Yard Dock at New York. This structure, with a usable length of 700 feet, with a width of 110 feet at the keel blocks and with a depth over the sill of 36 feet, was authorized in 1900 but not completed until 1912. It was a most difficult piece of construction on a bottom of quicksand. The first contractor came to grief in 1908; the second lasted but one year; the third contract involved both a changed design and increased dimensions.

Apparently, the needs of the American Navy and shipping at the time of the World War stimulated the development of dock facilities in the United States, and a number of important docks have since been built.

**Norfolk Navy Yard Drydock.** The United States Navy Yard at Portsmouth, Va., had its facilities increased by the construction of a drydock 1011 feet long, 144 feet wide at the coping, and 40 feet deep, which was opened in April, 1919, after having been under construction since February, 1917. This work involved the excavation of 625,000 cubic yards and the placing of a total yardage of concrete of 185,000. The Norfolk Navy Yard also contained two drydocks, built through the cooperation and financial assistance of the United States Shipping Board during the War, which were completed in 1919 and formally inaugurated on October 31, of that year, by the Queen of the Belgians.

**Commonwealth Drydock.** In 1915 active work was begun on a large drydock at South Boston built by the Commonwealth of Massachusetts which was an important element in the port and harbor development of Boston. This dock at the time of its completion was the largest in the United States, being 1176 feet long and 149 feet, 9 inches wide. It could take care of a ship of 1150 feet in length with a beam of 115 feet and 45 feet draft. It had a capacity of 55,000,000 gallons, and was unwatered by three electric pumps, requiring about two hours for the operation. This dock cost the Commonwealth of Massachusetts over \$3,000,000, and was purchased by the United States Government under authority from Congress for \$4,100,000, being formally taken over by the United States Navy and put in commission on Dec. 22, 1919, the battleship *Virginia* being the first vessel to use the dock.

**Pearl Harbor Drydock.** As early as 1908, the United States Navy began the construction of a drydock at Pearl Harbor, Hawaiian Islands, which was completed and flooded on Aug. 21, 1919. The plans for developing a small naval station located at this point involved the construction of a graving dock 589 feet long, but with the completion of the Panama Canal and the increased size of ships navigating the Pacific Ocean, it was determined to increase its dimensions. Accordingly, the dock was built, 1022 feet long 138 feet wide at the coping, and 39½ feet in effective depth, there being 43½ feet depth from top of coping to floor. This gave a clear water basin 1010 feet long and 1010 feet wide at the bottom clearance. In 1913 a seismic disturbance caused the collapse

of the work under way, and after a technical investigation a modified plan of construction was adopted in 1915, and finished in 1919. A full report of this drydock, the history of its early construction, as well as the adoption of the new design, is contained in the *Transactions of the American Society of Civil Engineers*, vol. lxx, page 223, 1916.

**Balboa Drydock.** In 1916 the new drydock at Balboa, at the Pacific terminal of the Panama Canal zone, was completed with a length of 1000 feet, a width of 110 feet, and a depth of 35 feet over the blocks at mean tide. This structure was one of the important works connected with the shipping facilities of the Panama Canal, and made possible the docking and repair of steamers of considerable size.

**St. John, N. B., Drydock.** The St. John Drydock and Shipbuilding Company in November, 1923, opened its new drydock at St. John, N. B. This new dock was the largest of its kind in the world, having an extreme length of 1225 feet and length over the blocks of 1150 feet. It was so arranged that it could be used in two independent sections, one 650 feet long and the other 500 feet long. There was a patent slipway 720 feet in length and a cradle 240 feet long. The depth over the sill at high tide was 42 feet. The dock was provided with a 70-ton fixed crane and a 20-ton traveling crane.

**Drydock at Quebec.** The Champlain drydock at Quebec, which had been under construction since 1914, was completed in August, 1918. Situated on the south side of the St. Lawrence, and with a length of 1150 feet, a width of 120 feet and depth over the sill of 34 feet at neap tide, and 40 feet at high water at spring tide, it was at the time of its completion one of the largest drydocks in the world, being able to accommodate the largest ships for which the port of Quebec had adequate deep-water berths. This dock was divided into two compartments, with an inner chamber 650 feet in length and an outer one 500 feet in length, the latter being closed by a rolling caisson, while the middle entrance was formed by a floating caisson. For emptying the dock, three main pumps of the horizontal centrifugal type, designed to deliver 63,000 gallons a minute against the total head of 25 feet, were provided. These were operated by electric power and could empty the dock in about two and a half hours.

**American-built Docks in France.** At the mouth of the Loire River in France, during the War, engineers of the American Army constructed a notable timber dock system which provided new berths for 10 vessels in addition to an existing series of docks adjoining, previously constructed by the French. These docks were built of timber supported by wooden piles and were located on mud flats. On their shore side were built long low classification sheds, and further inland a receiving yard, and a departure yard for the handling of freight cars. There was provided specially designed timber rigging for the handling of ships' cargoes, and heavy steel gantry cranes were erected also.

**Floating Docks.** In the period after 1914, there was also an increase in the size and capacity of floating docks which, it will be recalled, could be used at any convenient location, and could be moved from place to place if so desired. At the close of the War, two large floating docks owned by Germany and, at the time, the largest structures of the kind, passed

into the possession of the British. Each of these had an overall length of about 700 feet and a lift of some 40,000 tons. The British Admiralty, however, decided that there was need of a still larger floating dock, and in November, 1922, one was put under construction with a length of 960 feet, and a lifting capacity of 60,000 tons. This was built at the Walker Shipyard of Sir W. G. Armstrong, Whitworth & Co., and was designed for the port of Southampton. This dock which, at the time of its completion, in 1924, was the world's largest floating dock, was of the double-sided, self-docking sectional box type, and consisted of pontoon and two parallel walls divided transversely by seven sections. When in position at Southampton, it was moored by four steel booms 110 feet long, hinged at one end to the dock and at the other extremity to four dolphins of reinforced concrete. When submerged, the dock contains some 80,000 tons of water, to pump out which, 14 motor-driven centrifugal pumps were provided and with all in operation some four hours were required to remove the water. The British Government accordingly had, with the Southampton and the two German docks, three floating docks, each of which was capable of taking a large battleship, such as the *Hood*, and a distinct strategic and maintenance advantage was gained by the fact that all of these docks could be passed through the Suez Canal.

**Bibliography.** Such special constructions as drydocks are generally described only in the more technical publications, such as are published by the engineering societies. In ordinary dock work, few structural improvements or changes have been noted in recent years. Reinforced concrete has of course been widely used, although the older timber construction still holds its important position in such work. On the other hand, important developments have occurred in the application of machinery to dock work in connection with loading, unloading, storing, and shipping. A recent work of interest on these facilities in general is Carleton Greene, *Wharves and Piers* (New York).

**DODD, LEE WILSON** (1879- ). An American author and playwright, born at Franklin, Pa., and educated at Yale. He studied law at the New York Law School and was admitted to the bar in 1902, but gave up law five years later for literature, in which he made distinct accomplishment, but has been criticized as being over novelistic. He is the author of *A Modern Alchemist* (1906); *The Return of Eve* (1909); *Speed* (1911); *The Middle Miles* (1915); *His Majesty Bunker Bean* (1915); *Pals First*; *The Book of Susan* (1920); *Lilia Chenoworth* (1922); *The Girl Next Door* (1923); *The Changclings* (play, 1923); *The Sly Giraffe* (for children, 1923); *The Golden Complex* (1927); *The Great Enlightenment* (verse, 1928).

**DODD, WILLIAM EDWARD** (1869- ). An American historian, born at Clayton, N. C., and educated at Virginia Polytechnical Institute and the University of Leipzig. While successively holding the chairs of history at Randolph-Macon College (1900-08) and at the University of Chicago (1908- ), he wrote *Jeffersons Rückkehr zur Politik, 1796* (1900); *Life of Nathaniel Macon* (1903); *Life of Jefferson Davis* (1907); *Statesmen of the Old South* (1911); *The Cotton Kingdom* (Chronicles of America series, 1919); *Woodrow Wilson and His Work* (1920); and *Lincoln or Lee* (1928). In ad-

dition, he was editor and joint author of the *Riverside History of the United States* (1915) joint editor, with Ray Stannard Baker, of *The Public Papers of Woodrow Wilson* (1924-26); and co-translator of Lamprecht's *What Is History?* (1905).

**DODDS, EDWARD CHARLES** (1899- ). A British physician, biochemist, and chemical pathologist. He was educated at Harrow and the Middlesex Hospital Medical School, where at first he served as student demonstrator in biochemistry. Later, he was made professor of biochemistry in the University of London and held the title of chemical pathologist to several prominent hospitals. When the philanthropist, Courtauld, established a special research institute for Dodds at the Middlesex Hospital Medical School, he returned to that institution as Courtauld Professor of biochemistry. He has collaborated in two books, *Recent Advances in Medicine* (with G. E. Beaumont) and *The Chemical and Physiological Properties of the Internal Secretions* (with F. C. Dickens). One of his notable achievements has been a large-scale method of manufacturing insulin at reduced cost. He was summoned in consultation at the illness of His Majesty, George V, in 1928-29, partly as a result of his study of the action of calcium on the blood.

**DODECANESE.** A group of 12 small islands, the Sporades, off the southwest coast of Asia Minor, among which, politically, Rhodes was included. Most of them, barren rocks, are uninhabited. Of their total population, 100,198 in 1917, the greater part were Greek sponge fishermen inhabiting Rhodes and Cos. During the Libyan War between Italy and Turkey, the Italians occupied the islands, and by the Treaty of Lausanne of 1912, Italy was permitted to continue occupation only as a guarantee toward Turkish evacuation of Tripoli. The Turks claimed to have fulfilled their obligations, but the Italians stayed on. In 1919 the Greek Premier, Venizelos, effected a bargain with Tittoni, Italian Foreign Minister, by which the Dodecanese were to be turned over to Greece and Rhodes to Italy. The disposition of the latter the Italians promised to submit to a plebiscite when Great Britain should promise to do similarly in the case of Cyprus. The Peace Treaty of Sèvres in 1920 transferred the islands from Turkish to Italian sovereignty, while the separate Greco-Italian Treaty signed on the same day, in accordance with the Venizelos-Tittoni agreement, promised all except Rhodes, where a plebiscite was to be held, to Greece. Despite this pledge, Italy continued in occupation of the disputed territory, and shortly afterward repudiated the agreement, on the ground that the Sèvres Treaty had not been ratified. The overthrow of Venizelos, the defeat of Greece in its Asia Minor adventure, and the rise of Italian chauvinism under Mussolini, gave substance to the belief that Venizelos's settlement was only too ephemeral and that Italy rather than Greece was to control the eastern Mediterranean. The soundness of these conjectures was confirmed when, regardless of self-determination and the principle of nationalism, and in a spirit typical of the old diplomacy, the Great Powers in 1923 confirmed Italy's hold on the islands. By article 25 of the Treaty of Lausanne, Turkey renounced all rights over the Dodecanese, Rhodes, and the island of Castellorizzo in favor of Italy. No

mention was made in the treaty of the promised pelibiscite. See GREECE; ITALY.

**DODGE, RAYMOND** (1871- ). An American experimental psychologist. He was educated at Williams College and the University of Halle (Germany). In 1896 he was appointed professor of philosophy at Ursinus College, and the following year became associated with Wesleyan University, where he was full professor 1902-24. Since 1924 he has been professor in the Institute of Psychology at Yale. He was selected to conduct experiments on the psychology of nutrition at the Carnegie Institute laboratory (1913-14), and also the psychological effects of alcohol (1915). He became the editor of the *Journal of Experimental Psychology* (1916) and of the *Journal of Comparative Psychology* (1921). He is the author of numerous scientific monographs and papers on the psychology of language, vision, eye movement, and dynamic psychology in general.

**DODGE, WILLIAM DE LEFTWICH** (1867- ). An American artist born at Liberty, Va., who studied in Paris and Munich and entered first place in the examination for the École des Beaux Arts. Mr. Dodge's work as a mural painter is represented in New York by his decorations of the Empire Theatre, of the Waldorf-Astoria Hotel, and of other theatres and hotels. Among his principal works were the decorations of the Café de l'Opéra, Paris, The Folies Bergères Theatre, murals for the Panama-Pacific International Exposition, and for the Flag Room in the capitol at Albany, "Mosaics for the Hall of Records, New York, "Signing of the Peace," at Versailles, and "Taking of the Fort de Vaux." He was chief of color for the Sesquicentennial Exposition at Philadelphia in 1926.

**DOFFLEIN, FRANZ J. T.** (1873- ). A German zoölogist born in Paris. He traveled extensively in the United States, West Indies, and Mexico. He succeeded Weismann as professor of zoölogy at the University of Munich, in 1912, and became professor at Breslau in 1918. Professor Dofflein's published works were on the protozoa, animal biology, and psychology.

**DOHENY, EDWARD LAURENCE** (1856- ). An American capitalist and oil producer, born at Fond du Lac, Wis., who spent his early years prospecting for gold with varying success. Stranded in Los Angeles in 1892, he noticed a wagonload of pitch passing along the street and investigated the hole from which it was taken. He obtained a lease of a lot nearby, and at 225 feet struck a gusher which started the Los Angeles oil field. After finding several other fields and gaining several fortunes, he went to Mexico in 1900 and organized the Mexican Petroleum Company with \$10,000,000 capital, and obtained leases on about 1,000,000 acres of barren land near Tampico. In four or five years, Tampico was a world oil centre. The control of such vast enterprises inevitably led Doheny into political activity. In Mexico, he was charged with being responsible for several revolutions, and he was a large factor in California politics. He was prominent in the transactions in regard to the United States naval oil reserves, and was called to Washington to testify before the investigating committee early in 1924. His testimony revealed that he had lent \$100,000 to former Secretary of the Interior Albert B. Fall, and that a number of ex-cabinet

members and other government officials had been employed by him in connection with the oil leases. The Government's suit against Doheny for cancellation of the lease on naval oil reserve No. 1 at Elk Hills, Calif., was decided in the Federal District Court in June, 1925, in favor of the Government. This was affirmed by the U. S. Supreme Court in 1927.

**DOHERTY, PHILIP JOSEPH** (1856- ). An American lawyer, born at Charlestown, Mass., and educated at the School of Law, Boston University. He practiced in Boston from 1877 to 1908; in the latter year becoming attorney to the division of safety of the Interstate Commerce Commission and, in 1913, chief attorney. Beginning in 1884, he held various political offices, including membership in the Massachusetts House of Representatives. In 1909 he served as special assistant to the Attorney General in the Mondou-N. Y. N. H. & H. R. R. case, involving the constitutionality of the Federal Railway Employers' Liability Act. In 1914 he was on the commission to investigate the finances of the New Haven Railroad. In 1918 he was appointed manager of the property-protection section of the United States Railroad Administration and, the following year, became attorney to the valuation bureau of the Interstate Commerce Commission. He is the author of *The Liability of Railroads to Interstate Employees* (1911).

**DOHNANYI, ERNST VON** (1877- ). A Hungarian pianist and composer, born in Pressburg (see VOL. VII). From 1905 to 1915, he was professor of piano at the Königliche Hochschule für Musik in Berlin, then accepted a similar position at the Hochschule in Budapest, and in 1919 became director. After a few months, he resigned this post to become president of the Philharmonic Society. Since 1920 he has made several pianistic tours of the United States, and in 1925 also appeared as conductor of the State Symphony Orchestra in New York. He added to his works the operas *Tante Simona* (Dresden, 1912), *Der Turm des Wojewoden* (Budapest, 1922; as *Ica's Trum*, Düsseldorf, 1926), *Der Tenor* (Budapest, 1929); two symphonies (F and D minor); *Festouvertüre* for triple orchestra; *Ruralia Hungarica*; a piano concerto in E minor; a violin concerto in D; and considerable chamber music of more than ordinary merit.

**DOHSE, dös, RICHARD** (1875- ). A German historian, born at Lubz, Mecklenburg. He studied at the universities of Munich, Marburg, Geneva, and Rostock, specializing on modern languages and history. He traveled in France and Spain and was journalist, correspondent, and editor of various papers. His principal works are *Colley Cibbers Bearbeitung von Shakespeares Richard III* (1897); a volume of verse, *Aus stillen Stunden* (1902); *Kunst für die Jugend* (1902); several books of verse in Low German (1902-14); *Moderne deutsche Literatur* (1920); *Deutsche Literatur von Anfang bis Hebbel* (1921); and *Das Niederdeutsche Drama* (1921); *Gustav Kohns, sein Wesen und sein Werk* (1927), and biographies of *Fritz Reuter*, *Wilhelm Holzamer*, and *Fritz Stavenhagen*.

**DOLMETSCH, ARNOLD** (1858- ). A famous British connoisseur of old instruments, born at Le Mans, France. While working as an apprentice in his father's piano factory, he showed such talent for the violin that he was sent to Vieuxtemps in Brussels. After further

study at the Royal College of Music in London, he taught violin at Dulwich College. Becoming the possessor of a viola d'amore, he immediately made himself master not only of that instrument, but of every member of the viol family, and began to collect and repair old instruments. With his wife and a pupil, Kathleen Salmon, he formed a trio, with which he gave recitals of early music written for the old instruments. A tour of the United States, in 1902, attracted so much attention, that Chickering & Sons of Boston placed their factory and a number of their best workmen at his disposal. There he remained until 1909, restoring old spinets, harpsichords, etc. and giving numerous recitals on these instruments. He then continued the same occupation in Paris, where the factory of Gaveau was at his disposal. In 1914 he settled in London and established his own factory at Haslemere, Surrey. With his wife and four children he gave, in 1925, in Haslemere a festival of older music with such success that the Haslemere Festival has become an annual event. In 1928 the Dolmetsch Foundation was established to insure the perpetuation of the festival. Dolmetsch edited two volumes of works of English composers of the sixteenth and seventeenth centuries (1912) and wrote an important book: *The Interpretation of the Music of the Seventeenth and Eighteenth Centuries* (1915).

**DOMBROWSKI**, döm-brôf'skê. ERICH FRANZ (1882- ). A German student of theoretical and practical economy, born in Danzig. He became a well known traveler and editor, and a lecturer at Danzig, Kiel, Berlin, and Leipzig. He wrote *Zehn Jahre deutscher Kulturentwicklung vor dem Kriege* (1915); *Das alte und neue System* (1919); and more recently *Politische Köpfe Deutschlands* (1920); and *Die Männer der Übergangszeit, Köpfe der Gegenwart, Neue Köpfe* (1925).

**DOMINIAN**, LEON (1880- ). An American geographer, born at Constantinople, Turkey. He was graduated at Robert College in 1898 and during 1898-1900 studied at Liège. After traveling in Turkey and Mexico, he served as assistant to the U. S. Geological Survey, instructor in the New Mexico School of Mines, and special writer for the *National Geographic Magazine*. He became connected with the Department of State in 1918, serving it on various technical matters, especially with the American Peace Conference in France during 1919. Since 1921 he has been United States Consul in Rome. He served as a delegate to the 12th International Geographical Congress in Toronto in 1913 and to the 2d Pan-American Scientific Congress held in Washington in 1915. He is the author of *The Frontiers of Language and Nationality in Europe* (1917).

**DOMINICAN REPUBLIC**. See SANTO DOMINGO.

**DONNAY**, dô'nê', MAURICE (1859- ). A French dramatic author (see Vol. VII), whose recent work includes: *Alfred de Musset* (1914); *La Parisienne et la guerre* (1916); *L'Impromptu du paquebot* (1916); *Le Théâtre aux armées* (1916); *Premières impressions* (1917); *Lettres à une dame Blanche* (1917); *Pendant qu'ils sont à Noyon* (1917); *La Chasse à l'homme* (1919); *Dialogues d'hier* (1920); *Sous le sourire d'Elisabeth*, essays (1924); *La vie amoureuse d'Alfred de Musset* (1926), and *Autour du Chat Noir*, miscellaneous (1926).

By 1927 his series, issued under the title *Théâtre Complet*, had reached eight volumes.

**DORGELES**, dôr-zhêl, ROLAND (1886- ). A French novelist, who came to the front with the publication of his war novels, *Les Croix de Bois* (1918) and *Le Cabaret de la Belle Femme* (1921). In spite of the intensity of his subject, his style was that of a sober realism, which was in many ways the equal of the melodramatic pages of Barbusse's *Under Fire*. His other works include *La Machine à finir la guerre* (in collaboration with Régis Gignoux, 1916); *La Boule de qui* (1921); *Saint-Magloire* (1921); *Sous les Ailes de mon moulin* (1922); *Le Réveil des morts* (1923); *On the Mandarin Road*, travel in Indo-China (1924); *Partir* (1924); and *La Caravane Sans Chameaux* (1928). *Les Croix de Bois*, *Saint-Magloire*, and *Partir* were translated into English. Dorgelès received the Prix Femina for 1918 and 1919.

**DORR**, RHETA CHILDE (?- ). An American author and social worker (see Vol. VII). She was war correspondent for a syndicate of 21 newspapers during 1917-18, and was foreign correspondent with headquarters at Prague in 1920-23. Her later books include *Inside the Russian Revolution* (1917), *The Soldier's Mother in France* (1918), *Czechoslovakia* (1921), *A Woman of Fifty* (1924), and *Susan B. Anthony* (1928).

**DORSEY**, GEORGE AMOS (1868- ). An American anthropologist and author (See Vol. VII). Dr. Dorsey severed his connection with the Field Museum of Natural History, Chicago, and the University of Chicago in 1915. He served in the United States Navy in 1918-21 as lieutenant and lieutenant commander, was assistant naval attaché at Madrid in 1918, and naval attaché at Lisbon in 1919-21. He was also adviser on Spanish problems to the American Commission to Negotiate Peace at Paris in 1919. Since 1925 he has lectured on anthropology at the New School for Social Research in New York. He is the author of *Young Low* (a novel, 1917); *Why We Behave Like Human Beings* (1925); *The Nature of Man* (1927); *The Evolution of Charles Darwin* (1927); and various anthropological researches published by the Field Museum of Natural History.

**DORSEY**, N (OAK) ERNEST (1873- ). An American physicist, born at Annapolis Junction, Md. He was graduated in 1893 from Johns Hopkins, where he was a fellow during 1896-97 and received his Ph.D. After serving as a research fellow at the Yerkes Observatory during 1899, he returned to Johns Hopkins and was an associate in physics until 1901, when he entered the service of the Government as physicist to the Bureau of Soils in the Department of Agriculture. In 1903 he transferred to the Bureau of Standards, in which he attained the rank of physicist in 1917. In 1921 he assumed a consulting relation with the Bureau in addition to his private practice. His principal investigations have included the physics of the soil, absolute measurement in electricity and physics of the medical sciences, including applications of X-rays. Besides many articles contributed to scientific journals, he is the author of *Physics or Radioactivity* (1921).

**DOTTIN**, HENRI GEORGES (1863-1928). A French philologist (see Vol. VII), who became a correspondent of the Institut de France in 1919, and edited the *Revue Celtique*. His later works were *Les anciens peuples de l'Europe*

(1916); *La langue gauloise* (1920); *Les Littératures Celtiques* (1924), and *L'épopée irlandaise* (1925).

**DOUGALL, LILY** (1858-1923). A Canadian novelist (see VOL VII). Among her recent works are *The Practice of Christianity* (1914), and *The Christian Doctrine of Health* (1916). She was part author of *Concerning Prayer* (1916); *Immortality* (1917); *The Spirit* (1919); *God and the Struggle for Existence* (1919); *Arctades Ambo* (1919), a volume of poems, and *The Lord of Thought* (1922).

**DOUGHERTY, PAUL** (1877- ). An American marine painter, born in Brooklyn, N. Y. He was graduated from the Brooklyn Polytechnic Institute and the New York Law School and studied art in Europe, spending much of his time in London, Paris, Florence, Venice, and Munich. In 1906 he was elected an associate of the National Academy and the next year he was made a full member. He is also a member of the National Institute of Arts and Letters. Mr. Dougherty's marine paintings have been exhibited all over the United States and in many parts of Europe and include: "October Seas"; "The Road to Cayey"; "Lake Louise" (Metropolitan Museum, N. Y.); "Sun and Storm" (National Gallery, Washington); "Flood Tide" (Carnegie Institute, Pittsburgh); "Storm Quiet" (Chicago Art Institute); "The Land and the Sea" (Corcoran Gallery, Washington); "Autumn Oaks" (Brooklyn Institute Museum). Among Mr. Dougherty's awards was the gold medal from the Panama-Pacific International Exposition in 1915.

**DOUGHTY, DO'U or DOU'TI, ARTHUR GEORGE** (1860- ). A Canadian historian (see VOL VII). In 1917 Doughty was attached to the Canadian Expeditionary Force War Archives Survey and in 1919 he accompanied the Prince of Wales as historian on his Canadian tour. He was a member of the Canadian delegation to the Imperial Conferences of 1923 and 1926. Among his later works appear *The Acadian Exiles* (1915), *A Daughter of New France* (1916), and *Notes on the History of Canada Prepared for the Visit of the Prince of Wales* (1919).

**DOUGHTY, CHARLES MONTAGUE** (1843-1926). An English explorer and author (see VOL VII). His later work was devoted almost entirely to the writing of poetry and poetic drama. *The Titans* appeared in 1916 and *Man-soul, or the Riddle of the World* in 1920. Consult *The Life of Charles M. Doughty*, by D. G. Hogarth (1928).

**DOUGHTY, HOWARD WATERS** (1871- ). An American chemist, born at Baltimore, Md. He was educated at Johns Hopkins University, where he received his Ph.D. in 1905. During 1905-06, he was instructor of chemistry at Missouri and during 1907-08, at Wisconsin, after which he went to Amherst, where he became full professor in 1913. His original investigations have been chiefly in the field of organic chemistry, notably on derivatives of trimethylparaconic and camphoronic acids and on the reactions with various metals of compounds containing the trihalogen methyl group.

**DOUGLAS, DŪGLAS, ROBERT LANGTON** (1864- ). An English art critic, lecturer, and author (see VOL VII). He served in the World War as staff captain at the War Office (1916-17) and was director of the National Gallery, Ireland (1916-23). To the literature of Siennese art, as an authority on which he was best

known, he contributed in 1914 an edition (second) of *Histoire de Sienne*.

**DOUMER, dōō'mē', PAUL** (1857- ). A French statesman (see VOL VII). He was elected to the Senate in 1912, opposed the policies of Briand's war cabinet, and entered that of Painlevé as Minister without Portfolio (1917). In Briand's cabinets of 1921-22 and 1925-26, he was Finance Minister, and in 1927 he was made president of the Senate.

**DOUMERGUE, dōō'mērg', GASTON** (1863- ). A French statesman (see VOL VII). He held the portfolio for the colonies through the ministries of Viviani and Briand (1914-March, 1917), when he was sent to Russia to persuade the Kerensky government not to make a separate peace with Germany and Austria. He was president of the Senate in 1923 and 1924, until his election as twelfth President of France on June 13, 1924. He was the first Protestant and the first bachelor to hold that office.

**DOUMIC, dōō'mēk', RENÉ** (1860- ). A French literary and dramatic critic (see VOL VII), editor of the *Revue des Deux Mondes* (1916- ) and permanent secretary of the French Academy (1923- ). His later works include *Le soldat de 1914*, *Le salut aux chefs* (1915), *Les Élégantes*, and *La Défense de l'esprit français* (1916).

**DOURINE**. See VETERINARY MEDICINE.

**D'OVIDIO, FRANCESCO**. See OVIDIO, FRANCESCO n'.

**DOWLING, AUSTIN** (1868- ). A Roman Catholic archbishop, born in New York City. He graduated from Manhattan College in 1887, and after studying at St. John's Seminary and the Catholic University, was ordained in 1891. He served as pastor in Warren, R. I., and from 1905 to 1912 was pastor of Saints Peter and Paul Cathedral. He was consecrated Bishop of Des Moines in 1912 and Archbishop of St. Paul in 1919.

**DOWNS, LAWRENCE ALOYSIUS** (1872- ). An American railway official, born in Greencastle, Ind. He was graduated from Purdue University in 1894 and in the following year began his railroad career with the Vandalia road. He occupied many important positions with the Illinois Central Railroad until 1920, when he was elected vice president and general manager of the Central of Georgia Railway. In 1924-26 he was president of the same company and of the Ocean Steamship Company, Savannah. Since 1926 he has been president of the Illinois Central System. He was the author of *Development of Banking in Illinois* (1914).

**DOYLE, DOIL, SIR ARTHUR CONAN** (1859- ). A British novelist and spiritualist (see VOL VII). After 1913 Sir Arthur added to his long list of works with *The Case of Oscar Slater* (1914); *The Valley of Fear* (1915); *A Visit to Three Fronts* (1916); *History of the British Campaign in France and Flanders*, vols. i and ii (1915-20); *Danger* (1918); *The Guards Came Through* (1920); *Three of Them* (1923); *Memories and Adventures* (1924); *The Land of Mist* (a novel, 1925); *The Case Book of Sherlock Holmes* (1927), and *The Maricot Deep* (1928). A *New Revelation* (1918); *The Vital Message* (1920); *The Wanderings of a Spiritualist* (1921), and *History of Spiritualism* (2 vols. 1926), were written in connection with his studies in the field of spiritualism. He lectured and debated on the subject of spiritualism in

Europe and America. He related his American experiences in *Our American Adventure* (1923) and *Our Second American Adventure* (1924).

**DRAFT ACT.** See UNITED STATES, History.

**DRAFT TREATY OF MUTUAL ASSISTANCE.** See WASHINGTON CONFERENCE.

**DRAGE**, drāj, GEOFFREY (1860- ). An English sociologist (see Vol. VII). He was a member of the Departmental Committees National Register (1915), vice president of the Royal Statistical Society (1916-18), chairman of the Denison House Committee on Public Assistance (1916), and chairman of the Official Statistics Committee (1919). In 1916 he was attached to the War Office in the military intelligence section, and in the following year was director of the Investigation Board of Agriculture. Among his later works may be mentioned: *Ephemera* (1915); *Reorganization of Official Statistics and a Central Statistical Office* (1916); *Pre-war Statistics of Poland and Lithuania* (1918); *The Cost of Public Assistance* (1921); *The Dole and Demoralization* (1923); *The Riddle of Japan* (1925); and *Poor Law Reform* (1927).

**DRAINAGE RECLAMATION.** See RECLAMATION.

**DRAKE**, DURANT (1878- ). An American professor of philosophy. He was born at Hartford, and was educated at Harvard and Columbia Universities. In 1812 he joined the faculty of Wesleyan University, and in 1915 became professor of philosophy and education at Vassar. He was one of a group of seven who published the *Essays on Critical Realism* (1920). Among his other writings are *The Problem of Things in Themselves* (1911); *Problems of Conduct* (1914); *Problems of Religion* (1916); *America Faces the Future* (1922); *Mind and Its Place in Nature* (1925); and *The New Morality* (1928).

**DRAKE UNIVERSITY.** An institution for the higher education of men and women, at Des Moines, Iowa, founded in 1881. The student enrollment increased from 1594 in 1913 to 1735 in the autumn of 1928, and the faculty from 80 to 90 during the same period. The fixed endowment in 1928 amounted to \$1,266,770, and the number of volumes in the library to 51,024, as compared with 26,000 volumes in 1913. Drake University Municipal Observatory was built by the city of Des Moines in Waverland Park in 1921. Arthur Holmes, Ph.D., succeeded Hill M. Bell as president in 1918, and was in turn succeeded by Daniel W. Morehouse, Ph.D., in 1922.

**DREIER**, MARY ELISABETH (1875- ). An American social worker, born in Brooklyn, N. Y., and educated in private schools, at home, and at the New York School of Philanthropy. From 1906 to 1915, she was president of the Woman's Trade Union League, subsequently serving on the executive committee. From 1911 to 1915, she was a member of the New York State Factory Investigating Commission, and in 1915 was appointed to the Board of Education by Mayor Mitchel. She resigned in order to give all her time to work for woman's suffrage. She was chairman of the New York State Committee on Women in Industry of the Advisory Commission of the Council of National Defense and of the Women's Joint Legislative Conference (1918-27).

**DREISER**, THEODORE (1871- ). An American author and journalist (see Vol. VII).

His most important later works are *The Titan* (1914); *The Genius* (1915); *Plays of the Natural and Supernatural* (1916); *A Hoosier Holiday* (1916); *The Hand of the Potter* (1919); *Hey-Rub-a-Dub-Dub*, a book of essays and philosophy; *Book About Myself* (1922); *The Color of a Great City* (1923); *An American Tragedy* (1925); *Moods* (verse, 1926); *Chains*, stories (1927); *A Gallery of Women* (1928); *Dreiser Looks at Russia* (1928); and *The Genius* (1928). From his first novel, he has, with each new book, been accused of immorality. His works show a mind of titanic force dealing with dispassionate insight and compassion with the motives and forces that surround mankind. See *A Bibliography of the Writings of Theodore Dreiser*, by Edward D. MacDonald (1928).

**DRESDEN**, drēz'den, Ger. pron. drās'den. Capital city of the Free State of Saxony, Germany, and of the County of Dresden (see Vol. VII), the sixth largest city of Germany. It is situated on both sides of the river Elbe where it is 170 yards wide. The number of inhabitants was 548,308 in 1910; 529,326 in 1919; and 619,157 according to the census of June 16, 1925.

Of the many industries, cigarettes, porcelain, pottery, glass, sewing and writing machines, chocolate, photographic apparatus, tinware, and bicycles are the most important. In 1922 there were more than 100,000 factory workers in the city, the industrial centre is largely near the railroad and the Elbe, and because it spreads out beyond the boundaries of the city, the appearance is not that of an industrial centre. Dresden has a stock exchange, a chamber of commerce, a branch of the Reichsbank, and other banks of importance. With 2300 meters of quays, warehouses, and other facilities, it is the fourth port of transshipment of the Elbe. In 1924, 2507 craft with 237,100 tons of goods entered the city and 2477 craft with 129,800 tons of goods left the city. Also 12,572 tons of floating wood entered the city. It is the seat of three shipping companies, has an airport connecting with various parts of Europe, and also seven railroad lines, several stations, and a railroad bridge over the Elbe.

Dresden is governed by a chief burgomaster, two burgomasters, 30 aldermen, and a council of 84 city representatives. In 1927 a new system of supplying the city with electricity for both light and power was installed.

**DRESEL**, ELLIS LORING (1865-1925). An American diplomatist, born at Boston, Mass., and educated in private schools in the United States, Switzerland, and Germany, and at Harvard University. He practiced law in Boston from 1892 to 1915, then went to Berlin as attaché of the American Embassy, and until 1917 was special representative of the State Department there. On the declaration of war by the United States, he was sent to Berne in the same capacity. He organized the Central Committee for American Prisoners, and was the representative in Switzerland of the American Red Cross and of the War Trade Board. He became first secretary of the Legation in 1918, and in the same year, attaché with the American delegation to the Peace Conference in Paris. He was named honorary counselor to the American Embassy in 1919, but did not enter upon his duties, being appointed American commissioner to Germany in the autumn of the same year. As plenipotentiary of the United States

Government, he signed the peace treaty with Germany on Aug. 25, 1921. He was chargé d'affaires in Berlin, 1921-22.

**DRESSER, HORATIO WILLIS** (1866- ). An American author prominent in the New Thought movement. He was born at Yarmouth, Me., and educated at Harvard University. He early began his career as a telegraph operator and railroad agent in California, but returned to Boston and became editor and publisher of the *Journal of Practical Metaphysics* (1896-98) and of the periodical entitled *The Higher Law* (1899-1902). He was assistant in philosophy at Harvard, 1903-11. His writings, which are mostly philosophical, include: *The Power of Silence* (1895); *The Perfect Whole* (1896); *In Search of a Soul* (1897); *Methods and Problems of Spiritual Healing* (1899); *Education and the Philosophical Ideal* (1900); *A Book of Secrets* (1902); *Health and the Inner Life* (1906); *A Physician to the Soul* (1908); *A Message to the Well* (1910); *Human Efficiency* (1912); *The Religion of the Spirit in Modern Life* (1914); *Handbook of the New Thought* (1917); and *The Victorious Faith* (1917). He edited *On the Threshold of the Spirit World* (1919); *A History of the New Thought Movement* (1919); *The Open Vision* (1920); *The Quimby Manuscripts* (1921); *Spiritual Health and Healing* (1922); *Psychology in Theory and Application* (1924); *Ethics in Theory and Application* (1925); and *History of Ancient and Medieval Philosophy* (1926).

**DRESSLER, WILLY OSKAR** (1876- ). A German writer on art and interior decoration, born in Berlin. His principal works are *Möbel im Zimmer der Neuzeit* (1901); *Moderne Silbergeräte* (1902); *Geschichte des Porzellans* (1904); *Kunstgewerbe oder angewandte Kunst in Beziehung zur künstlerischen Kultur* (1910); *Neugestaltung der Veralternung der Kunstgegenstände im Reich und in den Bundesstaaten* (1917); *Der Eckstein in der Wirtschaft von den Werkleuten vergessen!* (1921).

**DRIESCH, DRËSH, HANS A. E.** (1867- ). A German biologist and philosopher (see Vol. VII). In 1921 he became professor at the University of Leipzig. His writings after the World War were largely concerned with speculative and metaphysical problems. Professor Driesch was also very much interested in psychical research and served on committees investigating various spiritistic mediums. His published works after 1914 include *Leib und Seele* (1916); *Wirklichkeitslehre* (1917); *Wissenschaft und Denken* (1920); *Metaphysik* (1924); *The Crisis in Psychology* (trans., 1925), and *The Possibilities of Metaphysics* (trans., 1926).

**DRINKWATER, JOHN** (1882- ). An English poet, playwright, and critic, born at Leytonstone, Essex. He was educated at the Oxford High School and served for 12 years as insurance clerk. He then turned his attention to theatrical enterprises and became manager and producer to the Pilgrim Players, who later developed into the Birmingham Repertory Theatre Company. His first volume of poems appeared in 1908 and his first play, *Cophetua* (in verse), in 1911. After that he wrote a great many plays, poems, and critical studies. Among the latter are *Critical Studies of William Morris* (1912); *Swinburne* (1913); *The Pilgrim of Eternity: Byron, a Confliot* (1925); *Mr. Charles, King of England* (1926); *Oliver Cromwell: A Character Study* (1927); and *Charles James Fox* (1928). Some of his plays are *Abraham Lincoln*

(1918), the best known to Americans; *Loyalties* (1919); *Mary Stuart* (1921); *Oliver Cromwell* (1921); *Preludes* (1922); *Robert E. Lee* (1923); *Robert Burns* (1925); and *Bird-in-Hand* (1928). The *Collected Plays* appeared in 1925 and *The Gentle Art of Theatre Going* in 1927. In 1923 his *Collected Poems* came out, the next year he published an *Anthology of English Verse*, and *Victorian Poetry. All About Me; Poems for a Child*, appeared in 1928. In 1929, with Henry Seidel Canby, he published *Twentieth Century Poetry*.

**DROP BOMBS.** See BOMBING OF VESSELS BY AIRCRAFT; ORDNANCE.

**DRUMMOND, SIR (JAMES) ERIC** (1876- ). An Englishman, Secretary General to the League of Nations since its foundation in 1919. He was educated at Eton, entered the Foreign Office in 1900, and served as private secretary to the under-Secretary of State for Foreign Affairs from 1906 to 1910, with the exception of a short period in 1908, when he was précis writer to Sir Edward Grey, the Foreign Secretary, filling this office also in 1910-11. He then was one of the private secretaries of Premier Asquith (1912-15), and private secretary to the Foreign Secretary (1916-19), accompanying Mr. Palfour on his special mission to the United States in 1917. See LEAGUE OF NATIONS.

**DRURY, ALFRED** (1859- ). An English sculptor, born at London. After attending the New College School, Oxford, he went to the Oxford School of Art, and to the National Art Training School, later studying in Paris under Dalou. After the World War, the French influence predominated in English sculpture, and Drury was one of its chief exponents. His extensive work varies from interpretative figures to marble portrait busts. He was elected to the Royal Academy in 1913, and is an Associate of the Royal Cambrian Academy. See SCULPTURE.

**DRURY, FRANCIS KEESE WYNKOOP** (1878- ). An American librarian, born at Ghent, N. Y., and educated at Rutgers College and the University of Illinois. He was assistant librarian at the Gardner A. Sage library, New Brunswick, N. J., (1899-1903); acting and assistant librarian at the University of Illinois (1907-19); assistant librarian, Brown University (1919-20), and assistant professor at Brown (1920- ). He is known as a compiler and editor. Following are his published works (compilations): *List of Serials in the University of Illinois Library* (1911); *Technical and Scientific Serials in the Library of Providence* (1920); *Some of the Best Dramas* (1917); *Plays of Today* (1921); *Novels Too Good to Miss* (1926). He also wrote *College Life and College Sport* (1924), and *Viewpoints in Modern Drama* (1926).

**DRURY COLLEGE.** A non-sectarian coeducational college founded at Springfield, Mo., in 1873. The number of students increased from 276 in 1914 to 463 in 1928, the faculty from 21 to 33, and volumes in the library from 30,000 to 45,000. The productive funds, in 1928, amounted to \$900,000, annuities to \$370,000, and the annual income to \$115,000. In the five-year period, 1923 to 1928, three new buildings, Wallace Hall, a dormitory for girls, Clara Thompson Hall of Music, and Harwood Library, were erected at a total cost of \$250,000. President, Thomas W. Nadal, Ph.D., LL.D.

**DRYDOCKS.** See DOCKS.

**DUANE, ALEXANDER** (1858-1926). An American physician, ophthalmologist, and au-

thor, born in Malone, N. Y. He received his degree in arts at Union College in 1878 and in medicine at Columbia University in 1881. While practicing as an ophthalmologist in New York, he served as medical editor to *Webster's International Dictionary*, the *Oxford Dictionary* and other less-known works and as collaborator in several important works on the eye. In 1892 he brought out an American edition of Fuchs' *Textbook of Ophthalmology*, which has gone through seven editions, and in 1903 his *Student's Medical Dictionary*. He was active during the Spanish-American War and again in the World War in the signal service. In 1899 he had published a manual of signalling which was adopted as a textbook by the United States Government.

**DUANE, WILLIAM** (1872- ). An American physicist, born at Philadelphia, Pa. He was graduated at Pennsylvania in 1892 and received his Ph.D. at Harvard in 1897. During 1907-13, he worked as an investigator at the Curie radium laboratory in Paris, then returned to Harvard, where in 1917 he became professor of biophysics. His principal investigations have been studies on the velocity of chemical reactions and induced activity, alpha rays of radium, heat effects of radioactive substances, ionization, and absorption and emission spectra of X-rays, on all of which topics he has published valuable papers. During the World War, he was chairman of the committee on X-rays in the Section on Physical Sciences of the National Research Council. For his researches in radioactivity and X-rays he was awarded the John Scott Medal and premium of \$800 (1922), the Comstock Prize of \$1,000 by the National Academy of Science (1922), and the first Leonard Prize of \$500 by the American Roentgen Ray Society (1923).

**DUBLIN.** Capital of the Irish Free State (Saorstát Éireann) and seat of political power for 26 of the 32 counties of Ireland. The population of Dublin County Borough in 1926 was 316,693. In May, 1921, the Customs House, the General Post Office, and the Four Courts were destroyed by fire but are being rebuilt; most of the business section along Sackville Street also was burned out. The famous dome of the Four Courts, which was a striking object to visitors approaching the Irish capital from the sea, has been restored. The Irish Free State Parliament (Dáil Éireann) is housed in the former residence of the Duke of Leinster and is flanked on either side by fine modern buildings, the National Museum and the National Library. The National Museum contains one of the finest collections of ancient gold ornaments in the world, dating back to pre-Christian times and a testimony to Irish culture in the past. Abbey Theatre has been made the centre of the Nationalist movement in drama and is devoted exclusively to the production of plays Irish in character and origin. Dublin Castle, where the Lord Lieutenant or Viceroy of Ireland formerly held his court, is the seat of the Courts of Justice. The corporation has spent more than £300,000 in the clearance of unsanitary areas and £2,046,475 on housing schemes. The annual expenditure on the repaving and maintenance of existing roadways, streets, and widening schemes has been approximately £140,000. The city markets have been rebuilt, libraries established, a large electricity supply plant installed, an adequate supply of water provided by two reservoirs

of 3,700,000,000 gallons capacity situated at Roundwood about 25 miles from the city, and a great system of main drainage completed. The port also has been very active. In 1927 the number of vessels engaged in foreign trade that entered the port was 5535 with a tonnage of 2,230,166, the number of vessels cleared was 5612 with a tonnage of 2,269,339. A deep-water quay, with berthage of 35 feet at low water, has been built for the accommodation of large overseas vessels. Since the War many thousands of workmen's dwellings, mostly of the cottage-garden type, have been constructed.

**DUBLIN, LOUIS I (SRAEL)** (1882- ). An American statistician, born in Kovno, Lithuania, and educated at the College of the City of New York and Columbia University (Ph.D., 1904). As statistician of the Metropolitan Life Insurance Company (1911- ), he carried out important researches upon problems of vital statistics and public health and published the results in several books and monographs. In July, 1929, he was named chairman of the executive committee to assist the Department of Commerce in making the population census of 1930.

**DUBOIS, du'bwá', CHARLES GILBERT** (1870- ). American banker and business man, born in New York City, and educated at Dartmouth. Upon leaving college, he entered business with the Western Electric Company in New York and within a little over a decade became secretary and supervisor of the company's branch houses. He was president (1919-26) and chairman of the board (1926-27), and also was comptroller of the American Telephone and Telegraph Company (1907-18) and of the American Red Cross, Washington, D. C. (1917-18). He has held the presidency or directorship of many leading trust companies and banking corporations in the United States.

**DUBOIS, EUGENE FLOYD** (1882- ). An American physician, born at West New Brighton, N. Y. He received the degrees of A.B. from Harvard (1903) and M.D. from Columbia (1906). From 1910 to 1917, he taught applied pharmacology in the Cornell Medical School and was later made associate professor of medicine. In 1913 he became director of the Russell Sage Institute of Pathology and in 1919 director and visiting physician of Bellevue Hospital. He is also in charge of the research division of the Bureau of Medicine and Surgery of the U. S. Navy, in which connection he has carried out investigations into the use of airplanes, submarines, and gas in warfare. His chief publication is *Basal Metabolism in Health and Disease* (1924). He has made various studies under the head of anthropology.

**DUBOIS, LOUIS ERNEST, CARDINAL** (1856-1929). A French prelate who was born at Saint. Calais, Sarthe, and ordained priest in 1879. He was curate at Saint-Benoît du Mans in 1895, and passed rapidly through the various grades of the Catholic hierarchy. He was Bishop of Verdun in 1901, Archbishop of Bourges in 1909, Archbishop of Rouen in 1916, and Archbishop of Paris in 1920. He became Cardinal in 1916. Cardinal Dubois was a Knight of the Holy Sepulchre and a member of the Academy of St. Thomas Aquinas. His writings included a number of biographies and historical chronicles.

**DU BOIS, WILLIAM EDWARD BURGHARDT** (1868- ). An American editor and author of Negro descent born at Great Barrington, Mass., and educated at Harvard and the Uni-

versity of Berlin. During the period 1896-1910, he was professor of economics and history at Atlanta University, and since 1910 has been editor of the *Crisis*. He has given indication of his keen interest in the advancement of the Negro, in his writings: *The Suppression of the Slave Trade* (1896); *The Philadelphia Negro* (1899); *Quest of the Silver Fleece* (1911); *The Black Folk* (1924), and *The Dark Princess* (1928). He edited the *Atlanta University Studies of the Negro Problem* (1897-1911).

**DU BOSE, HORACE MELLARD** (1858- ). A bishop of the Methodist Episcopal Church, South, born in Choctaw County, Ala., and educated at Waynesboro Academy, Mississippi, and by private tutors. He was licensed to preach in the Methodist Episcopal Church in 1876, and three years later was ordained. He was a member of the Mississippi Conference from 1877 to 1880, and held various pastorates from 1881 to 1890. From 1890 to 1894, he was editor of the *Pacific Methodist Advocate* in San Francisco; served in various pastorates for the next three years, and became secretary of the Epworth League and editor of the *Epworth Era* in 1898. From 1910 to 1915, he was again pastor, and from 1915 to 1918 was book editor for the Methodist Episcopal Church of the South, and editor of the *Methodist Quarterly Review* in Nashville. He was elected bishop in 1918, being stationed at Berkeley, Calif. He was a member of the Ecumenical Conferences which took place in 1901 and 1911. He was author of a number of religious books and pamphlets and edited the *Aftermath Series*, a symposium of reviews of problems in Biblical criticism (12 volumes, 1923).

**DU GARD, ROGER MARTIN.** See MARTIN DU GARD, ROGER.

**DUGGAN, STEPHEN PIERCE** (1870- ). An American author and political scientist, born in New York City and educated at the College of the City of New York and Columbia University. He was associate professor and professor of political science at the College of the City of New York (1896-1928); and director of the Institute of International Education (1919- ), the National Commission for Mental Hygiene, and the Council on Foreign Relations. He was lecturer on international relations at Columbia, 1924-25, and has been secretary of the American University Union in Europe since 1926. He was a member of the Philippine Educational Survey Commission (1925) and of the Institute of Pacific Relations (1927). He published *The Eastern Question—A Study in Diplomacy* (1902), *A History of Education* (1916), and *The League of Nations* (1919).

**DUGGAR, BENJAMIN MINGE** (1872- ). American educator (see VOL. VII). He was research professor of plant physiology at Missouri Botanical Garden and Washington University from 1912 to 1927 when he became professor of physiological and economic botany at the University of Wisconsin. He edited the department of physiology in *Botanical Abstracts*, 1917-26, and for *Biological Abstracts* since 1926. Professor Duggar wrote *Mushroom Growing* (1915), and contributed many articles to botanical magazines.

**DUGUIT, dū-gè, PIERRE (MARIE NICOLAS) LÉON** (1859- ). A French jurist, born at Libourne, and educated at the college there and the law faculty of the University of Bordeaux. He remained in the university as a member of the faculty, becoming its dean, and achieved an

international reputation as a sociological jurist. He was the author of *Études de droit public; L'état, les gouvernants, et les agents; manuel de droit constitutionnel* (2 ed., 1911); *Traité de droit constitutionnel* (2 vols., 1911, 3 vols., 2d. ed., 1921-23); *Les transformations du droit public*, translated as *Law in the Modern State*, by Frida and Harold Laski L. 1919 (1913), and *Souveraineté et liberté*, lectures given at Columbia University (1922). He and H. Monnier edited *Les constitutions et les principales lois politiques de la France depuis 1789* (1898, 4th ed., 1925).

**DUHAMEL, du'â-mêl', GEORGES** (1884- ). The pseudonym of Denis Thévenin, a French writer who was born in Paris. He became a doctor, but gave up that profession for literature, and, with Jules Romains and Charles Vildrac, represented what has been called the "unanimist" movement, which implied an all-pervading sympathy and participation in the "collective consciousness" of the sociologists. During the World War, he was mobilized as an assistant physician, and his descriptions of what he saw, in *La vie des martyrs* (1917) and *Civilisation* (1918), Prix Goncourt for 1919, brought him into the front ranks of the writers of his day. In 1928 he published *Les sept dernières plaies*, which, with the above books, formed a trilogy. His other works include: *L'homme en tête*, poetry (1909); *Selon ma loi*, poems (1910); *La lumière*, drama (1911); *Propos critiques* (1912); *Compagnons*, poems (1912); *Dans l'ombre des statues*, a play (1912); *Paul Claudel* (1913); *Le combat*, a play (1913); *Les poètes et la poésie, 1912-1914; La recherche de la grâce* (1918); *La possession du monde* (1919); *La pointe et Ropiteau*, a comedy (1919); *Entretiens dans le tumulte* (1919); *Élégies* (1920); *Confession de minuit* (1920); *L'œuvre des athlètes*, a play given at the Vieux Colombier (1920); *Les hommes abandonnés* (1921); *Lettres d'Auspasie*, essays (1922); *La journée des aveux*, a play produced at the Champs-Élysées, and *Quand vous voudrez* (1924); *Deux hommes* (1924); *Essai sur le roman* (1925); *Lettres au Patagon*, essays (1926); *La pierre d'Horeb* (1926); *Les plaisirs et les jeux* (1926); *Maurice de Vlaminck* (1927); *La nuit d'orage* (1928); and *Le voyage de Moscou* (1928). Many of the books were translated into English. Consult *Georges Duhamel*, by Luc Durtain (1920), *Les ouvrages de Georges Duhamel*, a bibliography, by Claude Aveline (1925), and *Georges Duhamel*, by many authors in the series *Écrivains et poètes d'aujourd'hui* (1927).

**DUKAS, PAUL** (1865- ). A distinguished French composer, born in Paris. He studied at the Conservatoire under Mathias, Dubois, and Guirand, taught orchestration there from 1909-12, and then was appointed member on the committee of studies. In 1926 he was appointed professor of composition at the École Normale de Musique in Paris, and in 1928 was elected Widor's successor as director of the Conservatoire. His most famous work is an orchestral scherzo, *L'Apprenti Sorcier*. His opera *Ariane et Barbe Bleue* (Paris 1907) quickly made its way to the principal opera houses of Germany, Austria (1908), Italy (1909), and New York (1911). Besides, he wrote two ballets, *La Péri* (Paris, 1911) and *Fantaisie chorégraphique* (Paris, 1928); a symphony in C; three overtures, *King Lear*; *Götter von Berchingen* and *Polyeucte*; and some fine piano pieces. Together

with Saint-Saëns, he completed and orchestrated Guiraud's opera, *Frédégonde* (Paris, 1895).

**DUKE, JAMES BUCHANAN** (1857-1925). An American tobacco manufacturer and founder of Duke University (see Vol. VII). He served as president of the American Tobacco Company, which he had organized, until 1912. In 1922 he gave \$1,000,000 for the endowment fund of Trinity College at Durham, N. C., and \$25,000 for a memorial gymnasium. Two years later he placed securities valued at \$40,000,000 in a trust fund to be administered by a board of trustees for educational and philanthropic purposes in North and South Carolina. This trust provided for the establishment in North Carolina of Duke University (q.v.). Trinity College was then expanded into Duke University to meet the conditions of the gift, and Mr. Duke's will greatly increased the available funds for the institution.

**DUKES, ASHLEY** (1885- ). A British author and dramatist who was educated at Silcoates School, and Manchester and Munich universities. From 1909 to 1925, with the exception of the four years which he spent on active service during the World War, he was dramatic critic for various papers. Besides translations of German plays and poems, he wrote *Modern Dramatists*, a criticism and sketch of the lives of some of them (1911); *The Youngest Drama*, more studies (1923); *The Man with a Load of Mischief*, a romantic comedy of the past, written in beautiful prose (1924), and produced in London in 1925; *The Song of Drums*, a heroic comedy about Tyl Ulenspiegel (1926); *Drama*, historical and critical essays (1926); *One More River*, a comedy (1927); *Remembrance is a Flower*, a play (1927); *The Fountain Head* (1928), and *The World to Play With* (1928).

**DUKE UNIVERSITY.** An institution for higher education at Durham, N. C., which was established in 1924 by the expansion of Trinity College, made possible through benefactions from James B. Duke, who, in 1924, executed an indenture setting aside \$40,000,000 for educational and charitable purposes, \$6,000,000 of the fund for the erection of buildings at Duke University, while 32 per cent of the income was to go to the University beginning in 1926. Later, he gave \$2,000,000 to be applied to the building fund and after his death in 1925 by his will there was added \$10,000,000 of which \$4,000,000 was for medical-school buildings. An additional \$7,000,000 was given to the building fund making a total for buildings of \$19,000,000. Under the will of the founder, Duke University is to receive 10 per cent of the residuary estate. For the new construction more than 4000 acres of land adjoining the old Trinity College campus was purchased. Eleven new buildings, including a library, a union hall for recreational and student activities, a chapel, five dormitories, a class-room building, a science hall, and a faculty apartment house are now completed and occupied. Work is progressing satisfactorily on the large group of more than forty buildings which will comprise the complete plan for the University, all of which will be built of native North Carolina stone of Cambrian formation, taken from a quarry owned by the university. Total university endowment in 1928 amounted to \$20,785,207.05. The library contains 108,865 books. The Angier B. Duke Memorial Loan Fund for students exceeds \$500,000. Enrollment in the autumn of 1928 was 1806, of which

1576 were undergraduates. There were 62 students in the graduate school of religion and 168 were enrolled in other graduate departments. The faculty and administrative staff numbered 235 in 1928. An attendance of 1484 was recorded during the summer session of the same year. President, William Preston Few, LL.D.

**DULUTH.** A city and lake port in Minnesota. The population rose from 78,466 in 1910 to 98,917 in 1920, and to 116,800 in 1928, by estimate of the Bureau of the Census. Duluth ranks second, in comparison with the principal ports of the United States, based on total freight tonnage arriving and departing, being surpassed only by New York. The harbor area is 19 square miles and the harbor frontage 40 lineal miles. There are 49 wharves handling freight other than iron ore, coal, and grain, 22 coal docks, 9 iron-ore docks, 27 grain elevators, 10 railroads serving the port, and 52 steamship lines. The facilities for handling ore, coal, and grain are probably not surpassed by any other port. In anticipation of even greater activity on the inland waters with the completion of the Great Lakes-St. Lawrence Waterway Project and the consequent development of industry and commerce throughout the central-northwestern group of States, a joint port commission has been appointed for the Duluth-Superior Harbor. This commission, consisting of six members, three of whom were from the city of Superior and three from Duluth, will conduct a study of the present facilities and services offered to shipping. It also will initiate such additional measures as seem advisable to provide the most ideal conditions for the service of ocean carriers and such other commerce as may be induced to seek inland distribution. This commission was appointed by the Governors of Minnesota and Wisconsin under the authority of the State Legislatures.

Duluth has a widely diversified line of manufactures, including iron and steel, wood, woolen, grain, cement, and dairy products. Morgan Park, a model city for workmen, was built between 1914 and 1924 by the Minnesota Steel Company, the largest single manufacturing industry, for its employees within the limits of Duluth. Duluth has 83.92 miles of street railway, 225.71 miles of sewers, 127.94 miles of paved streets, 39 miles of boulevard drive, 12 playgrounds, four athletic fields, and 75 parks. In 1927 a new municipal building was erected at a cost of \$750,000. In 1926 a toll bridge with a movable span affording a clear channel width of 227 feet was erected between the cities of Duluth, Minn., and Superior, Wis. The value of 2520 building permits which were issued in 1927 was \$4,494,388. The assessed valuation of property in Duluth, according to 1927 statistics, was \$133,728,000; the net debt amounted to \$12,342,000. In 1928 bank clearings amounted to \$439,673,000.

**DUMAS, du'má', GEORGES** (1866- ). A French psychologist, born at Lédignan (Dept. of Gard), and educated in Paris at the École Normale Supérieure. He passed both the *agrégation* and the doctorate in philosophy, and took the degree of doctor of medicine. He taught philosophy at the college of Chaptal and later became lecturer on psychology at the Sorbonne, as well as chief of the psychological laboratory at the clinic for mental maladies in the Faculty of Medicine. He was a frequent contributor to the *Journal de Psychologie*, the *Revue Philoso-*

phique, and the *Revue de Paris*. On the death of Ribot, he took over the editing of the long projected *Traité de Psychologie*. The first volume of this treatise, with contributions from 30 leading psychologists, appeared in 1923, and the second in 1924. Professor Dumas's chief interests were in the psychology of affective states. His published works include: *Tolstoi et la philosophie de l'amour*; *Les Etats intellectuels dans la mélancolie*; *La Tristesse et la joie*; *Psychologie de deux Messies positivistes* (August Comte et St. Simon); *Le Sourire*; *Névrose et psychose de guerre chez les Austro-Allemands* (1918), and *Troubles mentaux et troubles nerveux de guerre* (1919). He edited *Les questions du temps présent*; *études de culture générale*.

**DU MAURIER**, du mō'ryā', SIR GERALD (1873- ). An English actor and manager born at Hampstead, and educated at Harrow. His first stage appearance was at the age of 20 at the Garrick Theatre, London. Two years later, he joined Herbert Tree in Shakespearean repertory and also in his father's play *Trilby*. Among his successes are his parts in *Peter Pan*; *The Admirable Crichton*; *Little Mary*; *What Every Woman Knows*, and his leading parts in Conan Doyle's *Raffles* and McCutcheon's *Brewster's Millions*. He wrote the play, *A Royal Rival*, produced by Lewis Waller; also *Charles I* and *Charles II*, with the cooperation of his brother, Guy Louis Busson du Maurier, and *The Dancers* which was produced in New York in 1923-24. He was knighted in 1922. In 1928 he played Dr. Faustus in Arnold Bennett's *The Return Journey*.

**DUMUR**, du'mōōr', LOUIS (1864- ). A French novelist, born at Geneva, Switzerland, and educated at the university there and at the Sorbonne, Paris. His earlier works contained amusing descriptions of Genevese Calvinism. His works include *Un Coco de génie* (1902); *Les trois Demoiselles du père Marie* (1909); *Le Centenaire de Jean-Jacques* (1910); *L'École du dimanche* (1911); *Les deux Suisses, 1914-17* (1917); *Nach Paris!* (1919); *Le Boucher de Verdun*, being the German Crown Prince (1921); *Les défaitistes* (1923); *La croix rouge et la croix blanche; ou, La guerre chez les neutres* (1925); and *Dieu protège le Tsar*, about Rasputin (1928).

**DUNCAN**, GEORGE BRAND (1861- ). An American soldier, born in Lexington, Ky. Graduated from the United States Military Academy in 1886, he was commissioned 2d lieutenant, served as captain of volunteers during the Spanish-American War, and was appointed captain in 1899, colonel in 1916, brigadier general N. A., 1917, major general in 1918, and brigadier general, U. S. A., in 1920. He served in the Philippines as a member of the General Staff from 1914 to 1917. From the latter year to 1919, he was with the American Expeditionary Forces in France as commander successively of the 26th Infantry, 1st Division, and the 1st Brigade, 1st Division. He commanded the 77th Division from May to August, 1918, and the 82d Division during the Meuse-Argonne offensive. He was awarded decorations by the British and French governments and the Distinguished Service Medal of the United States. In 1922 he was promoted to major general, U. S. A. He commanded the Seventh Corps Area (Omaha), 1922-25, and was retired in 1925.

**DUNHAM**, JAMES HENRY (1870- ). An American clergyman and educator, born at Bed-

minster, N. J., and educated at Princeton University, Princeton Theological Seminary, the University of Berlin, and the University of Pennsylvania. He was ordained in the Presbyterian ministry in 1896, and until 1912 was pastor of the First Church at Mt. Holly. In 1914 he began his work as educator, teaching in the Haverford (Pa.) School and holding the position of professor of ethics in the College of Liberal Arts and Sciences at Temple University, Philadelphia, in 1914-15. Since 1915 he has been professor of philosophy and dean of the college. He is the author of *Freedom and Purpose—The Psychology of Spinoza* (1916); and *John Fourteen* (1917).

**DUNKERS**. See BRETHREN, CHURCH OF THE.  
**DUNLAP**, KNIGHT (1875- ). One of the leading American experimental psychologists. He was born at Diamond Spring, Calif., and educated at the University of California. In 1906 he joined the faculty of Johns Hopkins University, becoming full professor in 1916. He is managing editor of the *Journal of Comparative Psychology* and editor of *Psychology Classics*. His works include: *A System of Psychology* (1912); *Outline of Psycho-biology* (1914); *Personal Beauty and Racial Betterment* (1920); *Mysticism, Freudianism, and Scientific Psychology* (1920); *Elements of Scientific Psychology* (1922); *Social Psychology* (1925); *Old and New Viewpoints in Psychology* (1925).

**DUNN**, ARTHUR WILLIAM (1868-1927). An American educator, born at Galesburg, Ill., and educated at Knox College and the University of Chicago. He began his career as instructor in English and lecturer in sociology at the University of Cincinnati (1896-98). He headed the department of history and civics in the Shortridge High School, Indianapolis, 1900-10. In 1910-11, he was civic secretary of the City Club of Philadelphia; in 1911-14, executive secretary of the Public Education Association, New York City; and from 1914 to 1921, was specialist in civic education in the United States Bureau of Education. In 1920 he became associate national director of the Junior Red Cross, and was advanced to the position of national director in 1921. He was the author of: *The Community and the Citizen* (1907); *The Teaching of Community Civics* (with others; 1915); *Social Studies in Secondary Education* (1916); *Citizenship in Secondary Education* (1916); *Citizenship in School and Out* (with Hannah Margaret Norris; 1920); *Community Civics and Rural Life* (1920); *Community Civics for City Schools* (1921).

**DUNN**, GANO (1870- ). An American electrical engineer (see Vol. VII). He was a member of the War Department Nitrate Commission in 1916-18 and chairman of the State Department special committee on submarine cables in 1918. He also served as one of the U. S. delegates to the Third Pan-American Commercial Conference in Washington in 1927.

**DUNN**, SAMUEL ORACE (1877- ). An American transportation specialist (see Vol. VII). He wrote *American Transportation Question* (1912); *Government Ownership of Railways* (1913); *Railway Regulation or Ownership?* (1918). He also contributed articles to periodicals and lectured frequently on transportation subjects.

**DUNNING**, WILLIAM ARCHIBALD (1858-1922). An American educator and historian (see Vol. VII). He published *The British Em-*

*pire and the United States* (1914), and a *History of Political Theories* (3 vols., 1902-20).

**DUNSANY**, dūn-sā'-nē, EDWARD JOHN MORETON DRAX PLUNKETT, EIGHTEENTH BARON (1878- ). An Irish author and playwright, born in London and educated at Eton and Sandhurst. He served in the South African War with the Coldstream Guards. In the World War, he was Captain of the Royal Inniskilling Fusiliers. Many of Dunsany's works are laid in the Golden Age of Spain and are saturated with the romantic spirit of mediæval gloom and colored adventure.

His publications include: *The Gods of Pegana* (1905); *Time and the Gods* (1906); *The Sword of Welleran* (1908); *A Dreamer's Tales* (1910); *Tales of War* (1918); *Unhappy Far-off Things* (1919); *Tales of Three Hemispheres* (1920); *The Chronicles of Rodriguez* (1922); *The King of Elfland's Daughter* (1924); *The Charwoman's Shadow* (1926); *Number Six Joy Street* (with Walter De La Mare and others), stories for boys and girls (1928) and *The Blessing of Pan* (1928). Among his plays are: *The Glittering Gate* (1909); *King Argimenes* (1911); *The Gods of the Mountain* (1911); *The Golden Doom* (1912); *The Tents of the Arabs* (1914); *A Night at an Inn* (1916); *If* (1921); *Plays of Near and Far* (1922); *Alexander and Three Small Plays* (1925).

**DU PONT**, THOMAS COLEMAN (1863- ). A United States Senator and member of the well-known Delaware family, who was born at Louisville, Ky., and studied at the Massachusetts Institute of Technology. After his twenty-first year he was engaged in coal and iron mining in Kentucky and in the operation of street railways. Removing to Wilmington, Del., in 1900, he became president of the E. I. DuPont de Nemours Powder Company (1902-15). In 1908 he became a member of the Republican National Committee. He was appointed a member of the U. S. Senate to fill a vacancy (1921-22) and was elected for the term 1925-31, but because of continued ill health resigned his Senate seat in December, 1928.

**DUPRÉ**, MARCEL (1886- ). A famous French organist, born at Rouen. Under his father's instruction, his progress was so rapid that, at the age of 12, he became the regular organist at St. Vivien. Later, he entered the Paris Conservatoire, where he carried off the first prize for piano in 1905. In 1914 he won the Prix de Rome with the cantata *Psyché*. His meteoric rise to fame began in 1916, when he took Vierne's place at Notre Dame during the latter's protracted illness. In 1920 he created a sensation by playing from memory, in 10 recitals, all the organ works of Bach. Immediately after that event, he made a sensation-successful tour of England. On Nov. 18, 1921, he made his American début with the inauguration of the great organ in the Wanamaker Auditorium in New York, exhibiting at the same time his marvelous powers of improvisation. He was made Chevalier of the Legion of Honor in 1923.

**DURALUMIN**. An alloy of aluminium and magnesium. See ALUMINUM; MOTOR VEHICLES.

**DURAND**, EDWARD DANA (1871- ). An American statistician (see VOL. VII). He was employed by the United States Food Administration from 1917 to 1919, and was adviser to the food minister of Poland from 1919 to 1921. He was chief of the Eastern European Division of the United States Bureau of Foreign and

Domestic Commerce, 1921-24. Since 1924 he has been chief of the Division of Statistical Research, Department of Commerce and editor of the *Statistical Abstract of the U. S. and Commerce Year book*. He contributed articles on economic and political subjects to many economic journals, and in 1915 published *The Trust Problem*.

**DURANT**, WILLIAM JAMES (1885- ). An American philosopher and author, born at North Adams, Mass., who was graduated at St. Peter's College, Jersey City, N. J., in 1907. For four years, after graduation, he held a professorship of Latin and French at Seton Hall College, South Orange, N. J. While directing the Labor Temple School in New York City (1914-27) he obtained the degree of Ph.D. at Columbia. He is author of *Philosophy and the Social Problem* (1917); *The Story of Philosophy* (1926); *Transition* (1927); and *The Mansions of Philosophy* (1929).

**DURHAM**, HENRY WELLES (1874- ). An American civil engineer, born in Chicago. He graduated from the School of Mines at Columbia University in 1895, and was engaged on surveys with the United States Geological Survey, and with the United States Nicaragua Canal Commission and with the Isthmian Canal Commission. From 1900 to 1904, he was assistant engineer in charge of construction of the New York subway, and was resident engineer in charge of municipal improvements in Panama, from 1904 to 1907. From the latter date to 1912, he was in charge of the surveys and construction of the Cape Cod Canal, and from 1912 to 1915 was chief engineer of highways for Manhattan Borough. He was a member of the New York National Guard and served on the Mexican border in 1916. He was appointed major of engineers in 1917 and was given command of the 41st Engineers, which he commanded in France. For a time, he was in charge of forestry operations in France and later was in charge of road maintenance. He was honorably discharged in October, 1919. In 1920-22 he was engaged in making plans for the sanitation of several cities in Peru. Since 1924 he has been in charge of sanitation and paving at Managua, Nicaragua. He wrote *Street Paving and Maintenance in European Cities* (1915).

**DURKHEIM**, dur'-kän', EMILE (1858-1917). A French philosopher (see VOL. VII). He published a number of brochures on the World War and was honored by the French government with the cross of the Legion of Honor. His later works were *La Sociologie* (1915), *Education et sociologie*, essay (1922), and *Sociologie et philosophie* (1924). The sociological method of approaching philosophic problems, which he founded, was continued by a host of disciples, among whom may be mentioned Bougle, Hubert, and Mauss.

**DURTAIN**, dur'-tän', LUC (1881- ). A French author whose works include the "Conquêtes du Monde" series: *L'Étape nécessaire*; *Douze Cent Mille* (1922); *La Source Rouge*; *Ma Kimbell* (1925), and *Amérique* in two volumes, *Quarantième Étage*, three short stories (8 ed., 1927) and *Hollywood dépassé*, a novel (1928), both the result of his visit to the United States. He also wrote *Manuscrit trouvé dans une île* (1913); *Georges Duhamel*, a critical study (1920); *Face à Face*; ou, *Le Poète et toi* (1921); *L'Autre Europe: Moscou et sa foi*, an account

of his trip to Russia (1928), and a drama, *Le Donneur de sang*, played at the Odéon (1928). His volumes of poetry were *Pégase* (1908); *Kong Harald* (1914); *Lise* (1918); *Le Retour des hommes* (1920), and *Perspectives*.

**DUSE**, dōō'zā, ELEONORA (1859-1924). An Italian actress (see VOL. VII). The World War depleted her fortune, so in spite of poor health she was forced to appear on the stage again. While on an American tour, she became seriously ill with a cold and general nervous breakdown, and died at Pittsburgh, Apr. 21, 1924. Her last appearance at the Metropolitan Opera House in New York was an ovation, every seat and all the standing room being occupied.

**DUSSAP**, MME. EDGAR. See CHANTEPLEURE, GUY.

**DUTCH EAST INDIES** (NETHERLANDS INDIA). The Dutch possessions in the Malay Archipelago. They have a total area of 733,649 square miles, and a population, by the census of 1920, of 49,350,834. The 1905 census figure was 38,070,782. In 1926 the population was estimated at 51,717,688. In 1920 there were 169,355 Europeans, 48,112,706 natives, and 878,986 other Orientals, mostly Chinese and Arabs. By administrative divisions, the 1920 population was divided among Java and Madura (34,984,171), and the Outer Possessions, i. e., the Island of Sumatra (5,852,135), Riau-Lingga Archipelago (223,122), Banca (154,141), Billiton (68,582), Borneo, West Coast (605,402), Borneo, South and East Districts (1,020,599), Island of Celebes (3,108,337), Molucca Islands (622,671), Timor Archipelago (1,146,660), Bali and Lombok (1,565,014). New Guinea was included. Populations of the leading cities in 1920 were Batavia, 2,787,000; Soerabaya, 2,460,000; Semarang, 2,737,000. The great mass of the natives were Mohammedan in faith. Education made steady advances. In 1927 there were 605 public and private schools serving Europeans and people associated with them. Total attendance was 121,499, and expenditure on education amounted to 14,276,000 guilders, a guilder equaling \$0.40. There were also 16,789 native schools, with an attendance of 1,283,271, maintained at a cost of 29,540,900 guilders.

**Industry.** The majority of the population works on the land. Java and Madura, which account for a great part of the entire agricultural industry, had, in 1926, 18,106,000 acres under native culture or about 55 per cent of their total area; 1,523,000 acres were cultivated in plantations operated by Europeans, who hold most of the land leases in Java. Sugar remains the crop of greatest economic importance, and in 1926, 178 factories were serving the industry. The following table indicates the condition of native activities before and after the War as shown in exports, in metric tons:

	1913	1918	1921	1926
Sugar	1,471,428	1,540,100	1,677,187	1,741,050
Coffee	26,019	7,300	43,683	74,085
Tea	26,548	29,958	35,863	71,350
Tobacco	87,832	8,050	46,214	74,485
Rubber	7,087	44,096	73,505	269,399
Copra	229,339	68,578	811,571	415,441
Tin	2,153	11,584	13,547	18,345

Native cultures are rice, maize, cassava, potatoes, coconuts. The live stock industry also is flourishing. The government largely controlled the mines. In 1926 the principal coal mines in Java, Sumatra, and Borneo yielded 1,460,359

tons; the tin mines yielded 32,607 tons; and the principal mineral oils, 21,242,000 barrels. The oil fields are controlled by the Royal Dutch and Shell Companies. Gold is worked in Sumatra and diamonds, in Borneo.

**Trade.** Total imports, both government and private, exclusive of specie, for the years 1913, 1921, and 1926 were 463,702,000, 1,192,963,000, and 855,731,000 guilders. Exports, similarly, for 1913, 1921, and 1926 were 671,434,000, 1,190,799,000, and 1,592,409,000 guilders. The Dutch East Indies' great importance as a market for manufactured goods and a source of raw materials is being recognized by foreign commercial houses. In particular, British, Japanese, Swedish, Belgian, Danish, and German interests are active. Imports from the United States for 1913, 1920, and 1925 were valued at \$3,358,164, \$59,018,190, and \$21,442,000. Exports to the United States were valued at \$4,995,150, \$167,416,000, and \$100,961,000. In 1928 exports to the United States from Java and Madura were valued at \$53,900,793 and from other portions at \$32,251,203. In that year United States imports to Java and Madura were \$25,400,479 and to other Dutch East Indies, \$9,035,224. Shipping entered in 1913 was 6253 steamers of 5,046,000 tons and 2664 sailing vessels of 192,000 tons; in 1926, 11,506 steamers of 8,694,206 tons and 8940 sailing vessels of 526,890 tons. Chief ports are Tanjong Priok (for Batavia), Soerabaya, Semarang, Cheribon, and Tegal in Java; Padang and Belwan Deli in Sumatra; Balikpapan in Borneo, Macassar in Celebes.

**Communications.** In December, 1926, there were 3870 miles of railway both state owned and private; 1721 miles in 1913. Of the former, 2030 were in Java and 915 in Sumatra. Government telegraph and cable lines were 14,150 miles, compared with 12,310 in 1913.

**Government.** Superior administration is in the hands of the governor general. A council of five with power of a legislative and advisory nature sat for the whole territory. In 1917 a Volksraad, or people's council, was erected, with powers to discuss the budget and advise the Government. Made up of some 40 members, it included Europeans, natives, and foreign Orientals. Further extensions of home rule were granted in 1925. The 1913 and 1928 budgets showed revenues of 305,573,000 and 747,194,826 guilders and expenditures of 317,810,000 and 798,110,550 guilders. Deficits were covered by loans. The public debt on Dec. 31, 1927, was 1,056,000,000 guilders (\$422,000,000). Extraordinary expenditures went toward the improvement of the Outer Possessions and the encouragement of industries. Revenues came largely from sales of opium in India, import, export, and excise duties, land revenues, coal, and income taxes. The Dutch East Indies continued peaceful during and after the War and Dutch neutrality assured the colony an unchecked prosperity. Progress was steady in the development of the Outer Possessions. Late in 1926, several uprisings occurred in the islands, particularly in Java. The Government suppressed them and claimed that they were the result of Communistic propaganda.

**DUTCH GUIANA.** See GUIANA.

**DUTCH NATIONALISTS.** See SOUTH AFRICA, UNION OF.

**DUTCH REFORMED CHURCH.** See REFORMED CHURCH IN AMERICA.

**DUVENECK, FRANK** (1848-1919). An American painter, sculptor, and etcher (see Vol. VII). Known as one of the finest technical painters of the United States, he was an active figure in American and English art circles. During his later years, after a long period of study and of teaching in Florence, he served as instructor in the Art Academy of Cincinnati. His "Whistling Boy," reminiscent of Hals, and "Forget-me-not Girl," after the manner of Rembrandt, also his "Portrait of Professor Loeffts," were generally held to be his finest works.

**DVORSKY, MICHEL.** See **HOFMANN, JOSEF.**

**DYER, WALTER ALDEN** (1878- ). An American author and journalist, born at Roslindale, Mass., and educated at Amherst College. He began on the staff of the *Springfield Union* (Mass.) in 1901, and for the next six years edited various publications, subsequently becoming managing editor of *Country Life in America* (1906-14). He has contributed many

articles to magazines, and has written *The Lure of the Antique* (1910); *The Richer Life* (1911); *Pierrot, Dog of Belgium* (1915); *Creators of Decorative Styles* (1917); *Handbook of Furniture Styles* (1918); *Sons of Liberty* (1920); *Many Dogs There Be* (1924); *All Around Robin Hood's Barn* (1926); *The Breakwater* (1927); *Country Cousins* (1927); and *Chronicles of a Countryman* (1928).

**DYER, SIR WILLIAM TURNER THISELTON** (1843-1929). An English botanist (see Vol. VII). From 1908 to 1916, he was representative of the University of Oxford at the Gloucestershire Education Committee, and from 1909 was a member of the University of Bristol.

**ARLHAM COLLEGE.** A coeducational institution at Richmond, Ind., founded in 1859. The student enrollment increased from 413 in 1914 to 469 for 1927-28; and the faculty from 32 to 38 members. The number of volumes in the library was increased from 19,000 in 1914, to 35,900 in 1928; and yearly income increased from \$25,118 in 1914, to \$279,825 for the year 1927-28, while productive funds of the college in 1928 amounted to \$1,237,235. Carpenter Hall, a new administration and class-room building, was completed for occupancy in 1927. President, David M. Edwards, Ph.D.

**EARTH INDUCTION COMPASS.** See NAVIGATION.

**EARTHQUAKES.** About noon on Sept. 1, 1923, Tokyo, Yokohama, Nagoya, and many villages and pleasure resorts of Japan were almost entirely wiped out, in the greatest earthquake disaster of history. Earthquake, fire, and sea-wave took a toll of 99,331 killed, 43,476 missing, and 103,733 injured, over an area of about one square degree, dwarfing into insignificance each on the long list of similar disasters in the past for which Japan, one of the most seismic regions of the globe, is noted.

The Japanese Islands lie in a series of island festoons fringing the Asiatic Continent, with their convexities facing the Pacific. Outside these festoons, and not far from them, are long narrow troughs in the sea floor, running parallel to the trend of the island groups. The troughs are the downward, and the island festoons the upward, curves of great folds in the crust of the earth; in many cases, the folding movement is still going on. Stresses accumulate until suddenly relieved by faulting. The convex side of the festoon slopes more steeply than the other. The Japan Sea to the West is shallow, but on the Pacific side, between the Japan coast and the Kurile Islands, the earth's crust in one place plunges down into the great Tuscarora Deep nearly 27,000 feet, within 110 to 240 miles of the coast. The earthquakes of Japan follow a rule which is general in such cases: they are most numerous and violent on this steep slope. The epicentre of the 1923 quake appears to have been under Sagami Bay, the floor of which underwent great changes; the focus was probably about 50 kilometers (31.07 miles) deep. This was the first destructive quake to originate in the region since 1703.

The first and greatest shock came at 11.58.44 A.M.; there were no foreshocks to give warning. An unusually large number of aftershocks were recorded, 1039 in the five days following the quake, implying that the faulting movement had a pronounced vertical component. The greatest aftershocks were those on Sept. 2, 1923, and Jan. 14 and August 13-15, 1924. In Tokyo, 12 square miles were swept by the fire that followed the quake. Modern reinforced concrete structures especially designed to withstand earth-

quakes came through with a fine showing; the better constructed brick buildings also survived both quake and fire, although in general the brick buildings proved unusually dangerous. From 1914 to 1921, 199 earthquakes, some semi-destructive, originated around Tokyo, but the immediate neighborhood of Tokyo was quiet. This fact led Omori to forecast a commencement of seismic activity in the latter district after the others had become quiet, since they were all in the same seismic zone; in 1922 he predicted the occurrence of severe shocks within six years. See JAPAN.

An earthquake of truly appalling magnitude took place on Dec. 16, 1920, near Pingliang, Kansu, China. The region was thickly populated; many of the people lived in caves in the hillsides, and were buried alive by the landslides; others slept on clay platforms under which fires were kept burning, and such of these as escaped being dropped into the fires were left to die of the cold. The estimates of deaths vary from 100,000 to 1,000,000. The tremor was felt in Tokyo, 1000 kilometers away. On May 23, 1927, another quake occurred with an epicentre 130 miles farther west, in which 10,000 were killed.

In the disastrous shock in Central Italy, Jan. 13, 1915, the ratio of deaths to population was the highest ever recorded. Thirty thousand people perished, including 97 per cent. of the population of Lapelle, and 90 per cent. of the 11,000 inhabitants of Avezzano. Yet the shock was by no means of the first order of magnitude, and the destruction was chiefly due to the faulty construction of buildings. A strong tectonic quake, registered all over the globe, was associated with the eruption of Sakura-jima, Jan. 12, 1914; the epicentre was near the volcano, and the quake was of a character entirely different from that of the usual local volcanic quake.

The more important of the great number of other earthquakes which occurred during 1914-28 were: 1914, May 9, Sicily; 100 lives lost; Linera totally wrecked. 1916, Alaska, a severe quake, but the region affected was almost entirely uninhabited. 1917, June 7, San Salvador nearly destroyed; Dec. 25-29, Guatemala laid in ruins. 1918, Feb. 13, Swatow, China, several hundred perished; Oct. 11 and 22, Porto Rico, 150 lives lost, and a great deal of property destroyed; Apr. 21-23, considerable damage to property in southern California. 1919, Apr. 28, San Salvador partly destroyed; Nov. 27, several villages destroyed in western Asia Minor, and many lives lost; June 20, Central Italy shaken. 1920, May 14, heavy damage in Central Italy; Sept. 7, Carrara and surrounding territory suffered heavily, with 100 towns damaged or destroyed, and hundreds perished; January, southern Mexico; February, Transcaucasia, many villages destroyed; June 22, Los Angeles, Calif., considerable property damage. 1922, Jan. 31, a severe shock occurred off the California coast, resulting in minor damage at several points;

Nov. 11 and afterward, Chile, many lives and much property lost. 1923, near Lou-ho-hein, China, 1000 lives lost; May and September, Persia; disastrous shocks, December, Colombia and Ecuador; September, Calcutta, little damage. 1924, Mar. 14-15, five Costa Rican towns destroyed, with considerable loss of life; Apr. 14, southeast of Mindanao, a severe quake; May and September, Armenia, great loss of life. 1925, June 29, Santa Barbara, Calif., heavily damaged, and 12 lives lost, by strong local shock; Feb. 28, eastern United States and Canada rocked by a quake with epicentre south of Saguenay River in Quebec. 1926, June 26-27, Egypt and the islands of the Mediterranean and Aegean Seas, Crete and Rhodes damaged; great damage and loss of life occurred in Sumatra in June and July, and in Armenia in October and November. 1927, Mar. 7, many towns destroyed in central and western Japan, 6734 injured, 3274 killed; July 11, Palestine, 800 injured, 268 killed, in the first great quake of the region since 1837; considerable damage was caused in Jugo-Slavia in February; and on October 24 a quake of great magnitude occurred in Alaska, but without serious consequences, because of the sparsely settled character of the country. 1928, Dec. 1, Chile, 200 killed, great property damage especially in Talca and Chillan; March 22, April 13 and 17, June 16, and October 8, severe quakes in Oaxaco, Mexico, and neighboring regions; Oct. 4, Kaledijk, Turkey; April 9, Mucasani, Peru; March 10, Nehandan, Persia; March 31 and April 24, Smyrna; April, series of intense quakes in southern Bulgaria, 100 killed, 700 injured; April 22, Corinth, Greece. See PHYSICS; SEISMOLOGY.

**EAST AFRICA PROTECTORATE.** See KENYA COLONY.

**EASTMAN, GEORGE** (1854- ). An American kodak inventor and manufacturer (see VOL. VII). He has continued the manufacture of photographic equipment on a large scale at Rochester, N. Y., where in connection with his plant, he has built up important research laboratories. On July 30, 1928, he announced the perfection of a process of color photography by which an amateur may take still or moving pictures reproducing all the colors of the spectrum. In recent years, he has been personally interested in calendar reform and in African wild-life photography. Mr. Eastman's gifts to education have exceeded \$50,000,000, including a \$4,500,000 endowment for the Eastman School of Music, established as a department of the University of Rochester in 1918, and \$4,000,000 to found a school of medicine and dentistry at the same institution in 1921.

**EASTON, FLORENCE** (1884- ). A British dramatic soprano, born at Middlesbrough-on-Tees, Yorkshire. She was educated in Toronto, Canada, where, at the age of 10, she made her first public appearance as a pianist. Subsequently, she studied singing at the Royal Academy of Music in London and with E. Haslam in Paris. In 1903, she made her debut as Cio Cio San with the Moody-Manners Opera Company at Covent Garden. The next year, Savage engaged her to sing Kundry for his production of *Parsifal* (in English), which he took on an extended tour of the United States, and in 1906-07 she returned under the same manager, singing in *Madame Butterfly*. From 1907 to 1913, she sang leading rôles at the Royal Opera in Berlin and from 1913 to 1915 at the Stadtheater

in Hamburg. At the same time, she appeared at Covent Garden in the Wagner and Strauss performances. From 1915 to 1917, she was a member of the Chicago Opera Company, and then went to the Metropolitan Opera House, New York, where she immediately became one of the prime favorites. In 1904 she married Francis MacLennan, the tenor.

**EATON, JAMES SHIRLEY** (1868- ). An American railway specialist, born in Nashville, Tenn., who was graduated from Marietta College in 1889. He served as expert in the adaptation of the electric tabulating machines for railroad accounting, and from 1899 to 1903 was statistician for the Lehigh Valley Railroad. He was railroad editor for the *Wall Street Journal*, examiner for the Federal Trade Commission (1917-20) and statistician and economist for the Bureau of Economics and Engineering of the National Association of the Owners of Railway Securities (1921-22). During 1922-26 he was engaged in railroad expert work in New York City. He wrote *Railroad Operation* (1900); *Education for Efficiency in Railroad Service* (1910); *Railroad Expense Handbook* (1911).

**EATON, WALTER PRICHARD** (1878- ). An American author and critic, born at Malden, Mass., and educated at Harvard. During the period 1900-08, he was successively reporter on the *Boston Journal*, a member of the dramatic department of the New York *Tribune*, and dramatic critic of the New York *Sun* and later of the *American Magazine* (1909-18). He is the author of juvenile stories, out-of-door books, and publications on the theatre, which include: *The American Stage of To-Day* (1908); *At the New Theatre and Others* (1910); *Barn Doors and Byways* (1913); *Plays and Players* (1916); *In Berkshire Fields* (1919); *On the Edge of the Wilderness* (1920); *Boy Scouts on Katahdin* (1924); *Skyline Camps* (1924); *The Actor's Heritage* (1924); *A Bucolic Attitude* (1926); *Hawkeye's Room Mate* (1927).

**EBERLE, ABASTENIA ST. LEGER** (1878- ). An American sculptor, born in Webster City, Ia. She studied modeling with Frank Vogan in Canton, Ohio, and at the Art Students' League, New York, with George Grey Barnard. She was elected an Associate of the National Academy in 1921. Her first sculptures were copies of old gravestones in the cemetery at Canton. In New York, she found her inspiration in the life of the East Side, which she has interpreted with a great deal of sympathy. Some of her sculptures, "The Girl on Roller Skates" and "Mowgli," are in the Metropolitan Museum, New York "Little Mother" is in the Chicago Art Institute. Others are at the Worcester Art Museum, Carnegie Institute, and other centres. She exhibited in Europe with success.

**EBERLE, EDWARD WALTER** (1864-1929). An American naval officer, born at Denton, Texas, and graduated from the United States Naval Academy in 1885. He served on the *Oregon* in the Spanish-American War, in the Philippine insurrection in 1899, and commanded the Atlantic torpedo fleet from 1911 to 1913. He was superintendent of the United States Naval Academy from 1915 to 1919, and practically rebuilt its general organization and educational system. During 1921 and 1922, he was commander in chief of the Pacific fleet, with rank of admiral, and in 1923 was appointed Chief of Naval Operations in the Navy Department at Washington.

**EBERT, Eubert, FRIEDRICH** (1871-1925). A German statesman, born at Heidelberg. After an elementary education, he learned the saddler's trade, became a journeyman, and finally settled in Bremen. He was actively interested in the Social Democratic Party, edited the *Bremer Volkszeitung* in 1893, and was trade-union secretary to the Bremen Burgerschaft in 1900. It was not till 1905, when he was appointed to the Executive Committee of the Social Democratic Party, that he became widely prominent in politics. He was sent to the Reichstag in 1912 and was one of the influential members of his party who supported the Government in the World War. He attended the conference of Socialists at Stockholm in 1918. The same year, he was named Chancellor to succeed Prince Max of Baden. A strong opponent of the Spartacists, Bolsheviks, and Communists, he did more perhaps than anyone else to restore order to the country and to suppress insurrections during the revolution in 1918. He was elected first president of the Reich on Nov. 12, 1919, and his term of office was afterwards extended to 1925. His presidency was marked by the so-called Kapp putsch of 1920, the Bavarian coup of 1923, and the Saxon Communist movement of the same year. He died Feb. 28, 1925, shortly before the expiration of his term of office. Consult *Eines Menschen Weg* (1926), a biography by Emil J. Felden. President Ebert exerted a strong influence on the intellectual leaders of Germany, many of them becoming converted to the republican idea through contact with him.

**ECKENER, Hugo** (1868- ). A German airship designer and navigator, born in Flensburg. After work in economics, he took up the study of the construction and navigation of Zeppelins in 1908 and became an instructor in naval aviation during the World War and in 1920 a director of the Zeppelin Company. He made two dirigible flights to the United States from Germany, in October, 1923, as commander of the *ZR III*, and again in 1928 as commander of the *Graf Zeppelin*, repeating his successful trips to the United States in 1929 when he arranged for a round-the-world cruise. This was successfully completed from Aug. 7 to 29, 1929. Dr. Eckener then remained in the United States to arrange for the development of air transportation by dirigible with certain large financial interests.

**ECKERT, Ekert, CHRISTIAN L. M.** (1874- ). A German economist, born at Mainz and educated at the universities of Munich, Berlin, and Giessen. He was made professor of political science in Cologne University in 1902. In 1904 he was called to the University of Bonn, in 1917 he was made *Geheimer Regierungsrat* (Privy Counsellor), and in 1919-20, first director of the University of Cologne, which had just been founded. His numerous works include: *Der Fronbote im Mittel-Alter* (1897); "John Ruskin" (in *Schmollers Jahrbuch* XXVI; 1902); "Deutsche Seefahrten nach Südamerika" (in *Schmollers Jahrbuch*; 1904); *Peter Cornelius* (1906); *Bildungsfrage des Journalistenstandes* (1913); *Die wirtschaftliche Bedeutung des Wehrbeitrages, Recht und Wirtschaft* (1914); *Wirtschaftliche und finanzielle Folgen des Friedens von Versailles* (1921); *Deutsche Romfahrt* (1921); *Altater Nü* (1924); and *Umstellung der deutschen Handelspolitik* (1924). He contributed many scholarly articles to lead-

ing periodicals and edited *Rothschilds Taschenbuch für Kaufleute* (58th ed., 1920).

**ECKLES, CLARENCE HENRY** (1875- ). An American professor of dairy husbandry, born in Marshall Co., Iowa. He graduated from the Iowa State College in 1895, and took post-graduate courses at the University of Wisconsin and in Germany and Switzerland. After a year as assistant in dairy husbandry in the Iowa State College, he became professor of dairy husbandry at the University of Missouri, remaining there until 1919, when he was appointed chief of the dairy-husbandry division of the University of Minnesota. He wrote *Dairy Cattle and Milk Production* (1911), *Dairy Farming* (1916), and also bulletins on agricultural subjects.

**ECOLOGY.** See BOTANY; ZOÖLOGY.

**ECONOMIC ENTOMOLOGY.** See ENTOMOLOGY, ECONOMIC.

**ECONOMIC GEOLOGY.** See GEOLOGY.

**ECONOMIC ZOÖLOGY.** See ZOÖLOGY.

**ECUADOR, ek'wa-dör.** A South American republic on the northwest coast between Colombia on the north and Peru on the south. Its area was estimated in 1926 at 110,000 square miles, with 7430 square miles in addition for the Galapagos Island. In view, however, of still unsettled boundary disputes, the area of the country cannot be definitely fixed. A maximum claim put the area as high as 276,000 square miles. The estimated population in 1926 was given at 1,562,500. Quito, the capital city, has 80,000 inhabitants. Other large cities, with their populations, are Guayaquil, 100,000; Cuenca, 30,000; and Riobamba, 12,000.

**Industry.** Cacao is the principle crop; the total number of trees was between 80,000,000 and 100,000,000, with an annual yield of 42,000 metric tons, although in recent years production is diminishing. Exports of cacao beans in 1927 amounted to 21,766 metric tons compared with 38,224 in 1912. Coffee is increasing in importance, with an annual production from 6,000 to 10,000 metric tons. The exportation of tropical fruits, such as oranges, bananas, and pineapples, to the countries to the south also is important. The production of cotton, lentils, rice, sugar, and tobacco is increasing; ivory, nuts, and rubber are important forest products, whereas the output of lumber is gradually decreasing. Annual exports of Panama hats are valued at about \$800,000. The only mining of importance is carried on by one gold-mining company whose output in 1926 was 62,486 ounces. The oil fields of Santa Elena, worked by British companies, were producing 537,000 barrels by 1927, with a 1928 production estimated in excess of 1,000,000 barrels. In 1926 exports were \$12,763,000 and imports \$9,451,000; the United States took 39.7 per cent of the exports and furnished 42.4 per cent of the imports. Cacao constituted 49 per cent of all exports, followed by coffee. The total exports in 1928 through the ports of Guayaquil, Manta and Bahia amounted in value to 77,466,799 sucres (1 sucre=\$0.20) as against 69,073,389 sucres in 1927. Principal imports are textiles, foodstuffs, and hardware. Total exports in 1912 were \$13,689,696 and imports, \$10,354,564. The country has only a few small manufacturing plants.

**Communications.** Little building of railways has been done recently. Several short lines were projected and partially completed, notably those from Ambato to Curaray and from Quito to Esmeraldas. In 1928, 500 miles were in

operation and 100 miles more under construction. Airplane service has been established between parts of Ecuador and Colombia. Wireless telegraph stations are at Quito, Guayaquil, and Esmeraldas.

**Education.** After 1915 the educational organization underwent a series of changes. New curricula were introduced in the primary schools in 1916 and in the normal schools in 1917. In 1923 the 1488 schools in operation were attended by 101,378 pupils, as compared with 70,000 in 1911. In 1927-28 there were 1771 schools including government, municipal, and private schools having an enrollment of 128,746 and attendance of 111,699 pupils, with 2399 teachers. In 14 national "collegios" for secondary education, there was an enrollment of 2284 students with 226 teachers, while the four universities had a total enrollment of 777 distributed as follows: Central University, Quito, 380; University of Guayaquil, 240; University of Cuenca, 125, and University Cuneil of Loja, 32.

**Finance.** The budget for 1913 carried revenues and expenditures at \$9,921,000; in 1928 the ordinary budget balanced at \$10,318,000. Up to 1914, exchange was maintained at par (1 sucre=\$0.487). The outbreak of the World War caused the suspension of the gold conversion of paper and, with the continuing unfavorable trade balance, the value of the sucre steadily fell. From 1917 on, the Government attempted to fix a legal exchange rate, but an open-market rate prevailed. In December, 1923, the official rate was 4.0 sucres to the dollar, but by 1927, an entirely new financial system had been installed under the leadership of Dr. E. W. Kemmerer of Princeton University. A governmental central banking system was inaugurated and a new monetary law stabilized the sucre at \$0.20. On June 30, 1928, the total public debt was 17,018,066 sucres, as compared with 49,355,427 sucres in 1925 and 70,101,412 in 1922.

**History.** Internal affairs were turbulent well into 1915 under President Plaza. Under President Baquerizo, 1916-20, the administration was busied with fiscal affairs, in which the demands of the Guayaquil & Quito Railroad Company, the leading holder of the foreign debt, played a prominent part; the country was also involved in difficulties with the belligerent nations. The Allies protested against Germany's use of the Galapagos Islands as coaling stations and in spite of official disclaimers Ecuador's neutrality was questioned. In 1917, however, diplomatic relations with Germany were severed and Ecuador thus technically became a member of the Allied and Associate Powers. Up to 1929, it had not joined the League of Nations. By the treaty of 1916, a boundary commission was appointed to adjust the frontier between Ecuador and Colombia; the work was finished in 1919. The work which was commenced under General Plaza in the cleaning up of Guayaquil in 1913 was renewed in 1918 under Colonel Gorgas and came to a satisfactory conclusion two years later. In 1920 it was officially reported that the danger of yellow fever had been eliminated not only in Guayaquil but in several adjacent provinces. In 1920 an unsuccessful attempt was made by a British company to purchase the Galapagos Islands with a view to exploiting their valuable guano deposits. The president of Ecuador for 1920-24 was Dr. José L. Tamayo. For the term 1924-28, Dr. Gonzalo S. Cordoba was elected, but on July 9, 1925, his administra-

tion was suddenly cut short by a military *coup d'état*. The President was arrested and shortly thereafter resigned. He was exiled to Chile where he died in 1928. The military junta organized a government with Señor Modesto Jijón as Premier and General Gomez de la Torre as Minister of War and Navy. In April, Dr. Isidro Ayora became provisional President pending the calling of a constituent assembly. He presently established a dictatorship and set about effecting many reforms. Chief of these was a thorough reorganization of government finances. The Kemmerer commission, which began work in October, 1926, recommended 25 projects for putting the country's finances on a sound basis. In accordance with these recommendations, a central bank was established, beginning operations in August, 1927, and the sucre was placed on a gold basis. American experts were engaged as controller of the currency, superintendent of banks, collector of customs, and adviser to the central bank.

A return to constitutional government was decreed by President Ayora in July, 1928. On August 14, the United States gave *de jure* recognition to the existing government. A constitutional assembly was elected and on October 10 it reelected Dr. Ayora as provisional President. In accordance with the new constitution, the assembly, on Mar. 27, 1929, elected him as constitutional President for a five-year term and he was inaugurated on April 12. After debate the new constitution was ratified in the spring of 1929 and on March 25 it was proclaimed.

**EDDINGTON, ARTHUR STANLEY** (1882- ). An English astronomer and physicist, born at Kendall and educated at Owens College (now Manchester University), Trinity College, and Cambridge. He was chief assistant at the Royal Observatory, Greenwich, from 1906 to 1913, when he became Plumian Professor of astronomy at Cambridge. He was president of the Royal Astronomical Society in 1921-23 and became recognized as a leading authority on relativity. His most important publications are *Space, Time, and Gravitation* (1920); *The Mathematical Theory of Relativity* (1923); *The Internal Constitution of the Stars* (1926); *Stars and Atoms* (1927); and *The Nature of the Physical World* (1928); *Science and the Unseen World* (1929). See *ASTRONOMY*; *PHYSICS*.

**EDDY, SHERWOOD** (1871- ). An American author and a secretary of the Young Men's Christian Association, born at Leavenworth, Kan., and educated at Yale. As a national secretary of the Y. M. C. A., he worked in an honorary capacity among students in Japan, Korea, China, India, the Near East, and Russia. In the World War, he was Y. M. C. A. secretary with the British Army, 1915-17, and with the American Army in 1917. Besides works published in England and India, he wrote: *The Awakening of India* (1911); *The New Era in Asia* (1913); *The Students of Asia* (1915); *Suffering and the War* (1916); *With Our Soldiers in France* (1917); *Everybody's World* (1920); *Facing the Crisis* (1922); *The New World of Labor* (1923); *New Challenges to Faith* (1926); *Religion and Social Justice* (1928).

**EDGAR, WILLIAM CROWELL** (1856- ). An American editor and publisher, born at La Crosse, Wis., and educated at a St. Louis high school. He became manager (1882) and editor (1886-1924) of the *Northwestern Miller*, and president of the Miller Publishing Company.

He established and edited *The Bellman* (1906-19). For his part in the relief given to Russian peasants in 1891, he was decorated by the Emperor of Russia. During the World War, he assisted in the Belgian Relief movement and aided Herbert Hoover in the organization of the American milling industry. His publications include: *Story of a Grain of Wheat* (1903); *Brief in Behalf of American Millers* (1913); *Food Control and Food Fallacies* (1917); *England During the Last Months of the War* (1918); *Rhymes of a Doggerel Bard* (1921); *The Medal of Gold* (1925); *Judson Moss Bemis, Pioneer* (1926); *Christmas at Dingley Dell* (1926).

**EDGE, WALTER EVANS** (1874- ). United States Senator, born in Philadelphia. He learned the printers' trade in Atlantic City (N. J.) newspaper offices, later becoming proprietor of two of them and establishing a national advertising agency. After serving in the Spanish-American War, he became secretary to the New Jersey State Senate (1911-04), member of the Assembly (1910), State Senator (1911-16), Republican leader of the Senate (1912), and Senate president (1915). He took an active part in securing the passage of bills for workmen's compensation, a State budget system, and a central purchasing bureau, and was elected governor for the term 1917-20, resigning in 1919 to take a seat in the United States Senate for the term ending in 1925. He was reelected for the term 1925-31. He was chairman of the Senate Committee on Inter-oceanic Canals and a member of the Banking and Currency and Finance Committees. In 1929 President Hoover appointed him Ambassador to France to succeed Myron T. Herrick.

**EDINBURGH.** The capital of Scotland and seat of the supreme court, of various departments of government, of the general assemblies of the Scottish churches, and of the military headquarters for Scotland. The population rose from 320,318, in 1911 to 420,264 in 1921; in 1928 the estimated population was 426,300. The municipal area is 32,402 acres. Since 1920 the official bounds of the city have been extended so as to include the Burgh of Leith and part of the suburban district of the County of Midlothian. The city is governed by a town council of 71 members and sends 6 members to Parliament. Recent municipal improvements include the erection of a new generating station at Portobello, with a total projected capacity of 100,000 kilowatts, intended to meet the present and future requirements not only of the city but of the surrounding area. The corporation has also established on the outskirts of the city new cattle and corn markets and slaughter houses (in substitution for those which were situated in the centre of the city), at a cost of £140,746. The magnificent Scottish National War Memorial, which was designed by Sir Robert Lorimer, consists of a Hall of Honor and a heptagonal shrine, "To the Glory of God and in Memory of Scots Who Fell (1914-1918)." The seven windows are filled with stained glass, depicting war as a mysterious element in the destiny of man, and below are reliefs showing types of all who served in the World War. In the niches between the windows are figures of the virtues and stone panels with the insignia of the four Scottish divisions that fought in the War. The memorial was opened by the Prince of Wales on July 14, 1927. The same year, a beautiful war memorial was erected by

Americans of Scottish descent. In June, 1929, the 600th anniversary of King Robert the Bruce's charter to Edinburgh was celebrated, with pageantry depicting famous episodes in the history of Edinburgh and the unveiling of statues to Bruce and Wallace by the Duke of York.

**EDISON, THOMAS ALVA** (1847- ). An American electrician and inventor (see Vol. VII). The following inventions are accredited to him: Universal Stock Ticker; quadruplex and sextuplex telegraphic transmission; microtastemeter; phonograph; incandescent lamp and light system; moving pictures; alkaline storage battery; mimeograph; poured-concrete houses; transmitter of the telephone; microphone; magnetic separator. He has received more than 1000 patents. His later work was devoted chiefly to the perfection and improvement of inventions already made. At the outbreak of the World War, he designed, built and operated successfully benzol plants, carbolic-acid plants, and plants for the making of aniline salt and other products. In July, 1915, he was appointed president of the Naval Consulting Board, and in this capacity performed valuable service to the Government, for which he made many war inventions. In 1929 he received many honors on the occasion of the celebration of the fiftieth anniversary of the incandescent lamp.

**EDMUNDSON, THE REV. GEORGE** (1848- ). An English clergyman and historian (see Vol. VII). He was vicar of St. Saviour's, Walton Place, Upper Chelsea (1906-20), and rural dean of Chelsea (1916-20). In 1922 he published *A History of Holland* (Cambridge Historical Series) and *The Journal, Travels, and Labours of Father Samuel Fritz, in the River Amazon, 1686-1723*. The latter was translated and edited from the original Spanish manuscript for the Hakluyt Society.

**EDSON, KATHERINE PHILLIPS** (MRS. CHARLES FARWELL EDSON) (1870- ). An American social worker and feminist born at Kenton, Ohio, and educated in private schools. In 1912 she became a member of the Progressive Party's State central committee of California, serving for four years. Well known as an arbiter in labor disputes, she was responsible for the Minimum Wage Bill which the California Legislature passed in 1913. From 1916 to 1920, she was a member of the executive committee of the Republican State committee and, subsequently, a delegate to the Republican National Convention (1920) and a member (1920-24) of the executive committee of the Republican National Committee. In 1921 she became a member of the advisory committee of the Conference on the Limitation of Armaments. Since 1927 she has been chief of the Division of Industrial Welfare of the California Department of Industrial Relations.

**EDSTROM, DAVID** (1873- ). A sculptor, writer, lecturer, and teacher who came to the United States in 1880 from Hvetlanda, Sweden, where he was born. At 21 he decided to study art, and worked his way to Stockholm, where he attended the technical schools and the Royal Academy of Fine Arts as a pupil of Borjison. He then went to Florence and Paris, where he studied with Injalbert. He has exhibited in most of the leading cities of the United States and Europe and is best known for his metaphysical sculptures, "Fear," "Pride," "Envy," "Caliban," "The Cry of Poverty." An artist of versatile moods, Edstrom always

shows in his work the psychic character of his subject. He has made portrait busts of the Crown Prince and Princess of Sweden and many other important persons. In 1924 he lectured at Upsala University.

**EDUCATION.** See **EDUCATION IN THE UNITED STATES**; paragraphs on *Education* in the articles on the separate States and on foreign countries; and **UNIVERSITIES AND COLLEGES**.

**EDUCATION, AGRICULTURAL.** See **AGRICULTURAL EDUCATION**.

**EDUCATION IN THE UNITED STATES. STATISTICS. Attendance.** The report of the U. S. Commissioner of Education published in 1928 shows that the enrollment in public kindergartens in 1925-26 was 673,231 and in private schools 54,456, making a total of 727,687. In public elementary schools, there were 20,310,771 and in private schools 2,088,644, the total being 22,399,415. The total enrollment, therefore, in elementary and kindergarten was 23,127,102. The enrollment in the elementary school has increased 63 per cent since 1890. The general population, however, increased 87 per cent, while the school population, those of ages five to seventeen, inclusive, increased 62 per cent. It appears, therefore, that the enrollment in public schools has kept pace with the school population, but the school population has not increased as rapidly as the general population.

The enrollment in public secondary schools was 3,757,466 and in private schools and academies, 295,625, making a total of 4,053,091. There were also totals of 5,632 secondary students in preparatory departments of colleges and 23,402 in secondary courses in normal schools and teachers' colleges. The number of secondary students, therefore, was 4,132,125. The enrollment in secondary schools shows an increase of 1,055 per cent since 1890. In 1890 only 1.6 per cent of the school enrollment was in high schools. In 1926, however, 15.2 per cent of the total enrollment was in high schools.

During the school year 1925-26, a total of 434,539 pupils were graduated from the public high schools. Of this number, 190,054 were boys and 244,485 were girls. Of those who were graduated in 1925, about 37 per cent of the boys and 28 per cent of the girls entered college in 1926. The percentage of 1925 graduates who entered college in 1926 varies greatly between States. In South Carolina, the rate is 54 per cent, while in Maine it is 15.4 per cent.

For the school year 1925-26, the enrollment in public normal schools including teachers' colleges was 51,105 men and 201,802 women; a total of 252,907. In private normal schools and teachers' colleges, there were 3116 men and 14,183 women—a total of 17,290. Teacher-training students in public high schools numbered 7113 boys and 40,442 girls, a total of 47,555. In the private high schools and academies, there were 491 boys and 2521 girls, a total of 3012. The enrollment in the teacher-training departments of public colleges were 20,722 men and 58,378 women, a total of 79,100. In the private colleges, there were 24,855 men and 09,502 women, a total of 94,417. The grand total of those preparing to teach was 494,290. There are about 900,000 teaching positions in the United States. It appears, therefore, that there is one prospective teacher for every two positions.

The enrollment in special schools, public and private, was as follows:

Industrial schools for delinquents,	84,844
Schools for deaf,	17,496
Schools for the blind,	6,084
Schools for the feeble-minded and subnormal,	104,021
Schools for Indians,	29,158
Schools in Alaska,	8,055
Commercial and Business schools,	188,363
All schools in outlying parts of the United States,	149,928
The enrollment in universities, colleges, and professional schools,	767,263

There were enrolled in extension courses 390,565 students, and in summer courses 209,454. There were 62,604 students in practice and model schools and 3,772 in winter short courses. The grand total of enrollment in all types of schools was 31,037,736.

In 1925 more than 80 per cent of all of the children enrolled in kindergartens, elementary schools, and secondary schools attended each day. In that year, the schools were in session an average 169.6 days. Each child, therefore, attended on an average 136.5 days.

The average length of school life shows a remarkable increase. In 1800 the average number of days that a child spent in school was 80. In 1840 he spent 208 days in school. In 1870 the length of his school life was 582 days. In 1890 it was 770 days. In 1920 it was 1200 days, while in 1924 each child on the average was in school a total of 1246 days.

**Costs.** The total cost of public elementary schools for 1925-26, including kindergartens, was \$1,308,396,445. The public high schools cost \$697,911,735. Private elementary schools cost \$135,679,661; private high schools and academies, \$54,909,388. If the costs of all the special schools and universities and colleges be included, the total is \$2,744,979,698.

The estimated cost per pupil enrolled in 1925-26 was \$63.31 in the public elementary schools, \$185.74 in the public high schools, and \$599.81 in public universities and colleges. The increasing cost of schools has brought about serious controversies in various cities and States. In some places, there are organized bodies whose purpose is to decrease the expenditures for public education. Those who urge a decrease in expenditure point to the fact that in 1913, the per-capita cost in public schools, based upon the number in average daily attendance was \$38.31. It was \$40.43 in 1915, \$49.12 in 1918, \$64.16 in 1920, \$95.45 in 1925, and \$102.05 in 1926. In 1915, the total expenditure per capita of population was \$6.03. It was \$9.80 in 1920, and \$17.30 in 1926.

Those who oppose decreasing the school expenditures present statistics showing that the total educational expenses in 1926 were only 18.86 per cent of the expenditures for automobiles, and 36.14 per cent of the expenditures for luxuries including tobacco, soft drinks, ice cream, candy, chewing gum, theatres, jewelry, perfumes, cosmetics, sporting goods, toys, etc.

There is a pronounced tendency among school officials to reduce expenses wherever possible. Sometimes this has been accomplished by increasing the size of classes, so as to reduce the number of teachers. Sometimes cities have eliminated activities whose values were not clearly established.

**Property.** The State Departments of Education reported a total value of public elementary and secondary school property for 1926 of \$4,676,603,539. Private high schools report \$511,544,000. Teacher-training institutions, in-

cluding their endowments, had a total valuation of \$202,630,512, and colleges and universities, \$2,334,307,421. It is estimated that the property of private elementary schools is valued at \$400,000,000. This would make the total valuation for the institutions mentioned \$8,125,085,472.

**Teachers in the Public Schools.** In 1924, the last year for which data are available, the public kindergartens employed as teachers 10,852 women and private kindergartens, 2,140. In 1926 the public schools employed 75,436 men and 569,195 women, a total of 644,631. The public high schools employed 63,364 men and 106,164 women, a total of 169,538. Private elementary schools employed 1072 men and 54,570 women, a total of 56,272. The private high schools employed 7397 men and 12,748 women, a total of 20,145.

**Negro Education.** The U. S. Bureau of Education has published a summary of statistics of education of the Negro race in 18 Southern States. The enrollment in public schools was 2,213,312. The enrollment in public high schools was 55,083. The average number of days attended by each pupil in the school year 1925-26 was 93, and the average length of the school year was 132 days. Nearly 69 per cent of the Negro school population in these States was enrolled. The teachers in the Negro schools in these 18 States number 7591 men and 37,434 women, a total of 45,025. Throughout the United States, the enrollment of Negro pupils in all public schools was 38,129 boys and 60,576 girls, a total of 98,705. In addition, there were 10,261 students in private high schools. In the privately controlled universities, colleges, and professional schools for Negroes, there were in the preparatory departments 2568 men and 3002 women, a total of 5590. In the collegiate departments, there were 3840 men and 3765 women, a total of 7605. In the graduates' departments, there were 30 students equally divided between men and women. In the privately controlled universities, colleges, and professional schools for Negroes, there was an enrollment of 7593 men and 6363 women, making a total of 13,956. The public teacher-training institutions for Negroes enrolled 16,588 students of whom 3932 were men and 12,656 were women. The private institutions enrolled 5277 of whom 2299 were men and 2978 were women.

**Adult Education.** The movement to provide for the education of adults has reached a stage of thorough organization. A large number of institutions are coöperating in making it possible for a person anywhere in the United States to secure training in practically any subject that he may care to choose. The American Association for Adult Education, with headquarters at 41 East 42d Street, New York City, acts as a clearing house for all matters relating to adult education. The U. S. Bureau of Education has collected information from various institutions regarding their facilities for help. The results were published in *Bulletin* 23, 1928. Among the more important offerings are the following:

**Correspondence Study Courses.** Practically any subject desired may be taken through a correspondence course conducted by some institutions in the country. The student is expected to write all of the lessons and send them to the instructor. He in turn corrects the papers and returns them with his criticism. Anyone who

may be interested in undertaking correspondence courses should write to the State University.

**Class Work Outside of Institutions.** It is claimed that in every State of the Union there are institutions of higher learning that give class work outside of their walls. An instructor from the institution concerned meets the classes and conducts the work in much the same manner as is employed within the institution. In most cases, the institutions are compelled to require a certain minimum enrollment in order to justify them in providing the instructor. In some cases, this minimum is as low as 10 persons. Any individual desiring information regarding the possibility of extension work in his own community should make inquiry from his public-school department.

**Public Lectures and Lyceums.** It is reported by 195 colleges and universities that they render service for women's clubs, teachers' institutions, commencement exercises, and so on by providing lecturers either from their own faculties or from other sources. Many of them also furnish music and slides and films to illustrate lectures that may be used by local talent.

**Visual Instruction.** It is reported by 52 colleges and universities that they furnish visual aids for instruction and entertainment purposes. Some of these institutions offer short courses to teachers and club leaders on how to make use of visual aids that they supply.

**Home Reading Courses.** It is reported by 37 institutions that they provide home reading courses. The U. S. Bureau of Education provides no less than 31 such courses. The American Library Association supplies a series entitled *Reading With a Purpose*. There are short reviews of the books to be read. In addition to the courses supplied by the U. S. Bureau of Education and the American Library Association, courses have been prepared by the institutions themselves.

**Publications Educational in Nature.** All State universities, land-grant colleges, and some other institutions distribute publications educational in nature. In addition, the Federal Government issues many leaflets, bulletins, and other publications for general distribution. Anyone interested in such publications should communicate with his State University or with the Superintendent of Documents, Government Printing Office, Washington, D. C.

**Public Information and Package Library Service.** Information service for the public is rendered by 59 colleges and universities. This offering takes the form of library service in which the use of the institution's library is made available to all who request it or package libraries which are made up largely of magazine clippings selected from current issues of pamphlets and reports. Some of the institutions collect and send packages on more than one thousand subjects. To supplement the assistance offered by library and package library service, some of the institutions through extension divisions prepare and supply bibliography and study outlines. The University of North Carolina furnished such assistance to no less than 700 clubs during one year.

**Community Drama.** There are 54 colleges and universities assisting local communities in interpreting through pageants, folk plays, and dramas the spirit and the history of the State. The University of Indiana has a collection of

more than 1000 plays that have been found suitable for schools, churches, and clubs.

*Institutes, Conferences, and Short Courses.* There are 141 institutions equipped to aid local communities by holding institutes, conferences, or short courses. The conferences and institutes deal with local or State problems. The courses deal with a great variety of subjects such as various phases of farming and home problems. There is an increasing demand for short courses for business men and technical workers in such subjects as salesmanship, applied psychology, highway engineering, and banking.

*Parent-Teacher Association or Other Club Service.* There are 64 institutions equipped to promote parent-teacher associations or other club service by assisting in the formulation of programmes, distributing literature, and in some cases by helping in the preparation of monthly bulletins. The parent-teacher movement has developed to such an extent that a number of colleges provide courses on the principles, practices, and policies of parent-teacher associations.

*Radio.* There is an increasing number of courses offered by radio. Radio is used by 65 institutions either in giving lectures or in conducting other extension work. At present, there is no way of determining how many people are assisted by such courses, but 5000 people enrolled for courses given by radio by the division of university extension of the Massachusetts State Department of Education.

*Curriculum Revision.* Changing the curricula or courses of study in the elementary and secondary schools has been an important activity in educational circles since 1920. For 30 years prior to this time, attention had been focused primarily upon methods of teaching. New subjects had from time to time been added, but little attention had been devoted to the selection and organization of subjects, so that they might conform to the teachings of modern psychology and sociology. As a result, the curriculum has been crowded, and there is a growing conviction that much of the subject matter taught is not of real value. At the same time, it is believed that many subjects of real value have been omitted.

The methods used in producing new curricula differ very decidedly from those employed earlier. It has been customary to depend upon one person or at most a small group to develop particular courses of study. At present, each person connected with administration, supervision, and instruction has a responsibility. In some cities, teachers have been freed from their regular class-room work for a period of several months in order that they might put their entire time and attention to the development of new courses of study.

In the past, little attention was given to the selection of subject matter that met the needs of a given community or that took into account the interests of the children. Now the selection of material which shall be taught represents a serious attempt to analyze conditions that affect the child as well as society at large. The effort is made to combine or fuse subjects in order that they may better meet the needs of the school.

The traditional curriculum had a strictly logical organization of its subject matter. There is a strong tendency now to organize the curriculum about activities or problems with which the children are expected to deal.

The professional literature bearing upon the curricula has greatly increased. Courses bearing upon this subject have been introduced into all the teacher-training institutions, and all the national organizations connected with education have devoted much time to the discussion of this topic, several having published important year books that deal with curriculum construction.

*Industrial Education.* Three major purposes may be recognized in the provisions that are made for industrial education in the public schools. These have been described by Maris M. Proffitt in a bulletin entitled *Industrial Education*, published by the U. S. Bureau of Education. They are:

1. Training for the creation of an industrial product or service. For example, training for carpenters, bricklayers, welders, pattern makers, foundrymen, and tailors is for the purpose of providing an industrial product. The training involved in fulfilling this purpose is strictly vocational and must, therefore, be given in special schools or in schools having special equipment.

2. Training in the use of industrial products and services, common to home life and leisure-time activities, and which are of a non-vocational character. For example, training in the common and ordinary use and care of such industrial products as furniture, automobiles, electrical machinery, and apparatus, and for such industrial services as electricity, gas, and water in the home. The aim is to make more intelligent consumers. The courses that are offered for this purpose are not designed to train pupils for employment. They are a part of the general educational programme in most modern schools.

3. Training in exploratory and developmental forms of experiences. Courses offered for the realization of this objective include projects in a variety of activities, such as woodworking, metal working, painting, and electricity. The work is planned not to give the first part of several trade courses but to provide the individual, through controlled experiences, opportunities to react in connection with a variety of materials, tools, and operations.

*Intelligence Testing.* Since the World War, public schools have given a large amount of attention to the testing of the intelligence of pupils. While this plan is not universal, it is true that by far the greater number of pupils in the United States have been tested. In recent years, there has been a marked tendency toward grouping children on the basis of their abilities. The child's standing in the intelligence test has been one basis for such grouping. In the language of the school, there have been X, Y, and Z groups. Usually the X group represented those of superior ability and attainments; the Y group, those who are normal; and the Z, those who are inferior. This method of grouping children has developed as a logical procedure rather than as the outcome of definite research. It has brought in its wake many protests and a large amount of dissatisfaction. Those who have favored the plan have undertaken to answer the objections that have been raised, and they have made a very plausible case for intelligence testing.

There are three well-defined positions in regard to intelligence testing, especially as applied to public-school children. Those who have been instrumental in developing the intelligence tests have in general assumed a very decided validity for the tests. They have asserted in effect that intelligence is an inherited quality and that it does not change. There have been schools in which children have had their intelligence tested in the first grade, and this has been taken as a measure of their intelligence throughout the elementary school period. Those who employed this procedure have made the as-

sumption that intelligence can be measured and is measured by tests that are now in existence.

Directly opposed to the view just mentioned has been a conception that intelligence cannot be measured by any of the devices that are in existence at the present time. Those who advocate this view insist that, even though it were possible to measure intelligence, it would be a most dangerous procedure, for it would inevitably lead to an aristocracy as well as to unlimited discouragement and distress. They, therefore, condemn unqualifiedly any attempt to make use of any intelligence testing in the public schools.

There is a third group who insist that the intelligence tests as we now have them tend to measure environmental influences quite as much as they measure inherited capacities. This group would not condemn the use of the tests, but they do condemn the interpretations that have been placed upon the results.

The National Society For the Study of Education appointed a committee of outstanding psychologists who brought together in a year book the significant investigations. The year book, which appeared in February, 1928, is entitled *Nature and Nurture, Their Influence Upon Intelligence*. Briefly stated, the results of investigations and experiments seem to show that the child's intelligence as measured by tests is affected by environment.

It is too early to determine the effect that these investigations will have upon the practice in the schools; it is true, however, that the findings have received serious attention, and there is now a tendency among psychologists to be more conservative than was the case earlier.

**New Departures in Elementary Education.** *Junior High Schools.* Studies of school attendance beginning in 1907 called attention to the remarkable dropping off of students between the elementary and high school and in the first year of the high school. A study of the reasons for this led to the belief that the lack of coordination between the elementary school and the high school was largely responsible for this condition. Almost none of the subjects studied in the elementary school were continued in the high school. Between the two institutions was a sharp cleavage in organization as well as in teaching methods. The last year of the elementary school was largely devoted to a review of the work of the school. These and other considerations led school officials to formulate plans for the organization of a new element in the school system, which came to be known under various names, most commonly, junior high school. This school usually cares for the children of the seventh, eighth and ninth school years. The effort is made to have the courses of study include a wider range of subjects than under the other form of organization. This is for the purpose of giving boys and girls the opportunity to explore various fields and and to determine their fitness for such work as will follow in the high school, which under this plan is known as the senior high school. The junior high school, or intermediate school, as some prefer to call it, has now reached a position of great importance. There are no less than 3058 schools of this character, and most cities are now making provision for them in their new building programmes.

*The Platoon School Organization.* This form of school organization, also known as the "work-

play-study" school, was designed to meet the newer conditions which exist especially in the larger cities. It has been extensively employed in the schools of Detroit. Typical platoon schools have 20 to 28 sections or classes of 40 pupils each. The buildings provide a gymnasium, an auditorium, open-air play rooms, special rooms for music, art, literature, science, and library, and "home rooms" which correspond to the usual class rooms. The standard school day is six hours long, a three-hour session in the morning and a three-hour session in the afternoon. The usual morning session is from 8:30 to 11:30, and the afternoon session from 12:30 to 3:30. Some schools have a somewhat longer noon period. With the exception of pupils of the first grade and those especially excused, all pupils remain in school six hours and are busy during this entire period. The school membership is divided into two groups or platoons. While one group is engaged in the home room, or regular room, the other group is attending classes in the special rooms. Thus, half of the pupils are in the home rooms at any given time and the other half are engaged in special activities. For home-room activities, the school day of 6 hours is divided into four periods of 90 minutes each. Each platoon has home-room work for 90 minutes in the morning and 90 minutes in the afternoon.

For special-room activities, the 6-hour day is divided into 12 30-minute periods. Each platoon is engaged in special activities during 6 of these 12 30-minute periods each day. Each pupil spends 90 minutes of the morning in the home room under the control of the home room teacher and the remaining 90 minutes of the morning in the special activities, 30 minutes in 3 separate special rooms. In the afternoon, he again spends 90 minutes in the home room and the remaining 90 minutes in 3 special rooms. The number of special-room activities possible in a platoon school is determined by the number of classes or groups of pupils involved. If there are 20 classes, the school must house 800 pupils, or 400 in each platoon. This requires 10 home rooms to care for 400 pupils. The remaining 400 pupils may be provided for in special rooms. The cost of buildings for the platoon schools is somewhat greater per pupil in the 20-section schools and a little less in the 28-section schools than in the traditional schools. The capacity of the school building is increased by more than 40 per cent by the platoon organization. The per-capita cost of instruction is about the same in both types of schools.

*The Dalton Laboratory Plan.* Following 1890 many efforts were made to provide individual instruction in the class room. Some of these plans were widely advertised and they were introduced into various school systems. By 1920, however, scarcely an evidence of these earlier attempts existed. The demand for individual attention had increased rather than diminished. The Dalton Laboratory Plan as developed by Miss Helen Parkhurst and first used in 1919 has become one of the outstanding plans for providing individual instruction.

Miss Parkhurst first tried her plan with a group of crippled children in 1919. The next year, it was introduced in the Dalton, Mass., High School. Miss Parkhurst spent the summer in 1921 in England, where she conducted a model school according to the Dalton Laboratory Plan and lectured to groups of teachers

and school officials. The plan was immediately adopted by a large number of schools throughout England. It is estimated that more than 7000 schools in the United States are conducted at least in part according to this plan. Miss Parkhurst conducts a school of her own in New York City. It is called The Children's University School. Her book, *Education On The Dalton Plan*, has been translated into several languages, and she has been invited by various foreign countries to aid in the reorganization of some of their schools.

The Dalton Laboratory Plan may be applied in the high school and in the elementary school from the fourth grade up. For convenience, the different parts of the curriculum are divided into major and minor subjects. The former group includes mathematics, history, science, English, geography, foreign languages, etc.; the latter, music, art, handiwork, domestic science, manual training, gymnastics, etc. Miss Parkhurst advises that the plan be introduced with major subjects first. Each subject is then divided into what would correspond to 20-day periods or jobs and the pupil accepts the jobs assigned for his class for a month as a contract. Each child has in his possession a complete outline of the work which he will be required to do for four weeks. These outlines, made by the teachers, are explicit. The children are grouped much as they would be in a regular public school and are always identified with forms or grades. At the opening of school in the autumn, the child receives the assignment of jobs that he is supposed to do in the next 20 school days, or four school weeks. Having accepted his contract, the child is free to approach his work in any way he may choose. No classes are taught as in the ordinary school procedure. A child may, for example, choose to do all of one subject during the first few days and to leave the other subjects untouched. He knows exactly how much he must do, and he knows at the end of each day of study how far he has progressed. He must complete the entire contract before he can receive other jobs, but he may receive the next contract whenever he has completed the jobs called for in the contract under consideration. If, therefore, he is able to accomplish the work planned for four weeks in three weeks, he immediately goes to the next contract. If he cannot complete it in the four weeks, he may have a longer time. In this way, each child progresses at his own rate.

The different classes or forms meet occasionally, perhaps two or three times a week, for group conferences with their teachers. Aside from these group meetings, the teachers deal with individuals, and the pupils call for help when they need it and are required to report on progress in accordance with their assignment. The rooms in which the teachers meet the children are called laboratories instead of class rooms. In the Children's University School, there is no such furniture as in an ordinary school room. Since the children do not recite as an entire class, there is no need for a large number of seats or desks in a room. They come to the laboratory for the purpose of consulting the books there, or to consult the teacher.

A system of charts or graphs designed by Miss Parkhurst makes it possible for the teacher as well as the child to know just where they stand. The teachers therefore are able to assist the children in properly apportioning their time.

It is claimed that children very soon learn to apportion their time in the most effective way.

*Nursery School or Pre-kindergarten.* The education of children of pre-school age is receiving a large amount of attention. There are those who have made the claim that much adult life is dependent upon the way in which the individual is treated in the first three or four years of his life. A significant outcome of the study of young children has been the formation of a new type of school called the nursery or pre-kindergarten school. In such schools, children from two and one-half years up are received and given such training and exercise as they are supposed to require. These schools should not be confused with the institutions formed to take care of the young child in order that the mother may be permitted to work. The nursery school receives children from all types of homes, and it has its justification in its efficiency as an educational institution. There are a number of private nursery schools. In some cases, schools of this character are conducted in connection with social settlements, public health centres, day hospitals, etc. Various colleges, universities, and teacher-training institutions support nursery schools in connection with their model or practice schools. No public-school system has yet assumed the entire responsibility for operating a nursery school. This is due in part to the lack of legal rulings that would permit the appropriation of funds for such expenditures.

Research centres in the field of nursery education have been established at Columbia University, Cornell University, University of California, University of Iowa, Johns Hopkins, University of Minnesota, Yale University, and Merrill-Palmer School of Home Making, in Detroit. The Laura Spelman Rockefeller Foundation has given financial assistance toward furthering research of this character.

*Progressive Education.* Since 1918 the term "progressive education" has been employed to designate either a certain theory of education or the practice that is followed in some schools. The theory that gave rise to this name differs from that which has operated in public and private schools in that it emphasizes the importance of the individual and urges a greater respect for individuality and freedom than is found in traditional schools. The work that takes place in such schools is usually characterized by a large degree of informality. Children are encouraged to be creative rather than to conform to standards that have been set by others.

Progressive schools do not ignore such requirements as college admission, but in general they do not require strict adherence to a set course of study or to the following of a single text. It is maintained that children who are treated in this more liberal way obtain not only a wealth of knowledge, skills, and attitudes that are usually lacking in the traditional schools but also they obtain a better control over the formal subjects that are made the basis in the ordinary school. There has been no extensive investigation into the validity of the claims made by those who advocate progressive education. In some cases, schools that have claimed to follow this plan have failed. Others have found it necessary to modify their plans to the extent of utilizing at least some of the methods

in regular schools. Still others are apparently succeeding in following the general notions that have been advanced. It is generally conceded, however, that this movement has had an important influence on the regular schools. Many of the plans that have been advocated by those who believe in progressive education have been adopted.

**Vocational Education. Part-time Courses.** There is an increasing interest in part-time and evening courses on the part of those who have entered upon employment. In general, the students who attend such classes are subject to the part-time educational laws which provide that all young people who are employed must attend school for a given number of hours each week until they reach a certain age which varies in the different states. In Chicago, the age limit is 17 and may be extended to 18. In New York, the limit is 18 years. The use of part-time courses is not confined to those who are compelled to attend. Young workers who desire to become more proficient are attending such courses in increasing numbers. There are in existence part-time apprenticeship courses in which the student alternates between the school and industry. Twenty-five of Pittsburgh's largest industrial plants are coöperating with the public schools in such work.

Various industrial organizations throughout the country maintain educational courses for their employees. The Henry Ford Trade School is a noteworthy example. It is maintained for boys between 12 and 18 years of age. It reports an enrollment of 1800. Each boy receives at the start \$7.20 per week and in addition \$2 a month for a savings account.

**Continuation Schools or Courses.** Part-time courses that are designed primarily to care for those who are compelled to attend are often called continuation courses. Objections have been made to continuation classes on the ground that employers were unwilling to allow their workers the several hours each week that the law requires. It has been asserted that this attitude on the part of employers has made it difficult and often impossible for worthy young people to secure employment. Those who have charge of continuation work do not deny that this condition exists, but they urge that the difficulty can easily be overcome.

**Vocational Training for Disabled Civilians.** In 1920 Congress provided for civilian vocational rehabilitation. Before this, several States had compensation laws designed to help those who were in economic straits because of accidents in connection with their occupations. There were also various philanthropic organizations that endeavored to aid such unfortunates and to assist them in finding employment. There was, however, no organized plan for training such adults to undertake new work.

(Under the provisions of the law, the Federal Board of Vocational Education is required to coöperate with the various States in "the promotion of vocational rehabilitation of persons disabled in industry or in any legitimate occupation and their return to civil employment." For the year ending June 30, 1926, the total expenditures for civilian rehabilitation were \$1,272,877.30, of which \$578,847.33 was Federal money and \$694,039.97 was supplied by the States. The total number of persons rehabilitated for that year was approximately 5600.

See UNIVERSITIES AND COLLEGES.

**EDWARD, (ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID), PRINCE OF WALES (1894- )**. The eldest son of King George V and Queen Mary of England, born at White Lodge, Richmond Park. The Prince began to prepare for the navy when he was eight years old; in 1907, he entered Osborne and in 1909 the Royal Naval College at Dartmouth. Upon becoming a midshipman, he was appointed to H.M.S. *Hindustan*. In October of 1912, he entered Magdalen College, Oxford, but his university career was cut short by the outbreak of the World War. During the War, he served as aide-de-camp to Sir John French in Flanders and in France, with the Mediterranean Expeditionary Force in Egypt, on the Italian front, and subsequently with the Canadian and Australian forces in France and Belgium. The Prince visited Canada and the United States in 1919, on H.M.S. *Renown*, and in the next year went to New Zealand and Australia by way of the Panama Canal. In 1921 he visited India, and in 1923, made a hasty visit incognito to his ranch in Canada. In 1924 he went to the United States and again to his Canadian ranch. The next year he made a trip of over six months, visiting Africa and South America. In 1926, as President of the British Association for the Advancement of Science, he gave the opening address at its meeting at Oxford. The following year, he and his brother, Prince George, visited Spain in April. In August, accompanied by Prime Minister and Mrs. Baldwin, the two Princes went to Canada to celebrate the sixtieth anniversary of Canada's becoming a Dominion. In September, 1928, the Prince of Wales, accompanied part way by his brother Prince Henry, the Duke of Gloucester, started on a four months' tour of East and South Africa, which was interrupted by the serious illness of King George. On December 2, the Prince left Dar-es-Salaam on H.M.S. *Enterprise*, left her at Brindisi, Italy, for a special train, and reached London on December 11, after a journey of more than 6500 miles accomplished in nine and one-half days. He was appointed one of the six counselors of State to take over the work of the King during his illness. The Prince's career has been characterized by democratic simplicity. In the winter of 1928-29, he called the attention of the country to the condition of unemployed miners and their families by a tour of the mining districts.

**EDWARDS, THE MOST REV. ALFRED GEORGE (1848- )**. An English clergyman, the first Archbishop of Wales, born at Llanymawddwy, and educated at Jesus College, Oxford. He was ordained curate of Llandinog, Carmarthen, in 1874, becoming headmaster of the college, Landover, a year later. He became vicar and rural dean of Carmarthen in 1885, bishop of St. Asaph in 1889, and in 1920, after the disestablishment of the Welsh Church, was created Archbishop of Wales. In that year, he received honorary degrees from Oxford, Cambridge, and Wales. His publications include: *The Church in Wales* (1888), *Commonsense Patriotism* (1894), *Landmarks in Welsh Church History* (1912), and *Memories* (1927).

**EDWARDS, CLARENCE RANSOM (1860- )**. An American soldier, born at Cleveland, Ohio. He was graduated at the United States Military Academy in 1883, and by successive promotions attained the rank of major general and was retired in that grade in December, 1922, after 40 years of service. He participated in the cam-

paigms in the Philippines, serving as adjutant general on General T. W. Lawton's staff in 1899. In 1902 he was made chief of the Bureau of Insular Affairs. In 1912 he returned to regular Army service and during 1915-17 was in command of the United States troops in the Panama Canal Zone. Later, he had charge of the Department of the Northeast, where he organized in 1917 the 26th "Yankee" Division. He was in France during 1917-18 on front-line duty. On his return to the United States, he was assigned to the command of the First Corps area with headquarters in Boston. He received the Croix de Guerre with palm and was made an officer of the Legion of Honor.

**EDWARDS, EDWARD IRVING** (1863- ). A United States Senator, born at Jersey City, N. J., and educated at New York University. He has been connected with the First National Bank of Jersey City since 1882, being president in 1916-25 and later chairman of the board. He was State Comptroller of New Jersey (1911-17), member of the State Senate in 1919 (resigned), and Governor (1920-23). He was a member of the United States Senate for the term 1923-29; but was defeated for reelection.

**EGAN, MAURICE FRANCIS** (1852-1924). An American scholar and diplomat (see VOL. VII). From 1907 until 1918, he was United States Ambassador to Denmark. In addition to publishing *The Ivy Hedge* (1914) and *Ten Years on the German Frontier* (1919), he was a prolific contributor to leading American magazines.

**EGERTON, Eŷ'ĕr-ton, HUGH EDWARD** (1855-1927). An English historian (see VOL. VII), who was Beit Professor of Colonial History at Oxford (1905-20), and Fellow of All Souls College there. In 1923 he became a member of the International and Colonial Institute. Besides contributing to many historical publications, he wrote vols. iv and ix of the *Cambridge Modern History*, *British Foreign Policy in Europe* (1917), *British Colonial Policy in the 20th Century* (1922), and *Causes and Character of the American Revolution* (1923).

**EGYPT.** A kingdom in northeastern Africa since Feb. 28, 1922, when the British protectorate terminated. The total area of Egypt proper, including the Libyan Desert, the region between the Nile and the Red Sea, and the Sinai Peninsula, is about 383,000 square miles; but the cultivated and settled area, i.e., the Nile Valley and Delta, is but 13,000 square miles. The population for this section was, by the 1927 census, 14,168,756; this made a density of 1044 per square mile, an increase of 10.6 per cent over the last decennial census. The increase for 1897-1907 was 14.9 per cent. The largest towns had the following populations in 1927: Cairo, 1,059,824 (654,476 in 1907); Alexandria, 570,314 (332,246 in 1907); Port Said, 103,223 (49,884 in 1907); Suez, 35,547; Tanta, 89,712; Mansura, 62,815; Zagazig, 52,815; Asyût, 57,036. The 1917 census showed 11,623,753 Moslems, 850,670 Orthodox Christians (Copts), 47,564 Protestants, 107,531 Roman Catholics, and 59,581 Jews. The country had 238,661 foreigners and 452,263 nomads.

Elementary education is supplied by native schools called *Maktabs*. In 1927-28 the number of these receiving grants-in-aid and under government inspection was 2361, with 205,901 pupils and 5039 teachers; the number of those under immediate direction of the Government was 1719 with a total attendance of 208,787. Of

the latter 277 *maktabs* with 54,226 pupils were under the Ministry of Education. Attendance at 1330 *maktabs* was compulsory. The total number of schools under the control of the provincial councils in 1927, either through direct management or through grants-in-aid was 3899, with 339,999 pupils.

Egypt has besides "*Maktabs*," colleges of medicine, law, engineering, and agriculture, a military institution, special technical schools, secondary schools, higher primary schools, etc. Besides native schools, there are British, American, French, Greek, Italian, and other foreign schools. Much of the native agitation against British rule crystallized about the failure of the British to increase the facilities for education. After 40 years of British domination, it was pointed out, 92 per cent of the men and 99 per cent of the women were still illiterate. The British policy had been directed almost exclusively toward the furtherance of secondary education, and even here the equipment was inadequate. Because of the failure to found a State University, the natives sought instruction at the university of El-Azhar (Cairo), the chief centre of Moslem orthodoxy, and the anti-Occidental spirit which resulted was inevitable.

**Agriculture.** In 1926-27 the cultivable area of Egypt was reckoned at 8,270,788 *feddans* (1 *feddan* = 1.038 acres), of which 2,052,061 were uncultivated. About 62 per cent of the population is engaged on the land. The cultivation of cotton is the most important single activity; 1,574,000 acres were sown with it in 1927, as compared with 1,743,000 in 1909-13. The yield in 1927 was 1,252,000 bales, averaging 478 pounds net and in 1928 estimated at 1,491,000 bales. The Government frequently has had to take measures to restrict the acreage because of the neglect of food crops. For the years 1921-23, for example, only one-third of each holding could be planted in cotton. In 1927, 1,655,000 acres under wheat yielded 44,346,000 bushels, compared with a yield of 35,731,000 bushels in 1913-14; barley, 376,000 and 11,961,000 bushels (12,050,000 bushels in 1913-14); maize, 19,000 acres; and millet, 262,559. Thus, the food crops steadily declined in the face of the growing cotton culture. In 1929, 49,000 acres were under sugar cane, as compared with 50,000 in 1909-13. In 1913 the sugar export amounted to 5133 metric tons, valued at £79,068, and this increased in 1927 to 25,219 metric tons, valued at \$1,729,000. In 1913, 690,644,548 pounds of raw cotton, valued at \$127,310,414, were exported; in 1927, 731,291,000 pounds, valued at \$194,438,000. To supplement the Assuan Dam for the reclaiming of waste areas, a large irrigation project was developed including the raising of the dam by 6 meters and increasing the capacity of the reservoir from 1,065,000,000 cubic meters to 2,423,000,000 cubic meters. There was a barrage at Isnah, one at Assiout, and also one at Zifta. Further important irrigation work was undertaken and in April, 1927, a contract was signed for the construction of the barrage of Nag Hamadi, midway between the Assiout and Isnah barrages. The object of the barrage was to change the system of irrigation of 500,000 *feddans* of land west of the Nile from basin to perennial watering, thus doubling or trebling the number of crops per year. Through canalization, it was hoped also perennially to irrigate 115,000 *feddans* east of the Nile and add 300,000 *feddans* on the west to basin irri-

gation. The cost of the barrage was estimated at £E1,976,555. The work during 1927 was financed by a budgetary credit of £E250,000, and the budget draft for 1928-29 carried a credit of £E2,250,000 for continuation of the work on the barrage and on the canalization, which was expected to be completed around 1930.

**Mining and Manufacturing.** Principal mineral products in 1927 were, in metric tons, phosphate rock, 279,389; manganese-iron ore, 152,845; petroleum, 1,356,000 barrels. The increase in the last was particularly marked, for up to 1912 petroleum was hardly produced at all. In 1913 the output was only 88,000 barrels. The manufacture of cigarettes, the leading industrial activity, visibly declined after 1913. In 1927 the amount of tobacco imported for the making of Egyptian cigarettes was 14,830,000 pounds, as compared with 18,027,000 in 1913. Imports from China became important during the World War.

**Trade.** For 1913 imports were \$139,047,323; 1920, \$382,053,600; 1921, \$219,256,537; 1922, \$196,736,078; 1927, \$242,729,000. Exports for 1913 were \$157,993,704; 1920, \$320,501,479; 1921, \$143,606,445; 1922, \$221,172,538; 1927, \$243,428,925. The year 1922 was the first to show a normal condition since 1913 and a favorable trade balance was restored. In both 1920 and 1921, there were heavy adverse trade balances, but for 1922 the foreign trade showed a favorable surplus of \$24,436,460; in 1923, \$61,487,711, and in 1928 the favorable balance was \$26,595,335 including reExports. In 1913 this had been about \$19,000,000. Cotton continues in the place of leading prominence, its exports totaling 90 per cent of the entire export trade. Next in importance are cottonseed, refined sugar, cottonseed cake, cigarettes, onions, eggs, etc. Leading imports with value in Egyptian pounds (£E=\$4.9431) in 1928 were cotton and cotton textiles (£E6,484,782); wheat and wheat flour (£E2,158,737), coal (£E1,592,441), tobacco (£E1,358,849), and fertilizers (£E2,320,639). The fluctuations in flour imports showed something of the part cotton played in Egyptian economic life. Imports for 1913 were \$10,000,000; 1920, \$24,000,000; 1921, \$25,000,000; 1922, \$8,000,000; 1928, £E2,158,737. In 1913 Great Britain was the leading country of origin of Egyptian imports; it sent 30.5 per cent of the whole. The United States ranked ninth with 1.9 per cent. In 1927 the proportions were: Great Britain, 21.8 per cent; United States was fifth with 5.2 per cent. The last figures for the United States were a distinct falling off from the 1920 and 1921 proportions of 10.6 and 15.1. Proportions by countries of destination of Egyptian exports were, for 1913, Great Britain, 43.1 per cent, and the United States, 7.8 per cent; for 1927, Great Britain, 39.6 per cent, and the United States, 14.1 per cent. In 1919 and 1920 the United States proportions were 22 and 30 per cent. The American purchases of raw cotton are significant. In 1913, 66,712,453 pounds (\$12,188,240) were purchased; in 1927, 121,462,000 pounds (\$32,472,000). Alexandria handled 90 per cent of the total trade in 1913 and 90 per cent in 1927. Port Said and Suez handled 8.4 per cent in 1913 and 8 per cent in 1927.

**Communications.** No important railroad construction has been accomplished recently except the double tracking of the line from Cairo to Luxor in 1928 and previously the continua-

tion of the line from Salhia to Quantara, which joined with the line across the Sinai Peninsula to Jerusalem by a bridge over the Suez Canal. The bridge was removed in 1921 because it obstructed the Canal traffic. In 1924 a railway 217 miles long was begun, from Kassala to Port Sudan. Total mileage on Apr. 30, 1927, of state-owned railways (single and double track) was 2272 miles. There were also 854 miles of line operated by private companies. A line connecting Benha and Meneuf was completed in 1929. In 1919 the Ministry of Communication took over control of all railway, telephone, telegraph, post-office, port, and lighting facilities. Cairo and Assiut have wireless stations and an airport is located at Cairo.

**Finance.** In 1912 revenues were placed at £E15,900,000 and expenditures at £E15,400,000. During the War, deficits were evident for the first time in the country's financing, the 1914-15 preliminary budget showing an adverse balance of £E1,460,000. The fall in prices during the year left the very large deficit of £E15,800,000. In 1921-22 the accounts had been restored to their normal relationship, with an expenditure of £E37,747,000 and a revenue of £E41,803,000. For the fiscal year 1928-29, the budget estimates were £E37,532,000 revenues and £E41,532,000 expenditures. The reserve fund in 1928 amounted to £E35,000,000. In 1926 the amount of the public debt was £E91,977,000 (\$454,643,000). The 1927-28 budget carried £E4,798,000 for debt service. The National Bank, the bank of issue, had in circulation in January, 1928, notes to the value of £E27,500,000. The gold reserve in January, 1928, was £E3,800,000.

**History.** On Dec. 18, 1914, the empty suzerainty of Turkey was factually terminated when the British Foreign Office declared Egypt a British Protectorate, with Hussein Kamil replacing the Khedive Abbas Hilmi and taking the title of Sultan. Under the high commissionerships of Sir H. McMahon (1915-16), who succeeded Lord Kitchener, and Sir R. Wingate (1916-19) Egypt was put on a war footing. By 1915 some 40,000 British troops had arrived in the country. With the growth of a powerful British bureaucracy, under the new order, the failure of the Legislative Assembly to convene, the cruel treatment of native soldiers, the censorship of opinion, the suppression of native newspapers and of political discussion in the state schools, and finally the heavy requisitions of animals and produce imposed on the fellahin during the War, nationalistic aspirations were increasingly aroused and particularly the educated Egyptians were made restive. Two Nationalist leaders, Zaghlul Pasha and Adli Pasha Yeghen, made repeated but vain efforts to present their case to the British Foreign Office, and when Zaghlul Pasha was deported to Malta on Mar. 9, 1919, on order of the puppet sultan Ahmed Fuad (1917- ), serious disturbances ensued. Even the fellahin, much to the surprise of the British, joined in the disorders, and the Copts lined up with the Mussulmans. Riots broke out at Cairo and Tanta in March, 1919, and British soldiers, firing into the mobs, killed many. Railway lines were torn up, and Cairo was isolated as a result of the cutting of telegraph wires; Alexandria was the scene of popular disturbances; a British detachment was besieged by fellahin in Assuit; the Arabs were breaking in from the West.

Lord Allenby, appointed as special high commissioner in March, 1919, vainly attempted pacification but was met by a strike of officials at Cairo, with bloodshed again resulting. Zaghlul Pasha, now a popular hero, was permitted to return from Malta but the political strike continued and transportation was broken off. In April, 1919, Rushdi Pasha was invited to form a government once more but after two weeks his ministry, unable to handle the situation, resigned. Meanwhile Zaghlul had repaired to Paris to place his country's case before the Peace Conference; but he was never given a hearing, for President Wilson, on behalf of the United States, had recognized the British Protectorate within a short time of his arrival.

In December, 1919, a British mission headed by Lord Milner arrived in Egypt but was universally boycotted and after four months returned to England. There it negotiated with the Egyptian Paris delegation the so-called Milner-Zaghlul Agreement, providing for the recognition of Egypt as a constitutional monarchy, the right of Great Britain to defend Egyptian territory and maintain an army there, the naming of British financial and judicial advisers, the calling of a constituent assembly, the creation of a legislature, religious toleration, protection of the rights of foreigners, etc.

The agreement, however, was unfavorably received in Egypt and a new ministry, headed by Adli Pasha, selected a delegation to negotiate a new understanding. Zaghlul insisted that certain preliminary conditions should be accepted as a basis for these negotiations, and when they were refused he and his Nationalists opposed the Government and demanded the calling of a Legislative Assembly. Further riots in May, 1921, caused the British to suppress Nationalist newspapers and arrest agitators. The Egyptian delegation met with no success in London and the winter of 1921 saw a renewal of the disorders.

The arrest and removal of Zaghlul Pasha and 56 followers, first to Suez and then to the Seychelles Islands, whence Zaghlul was later transferred to Gibraltar before his release on Mar. 30, 1923, was followed by street fighting and another political strike on the part of government officials, together with the adoption on Jan. 23, 1922, of a policy of passive resistance. The seeming impasse and the visit of Lord Allenby to England to counsel the termination of the protectorate forced the hand of the British government, with the result that in February, 1922, Lloyd George made a unilateral declaration incorporating the termination of the protectorate, the abolition of martial law, security for the communications of the British Empire in Egypt, defense of Egypt against foreign aggression, protection of foreign interests and of minorities in Egypt, and guarantees of British interest in the Sudan. On Feb. 28, 1922, the protectorate was officially terminated; on March 16 the Sultan Ahmed Fuad was officially proclaimed King as Fuad I. On March 14, the English House of Commons approved the Government's Egyptian policy by a vote of 202 to 70. Under Rushdi Pasha, a commission set to work to formulate a constitution.

The new constitution promulgated in May, 1923, after many stormy preliminary sittings of the commission, contained the following provisions: Egypt is declared a sovereign, free, independent state with a hereditary, monarchical, and constitutional government; Islam is estab-

lished as the national religion and Arabic as the official language; compulsory free education for both sexes is assured; legislative power is vested in the King in consultation with the Senate and the Legislative Assembly; the King may declare war and make peace through a cabinet; parliamentary assent is needed for the declaration of offensive war, and all treaties of peace and alliance are ineffective without parliamentary ratification; the ministry is responsible to the Parliament; two-fifths of the senators are renominated by the King, and the remainder are elected; the Assembly is elected by universal manhood suffrage; the rights of the Egyptian Debt Commission and the Capitulations are not to be affected by legislation. Representation of racial minorities, greater freedom for women, the predominant position claimed by England in regard to Egyptian foreign relations and the military protection of the Suez Canal, all points of sharp contention, were not included in the constitution, nor was the question of the Sudan settled.

The Zaghlulists continued in opposition because of the failure of the constitution to incorporate a bill of rights. The unsettled internal affairs led to frequent changes of ministries. Sariwat Pasha resigned on Nov. 30, 1922, after holding office since March 1. Tewfik Nessim Pasha, his successor, was compelled to resign on Feb. 5, 1923, because of his willingness to relinquish the Egyptian claim to the Sudan. After a month of political bargaining, a new ministry was formed by Yehia Ibrahim Pasha on March 15. The turbulence in politics indicated with what dissatisfaction Egyptians still looked on the settlement. Feminism and a rampant nationalism which would accept nothing but complete independence were the order of the day, and rioting and outrages were only too frequent. The Egyptian government patterned an ineffectual attempt at retaliation after the methods of the British administration and instituted a rigorous censorship on May 31. The return of Zaghlul and the renewed activities of his executive committee made the campaign preceding the preliminary elections of September 27 bitter. Zaghlul's programme called only for Egyptian independence, and the wholehearted support which his party received showed how thoroughly the country, especially the rural districts, subscribed to the sentiment. As a result of the balloting conducted in September, November, and January, 1924, the Nationalist Party was returned with an extraordinary majority, 176 seats out of a total of 214. On January 17 Yehia Pasha resigned; and on January 28, Zaghlul, the outcast and political exile, saw his work crowned with success by the offer of the Premiership. He at once accepted, and in the first days of February he was installed in office amid great rejoicings. One of his first acts was to interrupt Howard Carter's excavations at the tomb of Tutankhamen (q.v.) and to put the work under the control of the Egyptian Department of Antiquities. In December, 1924, Howard Carter signed a contract to resume his work in 1925. See ARCHEOLOGY.

Consistent with his past record, Zaghlul proceeded at once to attempt realization of his programme, which was nothing less than the complete independence of Egypt, in domestic and foreign affairs alike, and recognition of the Sudan as an integral part of the country. But Ramsay MacDonald, the new Labor Prime

Minister of Great Britain, disappointed him by adhering to the policy of his predecessors. The primary object of that policy was the protection of the Suez Canal and the route to the East; but the dispute came to centre around control of the Sudan. The Egyptian Nationalists insisted that the Sudan was historically a part of their country, and that control of the waters of the Upper Nile meant control of the whole life of Egypt. This latter undeniable fact lay also at the bottom of the British determination to retain authority in the Sudan.

The Egyptian Parliament met on Mar. 15, 1924, and was almost unanimous in support of the Premier. In October, Zaghlul Pasha visited England to confer with Mr. MacDonald, but the two viewpoints proved irreconcilable and he returned with nothing accomplished. Shortly after his return, a band of conspirators, on November 19, assassinated Sir Lee Stack, Governor General of the Sudan and Sirdar of the Egyptian army, in Cairo. The reaction of the British government was swift and stern. Although the Egyptian authorities promptly disclaimed any connection with the outrage, Lord Allenby on November 22 presented to them an ultimatum from London demanding that the Egyptian government should (1) present an ample apology for the crime; (2) seek out and severely punish the criminals; (3) energetically put down all popular political demonstrations; (4) pay the British government immediately £500,000; (5) withdraw at once all Egyptian officers and purely Egyptian units of troops from the Sudan; (6) give notice that the area to be irrigated at Gezira was to be increased by the Sudan government from 300,000 feddans to an unlimited amount; (7) withdraw opposition to any measures the British might want to take for the protection of foreign interests in Egypt.

The Egyptian cabinet consented to the first four but refused assent to the Sudanese demands and temporized on the seventh. The British thereupon ordered the Sudan government to put the military and irrigation provisions into effect, and occupied the customs house at Alexandria. Zaghlul immediately resigned and a new Cabinet of moderates, headed by Ziwari Pasha, was sworn in and acceded to all the British demands. The Egyptian government appealed, without avail, to the League of Nations. On December 10, the British Foreign Office warned the Powers that the matter was purely a domestic one. The Egyptian Parliament was dissolved December 22 and elections ordered for early in 1925. They were held in March and resulted in a decisive indorsement of the Zaghlul party. When the new Parliament organized, by electing Zaghlul president of the Chamber, it was promptly dissolved and the Cabinet ruled for the rest of the year alone. The resignation of Lord Allenby and the succession of Sir George Lloyd were declared to be without political significance. A threatening dispute with Italy arose when the Egyptian government objected to the cession of the oasis of Jarabub, in fulfillment of a British promise of 1919, but the Italian claims were eventually conceded.

In the elections of May, 1926, the Zaghlulists were again overwhelmingly victorious. But Zaghlul was barred from the leadership by the British, and Adli Pasha formed a government, Zaghlul being again elected president of the Chamber. For a while, comparative political quiet prevailed, the Government occupying itself

with internal problems such as government economy, regulation of Nile waters, and restriction on cotton growing. An agreement was reached as to the amount of water that might safely be diverted for Sudan irrigation. On December 8, a law was passed limiting cotton acreage for three years to about one-third the 1926 area.

Among the non-political events in 1926 were the Caliphate Congress held in Cairo in May without decisive results, and the rejected offer by John D. Rockefeller, Jr., of \$10,000,000 for a museum to house Egyptian antiquities. In April, 1927, the extremists of the Wafd, or Zaghlul Nationalists, forced the resignation of Premier Adli and only Zaghlul's intervention prevented the overthrow also of his successor, Sarwat Pasha. When a Parliamentary committee recommended measures lessening British control the British government objected in a note, reinforced by battleships, and the Egyptians yielded.

King Fuad and Premier Sarwat visited London in July. On August 23, Nationalist aspirations received a severe blow in the death of Zaghlul, soul of the independence movement, at the age of 70. But his passing did not mean a cessation of the activities of his party. Mustapha Nahas Pasha took over the leadership, and on Mar. 16, 1928, became Prime Minister when Sarwat Pasha resigned, because of opposition to a proposed treaty with Great Britain providing, among other things, for stationing a British Army in Egypt for ten years, support of Great Britain by Egypt in case of war, British control of Egypt's foreign relations, etc. When this treaty was definitely rejected, the British government demanded that certain pending bills relating to public assemblies, election of village headmen, and the right to bear arms should not be passed, and when the Egyptians protested against this interference in their internal affairs, the British made the point that sovereignty in internal affairs could be exercised only when it did not conflict with British interests. Warships were sent and armed intervention was averted only by postponing action on the bills.

In June, 1928, Mustapha Nahas Pasha was dismissed by the King for personal irregularities and Mahmud Pasha succeeded him on June 27. On July 19 the King and the new Prime Minister took the drastic action of dissolving Parliament and suspending the constitution for three years. There was much protest by the Wafd, but the public seemed not dissatisfied. On Jan. 24, 1929, it was announced that Egypt had ratified the Kellogg anti-war treaty, and on February 16 that she would put into effect a new customs tariff at the end of one year. On March 21, a royal decree provided for the punishment of anyone inciting hostility to the existing régime or participating in prohibited demonstrations. In July, announcement was made in the British Parliament of the retirement of Lord Lloyd as High Commissioner for Egypt. In the middle of the year press reports described an agreement between Great Britain and Egypt relating to control of the Nile waters. It provided for the heightening of the Assuan Dam and the building of a new dam at Jebel Aulia, surveys for a dam where the Nile emerges from Albert Nyanza, and a canal through the region of the Sudd.

**EINHORN, MAX** (1862– ). An American physician and pioneer in gastroenterology, born in Grodno, Russia. After graduation from the gymnasium at Riga, he received the degree of M.D. from the University of Berlin in 1884, migrating shortly afterward to the United States. He was made professor of medicine in the New York Postgraduate School and Hospital in 1888. As a gastroenterologist, he has devised many new forms of apparatus for diagnostic or therapeutic work, which are known by his name. In addition to contributions to periodical literature, he has written several standard textbooks: *Diseases of the Stomach* (1896); *Diseases of the Intestines* (1900); *Practical Problems of Diet and Nutrition* (1905); *Lectures on Dietetics* (1914); *The Duodenal Tube* (1920, 2d ed., 1926; German transl. 1924).

**EINSTEIN, ALBERT** (1879– ). A great German-Swiss physicist and author of the special and general theories of Relativity (see RELATIVITY), born at Ulm, Württemberg. Einstein spent his youth in Munich, where his father controlled electro-technical works. He studied at the University of Zurich and supported himself by teaching at the Technische Hochschule. Einstein's next few years were years of painful struggle and gradual advancement. Tutor at Schaffhausen from 1900–01, he returned to Zurich for a year, and then became examiner of patents at the federal patent office in Berne. It was while earning his living as a government employee that Einstein published a paper on the "Electrodynamics of moving bodies" describing his special theory of relativity as a solution for the paradoxes of the Michelson-Morley experiment (1905). This theory embraced at the time only the interrelationships of space and time measurements, and it was while working out the problems and implications set by this theory that Einstein was led in 1916 to generalize his conception so as to include gravitational phenomena, and subsequently electromagnetism as well. In the meantime, having become a Swiss citizen, Einstein was called in 1909 to teach at the University of Zurich, and in 1911, to the University of Prague. The next year, however, he returned to the Technische Hochschule in Zurich with the title of full professor. By this time, Einstein's reputation had spread throughout the scientific world, and in 1913 he was invited to lecture before the Prussian Academy of Science. The next year, he received a research professorship without restrictions from the Kaiser Wilhelm Institut für Physik and the University of Berlin.

The outbreak of the World War found Einstein formulating specifically the general theory of relativity and indicating certain empirical tests. A revision of the complicated mathematical calculations enabled the theory in 1919 to account for the displacement of the perihelion of Mercury within 1 second of actual observations, where the theory of Newton had left a discrepancy of 42 seconds. The eclipse of the sun in May, 1919, as observed in Brazil, also confirmed the deflection of the sun's rays in the neighborhood of the solar mass as predicted by the theory. Einstein now leaped into world fame overnight, and was saluted as the greatest physicist since Newton. He visited England, the United States, Italy, and France, and in each country received great ovations and honors. On his return to Germany, Einstein busied himself with the problems of the quantum

theory of radiation, upon which he had published papers dating back to 1907. The phenomena covered by this theory concern the behavior of sub-atomic masses and at that time were considered outside the range of the relativity principle which provides continuous and invariant equations for systems of large masses. Quanta formed therefore the next objective of the Relativity theory, but it seemed to many scientists doubtful whether the Einsteinian principle could be extended to such phenomena without considerable modification. In 1929 Einstein published his remarkable work, *Zur Einheitlichen Feldtheorie*, giving unified field laws for gravitation and electromagnetism. This completed the unification of all fields involved in natural phenomena. In his extra-scientific life, Einstein was a fairly typical European intellectual. In politics, he was a liberal with socialist sympathies. During the period of political effervescence in Germany, he suffered from persecution at the hands of reactionary and anti-Semitic partisans, and threats against his life were reported. While he was in the United States, he took a public interest in the activities of Jewish Zionists.

Einstein's other published works include, in addition to numerous papers contributed to learned periodicals, the following books: *The Special and General Theory of Relativity* (Eng. trans., 1920); *Sidelights on Relativity* (Eng. trans., 1922); *The Meaning of Relativity* (containing the Princeton lectures delivered 1921); *The Principle of Relativity* (a collection of essays by Einstein and others, 1923); *Untersuchungen über die Theorie der "Brownschen Bewegung"* (1922). See PHYSICS; RELATIVITY.

**EINSTEIN, LEWIS** (1877– ). An American diplomat and author, born in New York, and educated at Columbia University. His first diplomatic post was as third secretary at the American Embassy in Paris (1903–05), and since that time he has been at the embassies of: London (1905–06); Constantinople (1906 and 1908); Peking, China (1909); Costa Rica (1911–13), as envoy extraordinary and minister plenipotentiary; Constantinople (1915), as special agent of the State Department; Bulgaria (1915–16), as American diplomatic representative in charge of British interests; and Czechoslovakia (1921– ), as envoy extraordinary and minister plenipotentiary. His works include: *Luigi Pulci and the Morgante Maggiore* (1902); *The Relation of Literature to History* (1903); *American Foreign Policy by a Diplomatist* (1909); *Inside Constantinople* (1917); *Prophecy of the War; Tudor Ideals* (1921); "Lewis Cass and American Diplomacy Under President Buchanan" (in *Lives of Secretaries of State*, 1927).

**EINTHOVEN, WILLEM** (1860–1927). A Dutch physiologist, born in Java and educated at the University of Utrecht, where he was assistant to the well-known physicists, Donders and Snellen. He was professor of physiology in the University of Leyden (1886–1927). His most notable achievement was the invention of the string galvanometer by means of which it became possible to register the numerous variations of the heart beat. For this, he received the Nobel Prize for Medicine in 1924. In the same year, he visited and lectured in the United States.

**EISELEN, FREDERICK CARL** (1872– ). An American seminary president and Methodist

Episcopal clergyman, born at Mundelsheim, Germany, and educated at the gymnasium in Landsberg, Germany, at New York University, Drew Theological Seminary, the University of Pennsylvania, Columbia University, and the University of Berlin. In 1902 he was appointed professor of Semitic languages at the Garrett Biblical Institute, Evanston, Ill., served as dean, 1919-24, and as president after 1924. He was professor of Biblical literature in Northwestern University, 1918-24. He is the author of: *Sidon—A study in Oriental History* (1907); *A Commentary on the Minor Prophets* (1907); *Prophecy and the Prophets* (1909); *The Worker and his Bible* (1909); *The Christian View of the Old Testament* (1912); *Books of the Pentateuch* (1916); *The Psalms and Other Sacred Writings* (1918); *The Prophetic Books of the Old Testament* (1923).

**EISELSBERG, ANTON, BARON VON** (1860- ). An Austrian surgeon, born at Steinhaus. He received his medical degree from the University of Vienna and was professor of surgery in the Universities of Utrecht (1893-96), Königsberg (1896-1901), and Vienna (1901- ). His only considerable work was *Krankheiten der Schilddrüse* (1901). In 1918 appeared his "Festschrift" which comprised vol. ex of the *Archives für klinische Chirurgie*, of which he is co-editor, and was made up wholly of papers by numerous prominent surgeons who were formerly his pupils.

**EISNER, KURT** (1867-1919). A German Socialist and publicist, born in Berlin. He became a journalist, and was many times imprisoned on account of the extreme radical character of his writings. From 1898 to 1905, he was a member of the editorial staff of *Vorwärts* in Berlin; he was subsequently on Socialist papers in Nürnberg and Munich. During the World War, he turned against his party because it supported the War, and in 1918 was charged with treason at Munich for inciting munitions workers to strike, but he was released. On November 7 of the same year, he held a mass meeting in Munich which led to the overthrow of the Bavarian monarchy and the creation of a revolutionary government with Eisner as president. His policy was extreme. He supported the Workmen's and Soldiers' Councils, and was opposed to the centralizing policy of the Berlin government. He finally agreed, however, to the reestablishment of the federal system and the election of a National Constituent Assembly. But in the meantime, a Bavarian Assembly had been elected. This fortified the fears of the reactionaries and as he was going to open the Assembly on Feb. 21, 1919, he was assassinated by Count Arno, and Munich was plunged for a time into a state of Bolshevism. **ELECTRIC DRIVE.** See **SHIPBUILDING**.

**ELECTRIC FURNACES.** A new type of furnace has come into general application so that now we have four types recognized: resistance, arc, induction, and coreless or high frequency.

The resistance type furnace employs a conductor of high resistance metal, such as nichrome or calorite as used in household heating appliances, maintained at a high temperature by current, either direct or (more generally) alternating. A usual size is designed for 1500

pounds of brass with 300 kilowatts. Temperature up to 1800° F. may be obtained.

Arc furnaces, particularly for steel, have developed rapidly in design and application. Alternating currents are more convenient because a transformer may be used for the supply instead of a motor-generator set. Single-phase furnaces are available, but, particularly in large sizes, the three-phase ones are preferable from the viewpoint of the balanced supply. A notable example of an arc furnace is that of the United States Naval Ordnance plant which holds 40 tons of steel and takes 3300 kilowatts, normally in the form of three-phase currents at 110 volts, with a maximum current of 21,200 amperes per phase. In the industries, three-phase furnaces of a rating as high as 20,000 kilovolt-amperes have been installed.

The induction furnace as used primarily for copper, brass, etc., is constructed like a transformer, using the metal to be melted as a short-circuited secondary and works at normal power frequencies. Sizes range up to 300 kilowatts. The repulsion-induction furnace is a special form in which the secondary is so placed that the leakage flux keeps the molten metal flowing by the eddy currents induced in it. The "core-loss," or high-frequency-induction furnace is for ferrous materials. The materials to be melted occupy the place usually assigned to the magnetic iron core in a transformer and are heated due to excessive eddy currents and core loss set up in them by the high frequency, usually from 500 to 2000 cycles per second, but sometimes as high as 12,000. The lower frequencies are supplied by motor-generator sets and the higher frequencies by oscillating tube sets. Consult N. R. Stansel, "Industrial Electric Heating" in *General Electric Review*.

**ELECTRIC GENERATORS.** See **ELECTRIC POWER STATIONS AND GENERATING APPARATUS; STEAM ENGINES AND TURBINES**.

**ELECTRICITY, THEORIES OF.** See **CHEMISTRY; PHYSICS**.

**ELECTRIC LIGHT AND POWER.** See **MUNICIPAL OWNERSHIP**.

**ELECTRIC LIGHTING.** The more striking achievements in the field of electric lighting since 1914 have been: the great improvement in the efficiency of the incandescent lamp and the increase in the intensity of illumination used in general practice. In this period, the old favorites, the carbon lamp and the metallized-filament lamp, have practically disappeared from the market, and the tungsten-filament lamp reigns supreme among incandescent lamps and also has superseded the arc lamp in new installations except for display effects. In 1919 the manufacture of the metallized-filament lamp was abandoned, and in 1927 only 4 per cent of the lamps made were of the carbon-filament type, the remainder were tungsten lamps. During 1928 a total of 312,000,000 large tungsten-filament lamps were sold in the United States, an increase of 2.3 per cent over the previous year, and 9,900,000 large carbon lamps, a decrease of 21.4 per cent from 1927. Of the carbon lamps, 77 per cent were imported and were distributed largely through chain stores.

These lamps, known to the trade as Mazda, now are made in two styles. In one, the Mazda B lamp gives 8 to 12 lumens per watt, in the C type, the bulb is filled with an inert gas such as nitrogen, or, more recently, argon. The B lamp is about three times as efficient as the

old carbon lamp, and the C lamp about four times as efficient. The C lamp was at first made only in the largest sizes; later it was made in all but the smallest standard sizes.

In keeping with the policy of reducing costs by standardization, these lamps now are made in only a few sizes, i.e., 15, 25, 40, 50, 60, and 100 watts of which the 50 watt and larger are of the gas-filled type. The number of standard voltages has been reduced so that 94 per cent of the lamps sold are for one of the three voltages, 110, 115, and 120, and 59 per cent are for 115 volts. The spherical-shaped, tipless lamp with inside frosting has also been standardized because this inside frosting reduces its efficiency so little that it may be used with success where either clear or frosted bulbs are called for. The outside frosted lamp was less translucent itself and accumulated dirt which rendered it still less efficient or required frequent washing. Along with these improvements, the selling price of the lamps has been reduced to 50 per cent of the price prevailing in 1914.

On account of the changes in the shape of the filament and in the distribution of the direction of the light from these newer lamps, it is no longer possible to compare lamps by candle power, which is an intensity in a definite direction. Therefore, the illuminating engineer has adopted a definite *quantity* of light as the standard of comparison and has called it the lumen. A lumen is most easily understood as the amount of light that would fall on a sheet of paper one foot square placed so that all parts of it were just one foot distant from a candle of one candle power. The paper would then be illuminated with an intensity called *one foot-candle*. Thus, lamps are now sold on the basis of the light they give in all directions instead of in only one direction, as formerly. A point source of light of one candle power gives 12.56 lumens. The average Mazda B lamp gives 8 to 12 lumens per watt, and the Mazda C from 12 to 18 lumens per watt. The old carbon lamp gave about 3.4 lumens per watt. Statistics show the growth of the use of large incandescent lamps and the improvement in their efficiency:

	1913	1927
Total lamps sold in year	105,000,000	315,000,000
Aggregate wattage	4,700,000,000	18,600,000,000
Aggregate lumens	29,500,000,000	238,000,000,000
Average lumen per watt	6.3	13.5

The effect of this improvement on the pocket-book of the consumer is demonstrated by the total expenditure for electric lighting in the United States in 1927; this was \$1,000,000,000 with the new high-efficiency lamp. If lamps of the low-efficiency type common 15 years ago had been used the bill would have been three times as much. The improvement of the incandescent lamp in the last 15 years means a saving of \$2,000,000,000 per year to the users. New York City alone pays a bill of \$4,000,000 annually for current for lighting its 2800 miles of streets.

Scientific measurements of the prevailing intensities of artificial illumination and of the most desirable intensities have shown that a very great increase is desirable, profitable, and, in some cases, necessary to the preservation of the eyesight of the nation. Thus, in schoolrooms, an illumination of three foot-candles would be considered good, but now eight foot-candles is recommended. Investigations in the industries

have shown that by multiplying prevailing intensities three times, the production of a factory may be increased 20 per cent. There is also a very close relation between industrial accidents and quality of illumination, and it is accepted that an increase in intensity in dangerous locations very definitely decreases the chances of accidents to industrial workers.

The Illuminating Engineering Society developed a Code of Standard Practice in Illumination which has had a beneficial effect in improving methods, and several States have adopted codes for the regulation of the illumination of factories, streets, schools, etc. A great deal of scientific work was done on the design of fixtures for incandescent lamps, and the name "lumenaire" was officially given to such devices. The main requirements are to direct the light uniformly in a desired way (downward) and to eliminate glare. Enclosed lumenaires are now the usual practice, and some sort of reflecting surface above or inside the lumenaire is used to throw the light downward where it is usually desired and most needed. In the scientific study of illumination, new measuring devices have been developed and various forms of illuminometers are in use. The foot-candle meter is a simple commercial device by which any person may determine the intensity of illumination at any given point, in foot-candles, as easily as he may tell time by looking at a clock.

While the tungsten-filament lamp is much richer in blue and green than the older types of lamps, it still falls far short of daylight in its color content. The gas-filled, or C, type is better than the vacuum lamp on account of the higher temperature of its filament. To overcome the defect in color, a special lamp is manufactured in which the bulb is tinted a bluish-green, which absorbs the excess of red and yellow of the filament and thus gives a reduced amount of light with a better distribution of colors. This is known as the daylight lamp. By means of outside screens, a real reproduction of daylight may be obtained with this lamp. This is found useful in matching colored cloths, and physicians employ it in examinations of inflamed internal membranes, as in the nose and throat.

To facilitate the making of moving pictures at night with better color effect than that given by the mercury lamp, a very large size of tungsten incandescent lamp has been developed which takes 30,000 watts, 1000 times as much as the usual lamp in the home; it gives a proportionate quantity of light. The high intensity gas-filled lamp has been adapted, by giving the filament a special shape which approximates a point source, to use in stereopticons and moving-picture machines for projection purposes. It is rapidly superseding the arc lamp on account of the reduced fire hazard.

The improvement in street lighting has been marked, both in intensity and in artistic effect. Artistic poles and lumenaires are now the rule instead of the exception and the various cities are competing for the reputation of having the finest lighted main street. In 1928 Chicago stood first with 2000 lumens per linear foot of street, while the average of good practice is from 500 to 800 lumens per foot.

Electric signs add much to the street illumination and the show effect. New York City is said to have electric advertising signs aggregating 25 million candle power. The lighting of airports and airways has received much atten-

tion. The boundaries of airports are now defined by special low-intensity luminaires, the field is illuminated by flood lights, and the routes are marked by high-intensity beacon lights every 10 miles.

A special study of home lighting has been made, many standard lay-outs have been produced, so that good illumination may be had in a large number of artistic settings. Many public utility companies maintain show-rooms for the education of the householder so that good illumination may be had in the home without sacrificing artistic or aesthetic tastes. Many of these have a distinctly modernistic trend in their artistic effect.

The neon gas-tube lamp without filament has been quite widely applied for sign and display lighting. These operate with alternating current at a fairly high voltage and are very economical in power consumption. Various colors are obtained by a choice of mixtures of gases. The hot-cathode neon lamp is a still later development. It gives a very brilliant light and operates on a 115 volt circuit with either direct or alternating current.

The realization of the importance of the ultra-violet light in sunlight to the health of the human body has led to the introduction of several sources of "artificial sun-light," that is, a light rich in the ultra-violet rays. The mercury arc in quartz tube is the most noteworthy of these. It gives a radiation having a wavelength from 220 to 320 millimicrons. Iron arcs also give these radiations and carbon arcs to a lesser degree. Used without knowledge, such devices often are dangerous.

The photoelectric cell has been very greatly improved in sensitiveness and size and is now a practical commercial device used in broadcasting television, in sound reproduction, talking movies, and in photometry. The later tendency is to use cesium rather than potassium as the light-sensitive metal. This is now applied to analyze the color of a source of light in an electrical device which serves as an automatic recording spectro-photometer.

**Bibliography.** Recent available works in this field are Barrows, *Light, Photometry and Illuminating Engineering* (New York, 1925); Croft, *Practical Electric Illumination*; Cady and Dates, *Illuminating Engineering* (2d ed., New York, 1928); *Transactions Illuminating Engineering Society* (New York, Current).

**ELECTRIC MOTORS IN INDUSTRY.** The steel mills of the United States gradually have been replacing their steam and gas engines with electric motors, even for driving the largest reversing rolling mills, which is the most difficult service to be provided in such plants. These are generally driven by direct-connected, direct-current motors receiving power from fly-wheel motor-generator sets which vary the voltage impressed upon the mill motor according to the Ward-Leonard system. The largest direct-current, mill motor is of 7000 horse power at 40 to 80 revolutions per minute. Many installations of three-phase, alternating-current, induction motors also have been made, even in still larger sizes. In case variable speed is required, the Scherbius system of speed control is used. In this, a large, induction motor is used to drive the load, and its secondary electric circuits are connected to a polyphase, alternating-current, commutator motor, which in turn drives an induction generator connected to the same

electric mains as the principal motor. By electrical control of the commutator motor, it is made to take more power from the secondary of the load motor, which therefore decreases in speed. This power is returned to the line by the induction generator. By adjusting the power taken by the commutator motor, the speed of the main induction motor may be controlled through a wide range without wasting the energy as would be done with rheostats.

There has been developed a scheme of automatic control of the speeds of all of the motors driving the various parts of a rolling mill so that the whole operation is automatic and in the hands of one man. Automatic control has been applied also to many large installations of one or more motors, as in paper mills, so that the operator has merely to press one button to start and another button to stop the whole machine. Considerable attention has been given to the "capacitor" type of single-phase induction motor, which gives a good starting torque and has a good power factor as a result of the use of an electric condenser.

**Mining.** The mining industry has shown a notable trend toward the substitution of electrical machinery for steam engines and the use of purchased power instead of isolated plants. An average of 40,000 horse power of new electrical motors has been installed annually, of which about 80 per cent was for operation on alternating currents. The mining industry is the third largest customer of the central stations. Mine hoists are the largest factor in size of motor and in power demand. Mining locomotives have increased in size to 35 tons and are now made with electro-pneumatic control, air brakes, dynamic braking, and all equipment sealed in to protect it from moisture and to reduce the danger of mine explosions. The Bingham Mine in Utah has changed to the use of electric shovels and electric locomotives. The bituminous coal mines are now using mechanical loading of the cars. A new double-filament incandescent lamp has been developed for the miner's cap, giving increased illumination and a reserve for reliability. The U. S. Bureau of Mines has issued a list of "Permissible Equipment" advising mine operators of equipment of various manufacturers which has been tested by the Bureau of Mines and been found satisfactory and safe for operation in mines.

**Mine Hoists.** All new hoists are electrically driven, and many old steam-driven hoists are being changed over to electric. Installations are of three kinds:

(a) Direct drive of the hoist by a large three-phase induction motor taking power from the supply lines. This is the simplest and cheapest arrangement, but puts a variable load on the electrical system. An example is that of the Tennessee Coal and Iron Company at Muscoda, Ala., in which an 1800-h.p., 2200-volt, three-phase motor superseded a steam engine in hoisting a load of 27,000 pounds up a slope of 5000 feet at a speed of 2700 feet per minute. For lowering, the motor is reversed electrically.

(b) A direct-current motor is used to drive the hoist, and this is supplied from an alternating-current, direct-current motor-generator set operating on the Ward-Leonard system, by which the control of the speed is most conveniently and economically accomplished. The set has a three-phase synchronous motor, which by

its good power factor assists in the voltage regulation of the distribution system. For example, the Vandalia Coal Company of Indiana has a number of such sets in which an 800-h.p., 500-volt, direct-current motor drives the hoist through gearing, and this motor receives its power from a motor-generator set having a synchronous motor operating from the alternating-current supply lines and driving a suitable direct-current generator. By changing the field current of this generator, the speed of the hoist motor is regulated. The 3200-h.p. motor operating on direct current at 79 revolutions per minute for the International Nickel Company is the largest of this type.

(c) The Ilgner-Ward-Leonard system, in which the motor-generator set contains an induction motor, a fly-wheel, and a direct-current generator. A speed controller so regulates the set as to cause it to take a fairly uniform amount of power from the supply lines while delivering a very variable power to the hoist motor. An example is the Cleveland Cliffs Mining Company of Michigan. The duty is to raise 12,000 pounds of iron ore per trip, up a lift of 2700 feet at a speed of 1800 feet per minute. One 900-h.p., direct-current motor drives the hoist and is supplied by a motor-generator set having a 30-ton fly wheel. The hoist motor takes, at most, 1700 h.p. from the set, a large part of which is supplied by the flywheel, so that the peak demand on the supply lines is only 960 horsepower.

The very general application of electric motors to hoists, cranes, loaders, etc., has resulted in important changes in the design and a great development in the machinery and its application. These devices have been built in much larger sizes than previously. One example of the magnitude which such apparatus has reached is the Baltimore & Ohio coal loader at Curtis Bay, Md., near Baltimore. This loader will unload 8000 tons of coal per hour from coal cars and deliver it to the hold of a ship at a somewhat slower rate. The coal is conveyed along the pier by eight parallel belts driven by electric motors, all controlled by one operator on the bridge of the pier. The coal is transferred automatically to transverse belts which drop it into the vessel alongside the pier. To fill the spaces between the hatches in the hold of the vessel, a trimmer is used. This trimmer throws the coal a distance of 50 feet, if necessary, and each trimmer handles 100 tons per hour. By this means, a vessel has been loaded with 9500 tons in 9.5 hours; this task would have required 200 men for 25 hours if hand trimming had been used.

**Electric Cranes.** Electric cranes are being built in very large sizes, as well as small, and are equipped with alternating-current motors or direct-current motors specially adapted for the purpose. An electric crane of unusual magnitude has been built for service in a shipyard. It has a maximum height of 230 feet, a length of boom of 300 feet and a hoist of 170 feet. It is capable of lifting loads of 350 tons. Several motors aggregating 300 horsepower are used for the various movements, all controlled from a central point. The electric car loader is a type of crane which will pick up a whole freight car and either dump its contents (as coal or grain) into the hold of a vessel or will lower the car itself into the vessel. An example of the former is that of the Baltimore & Ohio

R. R. at Baltimore, and of the latter, the equipment at New Orleans and Havana for loading complete refrigerator cars in and out of vessels. This will lift a 165-ton car at 50 feet per minute and uses two 250-h.p. motors for lifting.

**Electric Shovel.** Electric shovels are replacing the familiar steam shovels and are built in larger sizes than the steam shovels. A large-sized shovel is rated at 300 tons, has a bucket capacity of 8 cubic yards, and can be filled and emptied in 45 seconds. One man controls all the operations by means of two controllers, one for each hand, and foot pedals. It contains four direct-current motors for working, aggregating from 500 to 600 h.p. These direct-current motors are supplied by a motor-generator set in the cab consisting of a three-phase, alternating-current-synchronous motor for 4000 volts driving a 250-volt direct-current generator of suitable capacity. Electric shovels have been built to handle 12 cubic yards and there has been constructed a shovel for 15 cubic yards. This weighs 1350 tons, has two 450-h.p. motors for hoisting and a radius of action of boom of 100 feet.

**Electric Drills.** The enormous activity in the oil industry made it worth while to develop a standard electric-driven drill in which it is possible to use a three-phase alternating-current motor of from 50 to 100 h.p. to drive the drill by means of gearing and chain drive. The motor can take power from a cheaply installed transmission line tapping a main transmission system.

**Brush-shifting Motor.** A new adjustable-speed polyphase motor was brought out, known as the brush-shifting motor, in which the speed may be nicely controlled within a wide range by shifting the brushes. Its most general application was for blowers in power plants.

**Clock Motor.** An interesting development was the clock motor, a small synchronous motor for actuating clocks. It is connected with the alternating current mains of a central station in a customer's house, and as the frequency of the system is kept constant the clock runs at constant speed and repeats the time of a master clock in the power house. Averaged over 24 hours it will keep excellent time, but it may run a second to the minute fast or slow for short periods. In a form now used, the moving part is a disc of aluminium, as in a watt-hour meter, but this disc has small steel studs punched into it. These give it the synchronous tendency.

**Position Indicator.** The position indicator is a repeater which has had an important application on shipboard. It consists of one master and several repeater synchronous motors whose fields are supplied with single-phase alternating current and whose three-phase stators are connected in multiple and located at distant points. At whatever point in its angular position the master is set, the several repeaters will show accurately, and if the circuit is broken and re-established the repeaters will adjust themselves correctly. It is used in the control of the locks of the Panama Canal to indicate to the chief operator the position of each lock and it is being generally applied in the industry in connection with the remote control of apparatus and machinery.

**ELECTRIC POWER STATIONS AND GENERATING APPARATUS.** The business of the electric central stations has been increasing at such a rate that in the United States the

newer stations in the 400-pound class.

output of energy has almost doubled every five years. In 1928 three-quarters of all the power used in the industries was electrical and two-thirds of this electrical power came from the central stations. The growth is shown in the following table:

	1913	1928
Capacity in kilowatts	7,000,000	32,000,000
Output, millions of kw-hrs.	16,800	70,000
Gross earnings	\$337,000,000	\$1,909,000,000

The capital invested in these central stations is estimated in excess of 23 billion dollars.

Information for the year 1927 on the purchasers of this energy is as follows:

	Customers of kw-hrs.	Millions of kw-hrs.
Domestic	17,860,000	7,389
Commercial (small units)	3,441,000	10,580
Commercial (wholesale)	563,600	36,787
Other services	29,917	6,836
Total	21,894,517	61,592

The average rate to all consumers was 2.7 cents per kw-hr. Of this energy, 63 per cent was produced from fuels and 37 per cent from water power. By increased efficiency, the consumption of fuel has been brought down from 3 and 4 pounds per kw-hr. to less than 1.8 pounds in 1927. This growth in the use of electric power has exerted an important economic and social influence on this country by increasing the production of wealth and decreasing the cost of manufacture as a result of the increased substitution of mechanical power for manual labor. There is a direct relation between the mechanical horse power at the command of each wage earner and the amount and value of the product of his work.

	H.P. per Wage earner	Value of Product per year	Wages per year
1900	2.13	\$2,450	\$ 487
1914	3.25	3,460	590
1925	4.27	6,900	1,280
1928	5.	....	....

Figuring one horse power as the physical labor of 10 men, it can be seen that each wage earner in the United States is a foreman directing the work of 50 slaves. It is worthy of note that in Great Britain the allowance for power per man is about one-half that in the United States and the value of the product less than half, and that all other countries are behind Great Britain in this respect.

With the increasing cost of coal, it was found more economical to generate the electric energy in large central stations where the coal can be used most efficiently and where coöperation makes the load more steady, or, in technical phraseology, where the load factor is better. The same cause has resulted in a very notable increase in the number and size of the hydroelectric stations. These are generally operated in a system containing steam stations, and the load is allocated by a load dispatcher so that the most economical stations (hydro) operate all the time, and the less economical only carry the peak loads, or when the water flow is inadequate.

**Generators.** There has been a steady growth in number and size of steam turbo-generator sets and the practical extinction of reciprocating steam engines. In 1914 the limit was 40,000 horsepower in one set. In 1928 sets were installed having in one unit a rating of 94,000 kilovolt-amperes (125,000 h.p.) and under construction there were sets of 160,000 kva. (215,000 h.p.) and 208,000 kva. (280,000 h.p.), the former for New York and the latter for Chicago.

With the increase in size, there also has been a steady increase in the pressure and temperature of the steam used in the turbines. From 215 pounds gauge and 150° F. superheat, practice advanced in one step to 600 pounds and 725° F. maximum temperature and there are now machines in commercial operation at 1200 pounds pressure. This makes it possible to obtain one kilowatt-hour with 14,000 British thermal units of heat energy giving an efficiency of 24 per cent.

Many improvements were made in the design of the electric generator itself, so that this great increase in power capacity is obtained with only a small increase in the dimensions and weights. Recent generators weigh much less per kilowatt than those of 1914. This was made possible by pushing the peripheral speed up to about 25,000 feet per minute, by the use of mica insulation on the armature and asbestos on the fields, and by improving the ventilation. Efficiencies of 98 per cent and higher are common in these generators. A notable change in practice was the rapidly increasing use of closed-circuit ventilation. The air for cooling purposes, after passing through the generator and carrying off the heat, is sent through a radiator like that used on an automobile, except that the water cools the air,

Double-deck Compound Turbo-generator of Pacific Gas & Electric Co., of San Francisco, built by General Electric Co. There are two machines each rated at 50,000 kilowatts and operating at 1200 pounds steam pressure.

or the air is passed through a spray of water to which it gives up its heat, and then is returned in closed ducts to the generator to be used over again. The advantage of this is that no dust nor dirt is carried into the generator to clog its air ducts.

The development of a successful voltage regulator had a marked effect on the design of large alternating current generators; freed from the requirement of good inherent regulation in the machine, the designer has freer hand in his work and can economize in material. There was a steady trend toward 60 cycles as the standard frequency. It is now possible to obtain synchronous motors and converters of large sizes which will operate entirely satisfactorily at this frequency, so that the principal reason for choosing 25 cycles has disappeared.

As a result of the increase in the size of the generating units and particularly the increase in length, the type of set using a vertical shaft went out of favor and the horizontal shaft came into universal use. The improvements in the efficiency of these generating sets was so rapid that it was the rule to scrap a perfectly good set after a few years' use and buy a new and larger one, because the new one would require so much less coal in a year that the saving in cost of coal would more than pay the interest on the new set. Some of these large sets use \$1,000,000 in coal each year, so that a saving of 10 per cent is substantial. This is what is meant by obsolescence.

A feature of the development of steam turbines was the two-cylinder machine in which the turbine is divided into two parts, one for high-pressure steam and the other for low-pressure steam. Each part has its own generator, connected in parallel electrically, but independent physically. The same steam passes first through the high-pressure turbine and then through the low-pressure part to the condenser. This design is particularly desirable with the reaction type of turbine which has a tendency to be long and clumsy in dimensions.

In the design of power stations, a change to be noted was the smaller number and larger capacity of the units as a result of the greater reliability of the newer machines and also of economic conditions. Central stations cultivated off-peak load customers, such as those that use power many hours per day, and therefore improve the load factor of their stations; that is, they raised their average all-day load to approach more nearly their maximum peak load. On account of the very good efficiency of large sized units, as compared to smaller sizes, and a new business policy on the part of the central stations resulting in more reasonable rates, the isolated plant is becoming more and more rare. Almost all recent new buildings and industries obtain their electrical energy from a public-service company instead of installing an independent generating plant. The growth of hydroelectric stations was very great because of the high cost of coal. Many a station of this type which some years earlier faced bankruptcy showed a good profit when reorganized, and many new stations were built, although recent cost of construction has been almost double the 1914 figure. The size of generating units used increased rapidly. In 1916 the largest water-wheel generators in service were of 18,000 kw.; 1921, 32,000 kw., 1922, 45,000 kw., and 1924, 65,000 kw. The operating speeds were increased each year so that a 60,000-kw. machine of 1924 was not much larger than an 18,000-kw. machine of eight years previous. In 1928 there were none of greater capacity than 65,000 kw. (87,000 h.p.). The Conowingo Plant had seven generators of 40,000 kw. each running at 82 r.p.m. and, these, because of the low speed, were larger in bulk than heretofore built.

**Circuit Breakers.** With the growth in the size of power units and the increase of station capacities, it was necessary to develop larger and more powerful circuit breakers or switches to open the circuits in cases of trouble or excessive current. The type breaking the circuit under oil is most used where high voltages and

large power units are involved. The most noteworthy is one capable of interrupting 2,500,000 kilovolt-amperes in a 220,000-volt system. It weighs 85 tons. For lesser voltages the quick-break air switch is very generally used both for direct and alternating current, but particularly for the supply circuits in heavy direct current railway operation.

**Control and Protection of Circuits.** In 1914 the practice of protecting generators by inserting reactors or inductance coils in series with them to limit the current which would flow on short-circuit was new and not general. Ten years later every large station had several of these devices designed to limit the current to a certain definite maximum value. Some stations connected these in the generator leads as well as in the feeders; the latter was the more usual connection. The control and protection of large distributing systems was furthered by the development of relays accomplishing innumerable purposes indicated by their names, overload relay, low-voltage relay, reverse-current relay, time relay, etc. These were ingenious electromagnetic devices designed to open large circuit breakers when any one of these various phenomena occurred. One of the notable developments in electrical engineering is the increase in number and kinds of relays and their applications. A new type of switching equipment came into general use, the truck type safety switch. This is an oil switch mounted on a rolling truck and so arranged that when the switch is open, the switch and its truck may be rolled out into an open passageway, so that it is left entirely disconnected from all potential and is safe and convenient for inspection and repair. The phase balancer is a machine which was developed and installed in some large power systems. It is a special form of synchronous motor connected to the lines of a polyphase system; its function is to maintain a balanced load on the different phases of the generators even if the load on the system is very unevenly distributed between phases. This results in better voltage regulation and better generator efficiency.

As a matter of good economic policy, it was found desirable to interconnect all neighboring power systems, so that in case of an overload or an accident in one system, energy might be supplied by another. In the case of systems of the same frequency, this is done by transformers, but with two systems of different frequencies, e.g., 60 and 25, a frequency converter must be used. This may consist of two machines of like power on the same shaft, one having 10 poles for 25 cycles and the other 24 poles for 60 cycles, but this is an expensive arrangement. A new set was developed in 1923 consisting of a 37,000-kva. induction motor with 14 poles for the 60-cycle system and a 25,000-kva., 25-cycle synchronous motor with 10 poles. The induction motor takes power at 60 cycles and tends to run at 514 revolutions per minute but is held to 300 revolutions by the other machine. Thus the secondary of the induction motor generates power at 25 cycles, slip frequency, which may be turned into the 25-cycle system along with the power developed by the synchronous machine. In case the demand is in the opposite direction, the frequency of that system becomes slightly less than 60 cycles, and the induction motor becomes an induction generator and delivers power at the frequency of the system,

while the 25-cycle machine operates as a normal synchronous motor.

See POWER PLANTS; STEAM ENGINES AND STEAM TURBINES; WATER POWER.

**ELECTRIC POWER TRANSMISSION AND DISTRIBUTION.** In the war period and the years following, one of the most striking subjects of discussion in transmission engineering was the movement for the construction of a super-power transmission system, a forward-looking scheme for the combination of all producers and users of mechanical power in a given geographical district of the United States into one large electrical network. The advantages sought are reliability, secured by the ability of the various power houses to help each other out in case of accident to one; greater economy, through the use of most efficient stations all the time and the less efficient only when actually needed; better load factor, from less variable demand made by a greater number and variety of users in the system; shutting down of wasteful stations; reduction in the cost of fuel by concentrating the load at those places where fuel can be obtained most conveniently, and utilization of water power wherever practical. The plan contemplated several districts at first and a final interconnection of these districts as they spread toward each other. California was the heart of the first district where it went into actual operation. Here the plan was well under way in 1924, for on account of the scarcity of coal, the generation of power was in the hands of a few corporations which could cooperate readily.

Another interesting district was that of the North Atlantic States. Here it was proposed to install a 250,000-volt transmission line from Boston to Washington through New York, Philadelphia, and Baltimore, with possible branches to the coal fields of Pennsylvania. It was proposed that all the large generating plants in this district should connect up to the system and supply power, and that all the small plants of individual factories be shut down, since they could save money by buying from the large system. In his report to the Secretary of the Interior, W. S. Murray estimated that 10,000,000 h.p. was used in the industries in this district, and 7,000,000 h.p., by railroads; that the load factor of this power was about

15 per cent and that by combination this load factor could be raised to 50 or 60 per cent. This meant the 17,000,000 h.p. in use could be replaced by 6,000,000 h.p. properly located and controlled, and that 30,000,000 tons of coal could be saved each year and the railroads relieved of the congestion caused by the useless and uneconomic transportation of this coal. The same authority estimated that it would cost about \$1,250,000,000 capital to accomplish the change and that the resultant saving would be \$300,000,000 per year, or 24 per cent on the investment. This was for only one geographic district. The difficulty was to get so many different interests together and assure to each its share of the saving or gain.

Elevation of a high-tension line tower with strings of insulators, ring shields, and conductors.

**Transmission Lines.** The most important accomplishment in transmission engineering was the adoption of 220,000 volts as a working potential for transmission lines and the practical operation of two such lines. Previously, 165,000 was the highest potential used in regular practice. Two notable lines were installed in California. The Southern California Edison Company had a line 240 miles long installed and planned in 1924 to extend it. Incidental to the use of 220,000 volts as a working potential, the manufacturing companies built transformers for 1,000,000 volts for laboratory purposes to test out the apparatus to be used in the 220,000-volt lines. Transformers in sizes up to 16,000 kva., built for commercial purposes, were arranged with 130,000 volt high-tension windings for a Y connection on 220,000 volts with the neutral grounded. The line itself used large steel towers, eight to the mile, carrying the three conductors in a horizontal plane, hanging from strings of suspension insulators. Each string of insulators was protected by a static shield consisting of a metal ring surrounding and concentric

with the insulators. This ring was connected to the conductor and reduced the potential strain on the insulators by giving the electrostatic field a more uniform distribution. Authorities disagreed as to whether an overhead ground wire or lightning arresters were of any benefit on lines of this high potential. In the Southern California line, the conductors were 0.95 inch in diameter, were stranded aluminium cable with a steel core, and were spaced 210 inches apart. Experimental research indicated that with conductors of about one inch in diameter the loss from corona would not be important. The duplicate lines of 6 conductors were carried on two lines of steel towers so that the minimum clearance above ground was 30 feet. The insulators were of the disc-suspension type, 13 in each string, and shielded with rings.

The outdoor type of switching station became usual rather than exceptional. With the increase in the potential used the space required for the switches, circuit breakers, and lightning arresters became so great that it was expensive to put them in a building, and they could all be made water-proof. Oil-cooled transformers and water-cooled, oil-insulated transformers continued to lead the air-cooled in number of applications and were improved by the addition of a device known as the oil conservator, a reservoir attached to the oil tank and above it so that the transformer tank proper was always full and completely sealed from the atmosphere. This reduced oxidation of the oil, moisture in the oil, and the danger of explosive gases. The increase in length of transmission lines raised a serious problem in the regulation of the voltage and the power factor of the system. This was met by the use of synchronous condensers with relays controlling the field excitation to hold the voltage and power factor at predetermined values. In a 220,000-volt line, it was proposed to place such a device in circuit every 100 miles. Single units of this character of 30,000 kva. were placed in service. The use of the static condenser for alternating-current distribution circuits grew considerably. These were oil-insulated static condensers connected to the end of a distribution system to improve the power factor and voltage regulation of the system. They operated at about 2200 volts, and if the voltage of the system were much less than this, auto-transformers were used to step up the voltage.

The oxide-film lightning arrester was brought into quite general use. It consists of a number of units in series, depending on the voltage of the system, each unit constructed of two conducting plates separated by a short space filled with oxide of lead in the form of a powder, paste, or pellets. Ordinarily, this material is non-conducting, but an excess potential breaks through and allows a discharge current. This current heats the material in the small area through which it flows, and this heat changes the character of the material at that particular point into an insulator, thereby healing up the punctured spot. These are used for voltages up to 135,000.

The transmission of energy by underground cables, as in large cities, was improved by the use of improved insulating materials, resulting in the successful operation of cables at much higher potentials.

In 1914 the highest voltage was 13,000, but in 1927 several installations at 132,000 volts, three-

phase, were made using cables filled with oil as an insulating material and the level of the oil very nicely maintained by ingenious devices. Testing sets for experimental work and testing of insulation were developed so that a sustained alternating voltage of 2,100,000 volts was available and impulsive discharges from condensers known as lightning generators, as high as 3,600,000 volts were available. This method was also used for making artificial lightning in a general study of lightning protection, which has recently become the main difficulty in high-voltage, long-distance transmission. The cathode ray oscillograph was developed to aid in this study and this device makes it possible to record on a picture film the change in potential or current in the circuit, which lasts only a few millionths of a second. While 220,000 is the highest voltage in commercial use in the United States, in Germany one line operating at 380,000 volts has been put into operation.

The size of commercial transformers has been gradually increasing and has reached that of 40,000 kva. in one transformer at 132,000 volts and 28,866 kva. for use in 220,000-volt systems. These transformers have an efficiency of 99.5 per cent and greater. The use of voltage control of systems by changing taps on transformers has become very general. This is accomplished by having a number of taps on the low-voltage side of the transformer and an ingenious device which changes the connection of the line from one tap to another without short-circuiting any part of the transformer winding, and by means of relays this may be done automatically. Carrier current telegraphy and telephony has become quite general for the sending of orders and information from one part of the transmission system to another over the high-voltage power lines by means of radio-frequency currents or the so-called wired wireless. The message goes by a high-frequency current which is put on the power conductors by a capacity coupling which avoids any chance of a leak of the power current. This is really duplexing the power lines as done in telegraphy and telephony. In the distribution system, there has been a great activity in the development and perfection of the alternating-current distribution by means of special transformers, regulators, and protectors which make it possible to inter-connect the various distribution feeders for normal operation and maintain good voltage regulation and still be able to segregate automatically any circuit or transformer which develops a fault. With these improvements and the increasing reliability of the alternating-current distribution system, the distribution of electrical power by means of direct currents is being restricted to a smaller and smaller percentage of customers and even in some of the larger cities the direct-current distribution is being withdrawn and the alternating-current network is being substituted.

N. Y. Westchester & Boston	1911	27	SP
Great Northern	1909, 1928	26	SP
Detroit, Toledo & Ironton	1928	17	SP
Boston & Maine	1911	8	SP
Michigan Central	1910	5	DO
Lackawanna (projected)	1929	78	DO
Phila. & Reading (projected)	1929		SP

<sup>a</sup> DC = direct current. <sup>b</sup> SP = single phase.

The single-phase roads mostly operate with 11,000 volts on the trolley. Some use single-phase motors, some (Norfolk & Western and Virginian Railway) use a single-phase trolley, a phase-splitter, and three-phase motors, while some use direct-current motors supplied by a motor-generator set on the locomotive (Great Northern). The later direct-current roads use a high voltage on the trolley, 3000 volts in the case of the St. Paul.

In other countries, Mexico, Brazil, and Chile are using high-voltage direct current; Germany, Norway, Sweden, and Switzerland favor the single-phase while Italy has about 600 route-miles of three-phase railroads.

The Norfolk & Western is typical of the American alternating-current roads. This covers the division from Bluefield to East Vivian, W. Va.; the service consists of hauling coal trains of 3250 tons up a 1.25 per cent grade at a speed of 14 miles per hour, requiring 3200 h.p. at the locomotive. Twelve electric locomotives of 264 tons replaced 33 steam locomotives of the Mallet type. The electric locomotives take current at 11,000 volts, 25 cycles, single-phase, from an overhead trolley. This is converted to three-phase current by a phase converter on the locomotive and supplied as such, at a suitable voltage, to the three-phase induction motors which drive the locomotive. The merit of the combination was that the three-phase motors are more efficient than single-phase motors; they are constant speed motors which will regenerate power on down-grades automatically at a definite speed and thus act as brakes; finally, by means of this converter, a single overhead trolley may be used to supply three-phase motors.

The St. Paul Railway put into operation a section of 440 miles in Montana in 1917 and a second section of 220 miles in Washington in 1920. The first includes the heavy mountain grades of 2 per cent. Both are equipped with an overhead trolley operating at 3000 volts direct current, from which the electric locomotives of 290 tons take current. These locomotives are capable of hauling trains of 2500 tons up the grades at 16 miles per hour, giving 3000 h.p. continuously, and each locomotive makes the entire run of 440 miles without change or lay-off. The train crews are changed in the middle of the run. The locomotives also use regenerative electric braking when descending grades; that is, the electric motors act as gen-

erators, hold the train at a desired speed, and return the energy of the descending train to the line to be used elsewhere. This railroad takes its electric energy from existing public-utility companies, which in turn derive it mainly from water power. In Norway and Sweden, the single-phase system has been considerably extended, and in Italy the three-phase system has been further developed and extended.

Among urban street railways, the rapid and general adoption of the light-weight or one-man safety car was the outstanding feature. This is a very light car of moderate passenger capacity, usually having two motors of 20 h.p. The car doors are arranged to open and close automatically, interlocking with the control of the motors so that the car cannot be started until all doors are safely closed. With this precaution, it is safe for one man to act both as motorman and conductor; this reduces the cost of labor, and the light weight reduces the power required.

The development of the automatic substation was an achievement of the period succeeding the World War, and the increase in its use was phenomenal. It was employed in many applications and industries, but its most general and important field was the electric railway. This is a substation for the conversion of the high-voltage alternating-current power of the transmission line to the low-voltage direct-current power of the trolley or third rail. The station contains transformers, converters, and switches, operated by relays so that the machinery is started up just when it is needed and shut down when the demand has ceased, without the intervention of any human labor. The relay controls all the operations. An inspection of a few minutes each day is all the human attention the station requires.

There have been many installations (1926-28) in which mercury-arc rectifiers have taken the place of converters. These rectifiers have no moving parts, are much smaller and less expensive and at high direct-current voltages are more efficient than the converters. As they are still in the status of development, they are not yet made in the larger capacities, and have still to prove their superiority.

The high-speed or quick-break switch has been very successful in railway substations. In case of trouble in any line, it disconnects that line before it has caused trouble in any of the substation apparatus.

Some interesting tests were made at Erie, Pa., in the fall of 1923 to determine the maximum current which can be collected from an overhead trolley and the limit to the power of a locomotive on such a system. Currents of 4000 to 5000 amperes were collected at speeds of 50 to 60 miles per hour from two No. 000 wires by one pantograph trolley pressing upward at a pressure of 35 to 40 pounds. With 3000 volts on the trolley, this is equivalent to about 20,000 h.p. per locomotive.

Diesel-electric locomotives and self-propelled gas-electric cars have become very popular as they operate electrically without the use of an overhead trolley, a third rail or a power station. The power is supplied by either a Diesel engine or an ordinary automobile gasoline-engine driving a generator on the car structure. A new bus-type street car has been brought out which has many of the characteristics of a large bus but runs on a track, derives its power from an

overhead trolley, and uses electric motors driving the axles through a worm drive as used in automobiles. This gives better riding qualities and higher speed, hence less expensive, motors.

**Bibliography.** Consult Morison, *Railroad Electrification* (New York); Healy, *Electrification of Steam Railroads* (New York, 1929); Richey, *Electric Railway Handbook*, (New York); *Transactions of the American Institute of Electrical Engineers* (New York); *General Electric Review* (Schenectady). See RAPID TRANSIT.

**ELECTRIC SHIP PROPULSION.** The art of propelling ships by electric motors had practically its entire development after 1913, when the first vessel so equipped, the American collier, *Jupiter*, was put into commission. She had two 3000-h.p. three-phase induction motors on twin propeller shafts deriving their power from one steam turbo-generator of 5450 kilowatts. At the time of the Naval Disarmament Conference, the United States had built and under construction 20 electrically propelled vessels, mostly of the largest size, 30,000 tons each. Many of these were discontinued, but the U.S.S. *New Mexico*, *Tennessee*, *California*, *Maryland*, *Colorado*, and *West Virginia* were completed. These battleships remained in commission. Each of them had four propeller shafts and four motors aggregating 32,000 h.p. Under construction were airplane carriers having 180,000 h.p. of electric motors per ship. The battleships all use changeable pole induction motors capable of operating at two different speeds, usually 16 and 21 knots. As an example, the *Maryland* had two electric generators of 13,000 kilowatts each, driven by steam turbines at 2000 revolutions per minute. Her four propeller shafts were each driven by an induction motor rated at 7000 h.p. at 175 r.p.m. with 24 poles for 21 knots speed, and 1700 h.p. at 118 r.p.m. with 36 poles for 16 knots. One of the important advantages of electric propulsion for such vessels is the ability to reverse any propeller with full power at a second's notice. Steam turbines alone cannot be reversed so quickly or with so much power. The ability to operate conveniently and efficiently at two different speeds is another point in its favor, and the light weight and good efficiency obtained by the use of the high-speed turbines is a third.

More recently, the U. S. Navy Airplane Carriers, *Saratoga* and *Lexington*, have been placed in service. These are sister ships of 35,000 tons having 180,000 h.p. in eight electric motors. The *Lexington* has made a record of 34.82 knots in a test and a sustained speed of 30.7 knots in a run of 2228 miles from Los Angeles to Honolulu. There are now three merchant vessels, the *Virginia*, *California*, and *Pennsylvania*, of 30,000 tons each, equipped by the General Electric Company which run regularly between New York and San Francisco. See SHIPPING.

A development particularly adapted to freight vessels was the use of Diesel engines driving electric generators which in turn drive the motors on the propeller shafts. The Diesel engine is difficult to start, to reverse, and to build in large sizes. With the electric system, any number of units may be used, connected into an electric system, and the engines may run continuously in the same direction, the stopping and reversing being done at the motors. A large number of ferryboats are operated with

**ELECTRIC SHOVELS.** See ELECTRIC MOTORS IN INDUSTRY.

**ELECTRIC SUBSTATIONS.** The development of apparatus for substations kept pace with other advances. Synchronous converters were built, of larger capacity and for higher speeds, and the weight per kilowatt decreased. The improvement in 60-cycle converters was notable. The substation for converters or motor-generator sets was revolutionized; it was made independent of all labor for attendance. By the development of ingenious relays, these automatic substations start up when needed; the machines are brought up to speed, synchronized with the supply system, and connected to the load circuit. This idea was first put into effect in 1916 and hundreds of such stations have been installed since then, in sizes up to 4000 kilowatts and for voltages up to 3000 on the direct-current side. This idea was first introduced in the electric railway systems (see ELECTRIC RAILWAYS) and was so successful that it was adopted for industries, mines, and even small isolated water-power plants forming part of a system. Thus, it is possible to place a water-power station in some out-of-the-way place where hydraulic development is cheap, have it feed current into a system when power is desired, and yet have it require no attendants in the station. An inspector visits these stations regularly and tests them out; that is all the attention required. A water-power station of this character for 100,000-kw. capacity was installed near Louisville, Ky.

**ELECTRIC THEORY.** See CHEMISTRY; PHYSICS.

**ELECTRIC WELDING.** The uses of electric welding became so important during the World War that the United States Government fostered a special organization to study and develop the art. Under this stimulation, research was carried on, new methods devised, and new applications found. A large part of the repair work on the German steamers interned in 1914 and taken over by the United States in 1917 was done by electric welding. Ships were built in which welding was substituted for riveting. Electric generators were devised which so regulated the current as to give a uniform character of weld. While most of the welding was done with direct current, alternating current also could be used. Welded or, as technically called, "fabricated" structures have taken the place of castings to a very large extent in the manufacture of machinery, particularly electrical machinery; trucks, buildings, and bridges are now being built by electric welding instead of riveting.

**ELIOT, THE RT. HON. SIR CHARLES (NORTON EDGUMBE)** (1864- ). An English diplomat and Orientalist (see VOL. VII). He was British High Commissioner in Siberia (1918-19), and British Ambassador to Japan (1919-20). He was made Privy Councillor in 1919,

Knight of the Grand Cross of St. Michael and St. George in 1923, and a member of the Imperial Academy of Japan in 1926. He wrote papers on marine biology and published *Hinduism and Buddhism* (1921).

**ELIOT, CHARLES WILLIAM** (1834-1926). An American educator (see VOL. VII). He favored the League of Nations and was a strong supporter of President Wilson and his administration. In his writings and lectures, he has stressed in particular his condemnation of the standardization of education and industry. He was presented with a medal for distinguished service by the National Council of Civic Reform in 1923. He published *The Road Toward Peace* (1915), and *A Late Harvest* (1924).

**ELIOT, SAMUEL ATKINS, JR.** (1893- ). An American theatre director and teacher of drama, born in Denver, Colo., and educated at Harvard University. He studied the German and English theatres and went on the stage with Miss Horniman's Repertory Company in England. In 1914-15 he was play reader and stage manager for Winthrop Ames in New York. In the latter year, he joined the Washington Square Players; in 1916-17, directed the Indianapolis Little Theatre and in 1917-18, the Cincinnati Art Theatre. He became assistant professor of English at Smith College in 1918 and has been associate professor since 1926, giving courses in drama and producing plays. Since 1924 he has directed the Studio Theatre, New York City. He wrote books on the theatre and made many translations from Wedekind. His works include *Little Theatre Classics* (3 vols., 1918-21), *Erdgeist* (1914), *Pandora's Box* (1914), and *Tragedies of Seneca* (1923). The three last are translations.

**ELIOT, THOMAS STEARNS** (1888- ). An American poet and critic, born at St. Louis. He studied at Harvard, the Sorbonne, and Oxford. From 1913 on, he made his home in London. He attracted attention with his *Poems* (1920), containing some of the best pieces of the decade, and *Waste Land*, also a poem (1922). He was preëminently an ironist and his mocking, possibly only clever, poems stirred and antagonized the modern literary world. In spite of its obscurities, pedantries, and often perverse symbols, *Waste Land*, with its feel of the aridity of the modern life and its fine poetical passages, was a memorable work. Mr. Eliot's critical studies were considered by some even more noteworthy than his poetry. His *Sacred Wood* (1920) shows the first English attempt, since Matthew Arnold, to formulate a thoroughgoing aesthetic creed applicable to literature and life. In 1922 he became the editor of the *Criterion*, a finely balanced periodical devoted to the arts. An edition of *Poems, 1909-25*, appeared in 1925. His other works are *Homage to John Dryden* (1924); *An Essay of Poetic Drama* (1928); *Shakespeare and the Stoicism of Seneca* (1928), and *For Launcelot Andrewes* (1928).

**ELIZABETH.** A manufacturing and residential city of New Jersey. The population rose from 73,409 in 1910 to 95,733 in 1920, and to 115,000 in 1928, according to local estimate. An ordinance was adopted in 1922 zoning the city into three residential, three business, and three industrial districts. In 1924 a city-planning commission was appointed to develop a comprehensive plan for future growth. The city has 238 manufacturing establishments and eight banks, including two savings banks. In 1926 a

four-track bridge of the Central Railroad of New Jersey was erected over Newark Bay between Bayonne and Elizabeth at a cost of \$15,000,000. The assessed valuation of property in 1927 was \$149,207,000; the net debt was \$4,873,000.

**ELIZALDE, RAFAEL HECTOR** (1873- ). A diplomat of Ecuador born at Guayaquil, and educated at the National College of San Vicente del Guayas and the University of Guayas. He was a member of Congress, served in various South American embassies, assisted in the settlement of the boundary line between Ecuador and Colombia, was minister of foreign affairs (1914-16), and from 1917 to 1924 was minister to the United States and Cuba. In 1925 he returned to the United States to seek recognition of the de facto government of Ecuador. From 1925 to 1928, he was minister to Chile. He wrote *Labores Diplomáticas* (1912), *Organización de Partidos Políticos* (1913), and *Riqueza Obliga* (1914).

**ELLIOTT, EDWARD** (1874- ). An American lawyer, professor, and banker, born at Murfreesboro, Tenn., and educated at the universities of Princeton, Berlin, and Heidelberg. From 1898 to 1915, he was successively instructor in Latin and jurisprudence, preceptor in the department of history, politics, and economics, and professor of politics at Princeton University. He was also dean of the college from 1909 to 1912. In 1913 he went to the University of California as lecturer on international law, and from 1916 to 1920 was professor there. From 1917 to 1920, he was director of the Federal Reserve Bank of San Francisco, and in 1921 became vice president of the Security Trust and Savings Bank of Los Angeles. He wrote *Die Staatslehre John C. Calhoun* (1903); *The Biographical Story of the Constitution* (1910); *Selected Documents in International Law* (1914); *American Government and Majority Rule* (1915); *State Bank Membership in the Federal Reserve System* (1919).

**ELLIOTT, HOWARD** (1860-1928). An American railway official (see Vol. VII). In 1913 he was appointed president of the New York, New Haven & Hartford Railroad Co., where he served until 1917, when he resigned and was made chairman of the Commission on Intercorporate Relations for that road. In 1918 he was elected president of the Northern Pacific Railway, serving until 1920, when he was made chairman of the board of directors. During the World War, he was a member of the special committee on national defense of the American Railway Association. He was active in the American Railway Association and was a director of many large railway and financial corporations. He was president of the board of overseers of Harvard University in 1925, and was also president of the alumni association. He was a life member of the corporation of the Massachusetts Institute of Technology. Middlebury College conferred the degree of LL.D. on Mr. Elliott in 1916.

**ELLIS, HENRY HAVELOCK** (1859- ). An English psychologist and author (see Vol. VII). Among his later works are *The World of Dreams* (1911); *The Task of Social Hygiene* (1912); *Impressions and Comments* (1914; second series, 1921; third series, 1924); *Essays in Wartime* (1916); *The Philosophy of Conflict and Other Essays* (1919); *Little Essays of Love and Virtue* (1922); *Kanga Creek, an Australian Idyll* (1922); *The Dance of Life* (1923); *Sonnets with Folk Songs from the Spanish* (1925).

Consult *Havelock Ellis; Philosopher of Love*, by Houston Peterson (1928).

**ELLIS, WILLIAM THOMAS** (1873- ). An American journalist and author (see Vol. VII). In 1917 he spent six months in Russia and in the year following was correspondent on the Persian, Caucasus, Rumanian, and French fronts. He was special correspondent for the New York *Herald* and associated newspapers in the Balkans (1919), for the Chicago *Daily News* and associated newspapers at the Conference on Limitation of Armament at Washington, D. C. (1921-22), and for the *Saturday Evening Post* and other magazines in the Near East (1923). He is the author of *Billy Sunday—the Man and His Message* (1917); and *Bible Lands To-Day* (1927).

**ELLWOOD, CHARLES ABRAM** (1873- ). An American sociologist (see Vol. VII). He published *The Social Problem* (1915, 1919), *An Introduction into Social Psychology* (1917); *The Reconstruction of Religion: A Sociological View* (1922); *Christianity and Social Science* (1923); *The Psychology of Human Society* (1925); *Cultural Evolution* (1927). Several of his works have been translated into other languages.

**ELMIRA COLLEGE.** An institution for women at Elmira, N. Y., founded in 1852 and operated under its present charter since 1855, is the first college for women to give degrees upon completion of a course the equivalent of that offered in colleges for men. The enrollment for the year 1927-28 was 595, and for the year beginning in September, 1928, it was 588. The faculty numbered 55. The endowment of the college in 1928 was \$776,644 and the income for the year 1927-28 was \$450,174, as compared with an endowment of \$134,572 and an annual income of \$76,635 in 1914. The library during the same period was increased from 11,000 to 28,275 volumes. Between 1914 and 1924, 10 new buildings were erected and the campus was enlarged; in 1926 a library costing \$346,968 was dedicated, and in the autumn of 1927 a dormitory costing \$424,000 was opened for occupancy. President, Frederick Lent, Ph.D., D.D., LL.D.

**ELY, HANSON EDWARD** (1867- ). An American soldier, who was born at Independence, Iowa, and graduated at the U. S. Military Academy in 1891. He served in Montana, North Dakota, and Nebraska (1891-97), was professor of military science at the State University of Iowa (1897-98), and then served two years in the Philippines, for a time in command of General Funston's mounted scouts. After an interval in other service, he returned to the Philippines in 1907 and remained five years. Arriving in France as a colonel in the summer of 1917, he was in command of the 28th Infantry when it captured Cantigny in the following year and led the 5th Division, 3d Army Corps, A.E.F., in forcing the Meuse crossing. He was decorated with the D.S.C. and D.S.M. and was made Commander of the French Legion of Honor. He was promoted to brigadier general in 1921 and placed in command of the General Service Schools and Post at Fort Leavenworth (1921-23); was commander of the Army War College at Washington, D. C., with the rank of major general (1923-28), and later was in command of the 2nd Army Corps Area with headquarters at Governors Island, New York Harbor.

**EMBRYOLOGY.** See ZOOLOGY.

**EMERGENCY FLEET CORPORATION.** See SHIPBUILDING; SHIPPING.

**EMERSON, JOHN** (1874— ). An American playwright and producer born at Sandusky, Ohio, and educated in Chicago and New York. He acted and produced plays for Daniel Frohman, William Harris, the Shuberts, Clyde Fitch, and others until 1910. He wrote and played in *The Conspiracy* (1912) and *Step Lively* (1913). He wrote and produced motion pictures for D. W. Griffith, Douglas Fairbanks, Mary Pickford, Constance Talmadge, and others until 1922, and later formed the Emerson-Loos Company, writers and producers of motion pictures.

**EMERTON, EPHRAIM** (1851— ). An American historian (see VOL. VII). He became president of the Cambridge Historical Society in 1921. Since 1914 he has published *Beginnings of Modern Europe* (1917), *The Defensor Pacis of Marsiglio of Padua* (1920), *Learning and Living, essays* (1921), and *Humanism and Tyranny: Studies in the Italian Trecento* (1925).

**EMERY, HENRY CROSBY** (1872-1924). An American economist (see VOL. VII). In 1916 he went to Russia to make a study of the commercial, industrial, and financial conditions there for the Guaranty Trust Company of New York City, and was returning in March, 1918, when he was taken prisoner in the Åland Islands by the Germans. On Oct. 22, 1918, he was released. From 1921 to 1924, he was manager of the Peking, China, branch of the Asia Banking Corporation with headquarters in New York.

**EMMET, LYDIA FIELD** (1866— ). An American portrait painter (see VOL. VII). She was awarded the Philadelphia Prize of the Pennsylvania Academy of Fine Arts in 1915, the Corcoran Popular Prize in 1917, the Maynard Prize of the National Academy of Design in 1918, the Popular Prize at the Newport, R. I., Exhibition in 1921, the Newport Popular Prize in 1923, and the Philadelphia Bok Prize in 1925. She has been a member of the National Academy of Design since 1912.

**EMMET, WILLIAM LEROY** (1859— ). An American electrical engineer and inventor, born at New Rochelle, N. Y. He was graduated from the United States Naval Academy in 1881, left the Navy in 1883, but rejoined it during the Spanish-American War. He was with the General Electric Company after 1892. He made important inventions in connection with steam turbines and invented the mercury-vapor power process. The Edison medal was awarded to him in 1919, and the Elliott Cresson Medal in 1920. He was a member of the Naval Consulting Board in 1915. He wrote *Alternating Current Wiring and Distribution* (1894), and contributed articles to the technical magazines on electrical and mechanical subjects.

**EMMONS, WILLIAM HARVEY** (1876— ). An American geologist, born at Mexico, Mo. He was graduated at Central College, Fayette, Mo., in 1897, and received his Ph.D. at the University of Chicago in 1904. After serving as an aid in the United States Geological Survey during 1904-06, he returned to the University of Chicago, where he remained until 1912, having been advanced to the associate professorship of economic geology in 1909. After that time, he was professor of geology and head of the department at Minnesota, and director of the Minnesota State Geological Survey. His principal investigations involved a genetic classification of minerals, the ore deposits of various mining districts in Nevada, Montana, Colorado, Maine, and New Hampshire. He published im-

portant reports in the United States Geological Survey series, on regionally metamorphosed ore deposits and the segregated veins, as well as petroleum geology. He served on the United States Geological Survey as assistant geologist during 1906-10 and as geologist, 1910-15, and was, besides, an associate editor of *Economic Geology*.

**EMPLOYER'S LIABILITY.** See WORKMEN'S COMPENSATION.

**EMPLOYMENT BUREAUS.** See LABOR LEGISLATION.

**ENDOCRINOLOGY.** See SECRETIONS, INTERNAL.

**ENELOW, HYMAN GERSON** (1877— ). A Russo-American rabbi born in Russia, and educated at the universities of Chicago and Cincinnati, and the Hebrew Union College, Cincinnati. He became rabbi of Temple Emanu-El, New York, in 1912. During the World War, he served overseas as commander and general field secretary of the Jewish Welfare Board (1918-19). Among his works may be mentioned *Aspects of the Bible* (1911); *The Jewish Life* (1915); *The Synagogue in Modern Life* (1916); *The Faith of Israel* (1917); *The War and the Bible* (1918); *The Adequacy of Judaism* (1920); *The Jew and the World* (1921); *The Diverse Elements of Religion* (1924).

**ENEMY ALIENS.** See UNITED STATES, under *History*.

**ENESCO, GEORGES** (1881— ). A Rumanian composer and violinist, born at Cordaremi. When only seven years of age, he was admitted to the Vienna Conservatory, where he studied under Hellmesberger (violin) and R. Fuchs (composition) until 1893. He then entered the Paris Conservatoire, continuing the violin under Marsick and composition under Fauré and Massenet, at the same time acquiring more than ordinary proficiency on the 'cello, piano, and organ. After graduating in 1899 as winner of the first prize for violin, he made a very successful concert tour and was appointed court violinist to the Queen of Rumania. His talent for composition showed itself early. In 1897 he gave in Paris his first concert of original chamber-music works, which impressed Colonne so much that in the following year, he produced the youthful composer's first orchestral work, *Poème Roumain*. After his return from his first tour, Enesco settled permanently in Paris. In 1923 he won emphatic success in the United States as violinist and conductor. In 1912 he was made chevalier, and in 1924, officer of the Legion of Honor. His works comprise three symphonies (E♭, A, and C); two *Rumanian Rhapsodies* for orchestra (A and D); two orchestral suites; *Symphonie concertante* for 'cello and orchestra; a quartet and an octet for strings; three violin sonatas; works in larger forms for one and two pianos. An opera, *Edipus*, has not yet been produced.

**ENGEL, ENG'EL, CARL** (1883— ). An American musicologist and composer, born in Paris. While studying philosophy and literature at the University of Strasbourg, he also pursued the course in music with Professor Jacobsthal. In Munich, he studied composition with L. Thuille and musicology with Professor Sandberger. He came to the United States in 1905, where he soon became known as an ardent advocate, and exponent of futurism, contributing to American and English periodicals. From 1909 to 1922, he was editor and musical adviser for the Bos-

ton Music Company. In 1922 he succeeded O. G. Sonneck as chief of the Music Division of the Library of Congress. His compositions, all ultra-modern, consist of smaller pieces for piano, piano and violin, and songs. He is the author of *Alla Breve: From Bach to Debussy* (1921).

**ENGEL, EDUARD** (1851- ). A German writer and student born at Stolp in Pomerania. He studied Sanskrit and mediæval languages at the University of Berlin, but later devoted himself to modern literature, especially German. He edited a selection of *Byrons Tagebücher* (1904), and wrote on the Shakespeare-Bacon problem, *Shakespeare-Rätsel* (1904). His later works are *Geschichte der deutschen Literatur* (1906); *Geschichte der deutschen Literatur des 19 Jahrhunderts und der Gegenwart* (1908); *Goethe, der Mensch und das Werk* (1911); *Deutsche Stilkunst* (1911); *Deutsche Meisterprosa* (1912); *Ein Tagebuch: 1914-19* (1920); *Die Weisheit Goethes* (1920); and *Sprich Deutsch!* (1923). He edited a popular history of German literature and a popular edition of Goethe's works.

**ENGELHARDT, ENGELHART, EMIL A.** (1887- ). A German clergyman and writer who was born in Nundorf. Most of his works are concerned with the cultural position and future of Germany, among them being *Die Zukunft des Auslandsdeutschtums* (1916); *Auf deutschen Vorposten* (1916); *Fichtes Erziehungsgedanken und die deutsche Volkshochschule* (1918); *Tat und Freiheit, ein Fichtebuch* (1918); *J. G. Fichte, ein deutscher Mensch und Denker* (1919); *Fichtes Briefe an Braut und Gattin* (1920); *Erlöser Liebe* (1920); *Minne und Liebe* (1920); *Rabindranath Tagore* (1921); *Geist der Freiheit* (1922); *Die ewige Frau* (1923), and *Fichte-nationale Besinnung* (1925).

**ENGERT, ENG'ERT, T. JOSEPH** (1882- ). A German professor of philosophy and pedagogy. Since his début with *Der naturalistische Monismus Haeckels* (1907), he has written a number of works dealing with religious problems and with the World War, among them, *Vom Sinn des deutschen Krieges* (1916); *Zur Psychologie und Pädagogik der religiösen Begriffe* (1924); *Studien zur theologischen Erkenntnislehre* (1926), and *Das neue Leben* (1927).

**ENGLAND, CHURCH OF.** This denomination is represented in the United States by the Protestant Episcopal Church. It is the established Church of England, and the King of England is the supreme governor, with the right to fill vacant archbishoprics and bishoprics. For administrative purposes, the country is divided into two provinces, the Convocation of York and the Convocation of Canterbury, each under the control of an archbishop. In 1914 Parliament provided for the disestablishment of the Church in Wales, which was delayed on account of the War until Mar. 31, 1920. The National Assembly, established in 1919, is composed of three houses, of bishops, clergy, and laity, and is privileged to deliberate on all church matters except its doctrines and the

duties of the ministry. An act ratified by the Assembly is presented first to the House of Lords, and second to the House of Commons by their ecclesiastical committees, and when passed by Parliament, receives royal assent, and becomes a State law.

In 1927 the Revised Prayer Book Measure, on which many of the clergy, particularly the Archbishop of Canterbury, had worked for 20 years, passed the Assembly, was subsequently approved in the House of Lords, and on December 15, was rejected by the House of Commons by a vote of 238 to 205. The following month, the House of Bishops commenced rewriting the controversial points of the book, and on Apr. 27, 1928, the Assembly passed a new prayer-book measure. Amidst intense feeling, the House of Commons again rejected the book on June 14, by a vote of 266 to 220. The opponents of the new prayer book believed that it tended toward Catholicism, particularly in the article sanctioning reservation of the Sacrament, while the adherents believed that by defining the powers of the clergy the freedom of the laity would be increased. Many feared that the defeat of so important a measure would result in the disestablishment of the church, but the clergy maintained a conciliatory attitude. The Bishops, however, placed the book upon sale in 1928, with a prefatory note stating that it had not been authorized for use in the church.

Dr. Randall Thomas Davidson, Archbishop of Canterbury, resigned, and was succeeded by the Most Rev. Dr. Cosmo Gordon Lang, Archbishop of York, in December, 1928. The Rt. Rev. William Temple, Bishop of Manchester, then became Archbishop of York.

In addition to the controversy over the prayer book, several measures relating to the church were passed, tending to improve the financial condition of the clergy; and on Jan. 1, 1928, an act went into effect making the Church of England in India a voluntary organization.

There were 2,359,590 members of the denomination in 1915, and in 1927 2,528,303 received Easter communion; in 1915 the Sunday school pupils numbered 2,541,000, and in year 1927, 1,841,350. In 1927 there were 12,890 incumbents, receiving a total net income of £5,779,826; there were from 16,000 to 17,000 clergymen, and the stipends of the assistant clergy amounted to £1,021,315. In the 43 dioceses, £7,113,844 was voluntarily contributed during the year, and a total of £9,910,683 was received from all sources. The Church Assembly budget for 1929 amounted to £146,271, including £32,700 for religious education, £50,000 for a clergy pension scheme, and £20,000 for training new candidates for the ministry; the greater part of the sum was apportioned to the diocese.

**ENGLAND, GEORGE ALLAN** (1877- ). An American author born at Fort McPherson, Nebr. He was graduated from Harvard in 1902, and a year later published *Underneath the Bough* (1903). Other works of his include: *The Story of the Appeal* (1914); *The Air Trust* (1915); *The Great Crime* (1917); *Their Son* (1919); *The Flying Legion* (1920); *The White Wilderness* (1922); *Dialect Dictionary of Newfoundland* (1923); *Vikings of the Ice* (1923); *Adventure Isle* (1925).

**ENGLISH HISTORY.** See **GREAT BRITAIN.**

**ENGLISH LITERATURE.** See **LITERATURE, ENGLISH AND AMERICAN.**

**ENNEKING, JOHN JOSEPH** (1840-1916). An American landscape painter. He was born in Munster, Ohio, and studied in Munich and chiefly with Bonnat and Daubigny in Paris. In 1876 he settled in Boston, where he was closely associated with George Fuller and George Inness. Especially after 1882 his art became increasingly subjective. He had a facility in catching and reproducing atmospheric conditions in his canvases. This facility is illustrated in his treatment of November twilights and forest scenes. Ralph Davol said of him, "Enneking was a modern romanticist combining qualities of the impressionist, luminist, and tonalist." He is represented in the Museums of Worcester and Boston and in many New England private collections.

**ENTOMOLOGY, ECONOMIC.** The losses caused annually by insect pests in the United States alone are estimated by entomological authorities to exceed the enormous sum of \$2,000,000,000. While many factors complicate the problem, it is the general conclusion that, in an average year with no unusual attack, the loss caused to crops is about one-tenth of the total production. The indirect losses caused by insect-borne diseases reach a large sum. The loss of productive labor in the United States through the sickness and death resulting from malaria is figured at \$100,000,000, or more, and from all insect-borne diseases at over \$350,000,000. With the introduction of new pests from abroad and with the rise and spread of other native insects, this loss may be expected to increase unless the status quo can be maintained through the application of preventive and control measures by the hand of man.

During recent years, new pests of vast economic importance have been unwittingly introduced into the United States from abroad and become established, including the pink bollworm, European corn borer, Japanese beetle, Oriental peach moth, pine-shoot moth, European earwig, European red mite, satin moth, Asiatic beetle, Japanese garden beetle, date scale, and others: A second class, consisting of earlier introduced pests which have continued to spread and increase in importance, includes the gipsy moth, brown-tail moth, sugar-cane moth borer, sweet-potato weevil, cotton-boll weevil, alfalfa-leaf weevil, Argentine ant, Mexican bean beetle, pear thrips, citrus whitefly, and citrus blackfly. Others, which may be referred to as a third class, have risen and assumed alarming prominence, such as the potato-leaf hopper, potato tuber worm, Arizona boll weevil, cotton hopper, pea moth, citrus aphid, pea aphid, apple red bugs, camphor thrips, and the fruit-tree-leaf roller. To a fourth class belong untold numbers of pests of no less importance that are threatening to enter our borders, including the Mediterranean fruit fly, Mexican fruit fly, and others.

Other pests, such as the codling moth, San José scale, Hessian fly, chinch bug, spring-grain aphid, corn rootworm, bollworm, cotton-leaf worm, army worm, the grasshopper, cabbage worm, Colorado potato beetle, grain weevil, and others continue their ravages and, though they may at times be checked by climatic conditions and natural enemies, necessitate eternal vigilance on the part of the American agriculturist. Still other insects have become of great importance as agents in the transmission of plant diseases, including the beet-leaf hopper associated with curly leaf of sugar beets, the spinach

aphid and potato-leaf hopper with potato-leaf roll and alfalfa and apple-leaf yellows, aphids with mosaic disease of plants, etc.

In combating these pests, the entomologists have adopted strategic means of every kind and the resulting advance in preventive and control measures has been epoch making. Resorting to legislative means, Congress enacted the Federal Plant Quarantine Act of Aug. 20, 1912, which immediately became effective as to certain quarantines, and up to July 1, 1923, was administered by the Federal Horticultural Board, consisting of five members appointed by the Secretary of Agriculture. At that time, the work was placed under the newly organized Plant Quarantine and Control Administration. A quarantine against insect pests and diseases of plants from abroad has been established and maintained, inspectors having been stationed at every port of entry by land and sea. It would not be surprising, with the opportunities afforded, if, in spite of this vigilance, now and then a foreign pest should make its entry undetected, for they are often exceedingly elusive in the method of their introduction. However, with the exception of the pink bollworm, which gained entrance from Mexico before its lodgment there was discovered, no important pest is known to have become established in the United States since the enforcement of the act.

Not the least important work of the Control Administration are the quarantines established and maintained within the United States against the spread of a number of our most important pests. The investigation work is carried on by the Federal Government through the Bureau of Entomology, which in 1924 had 83 field stations in 32 States and Territories and 3 foreign countries. In the States, the work is conducted by the experiment stations, State entomologists, and, in several instances, by crop pest commissions. The State experiment stations have conducted investigations on hundreds of projects and have maintained vigilance and afforded local aid in control. The interstate spread of pests has been prevented to a large extent through State regulations requiring that nursery stock be free from infestation, and these are enforced by rigid State inspection.

**Gipsy Moth.** The gipsy moth was introduced by accident from Europe into Massachusetts about 1861. Work against it has been carried on since the early nineties, at first by the State of Massachusetts alone and since 1901 by the Federal Government and the States, but it has continued its spread. Encouraging results, however, have been obtained in work with native and introduced parasites. Investigations have shown that the natural spread of this moth, the female of which is wingless, takes place in large part through young caterpillars' being carried by high winds. The pest in 1914 was entering the eastern border of New York State in the course of its spread, and a barrier zone was established some 25 miles wide extending from Long Island Sound northward and up the Hudson Valley to the Canadian border. More recent accidental introductions of the pest on nursery stock have been successfully eradicated, except that of 1910 in New Jersey, where work was under way in 1923, with every prospect of its early eradication in that State.

**Brown-tail Moth.** The brown-tail moth is another defoliating pest which was accidentally

introduced into the United States, near Boston, from Europe. Since its introduction, about 1892, it has spread as far north as Nova Scotia and covers practically all of New England. The moth takes its name from the tuft of golden brown hairs at the tip of the abdomen. In the early fall, the young caterpillars spin tents at the end of twigs, incorporating leaves, in which they spend the winter, these tents being very conspicuous after the leaves fall. In the spring, the caterpillars leave the tents and feed on the foliage until June, when their development is completed. In addition to its injury from defoliation, it is a source of great annoyance from the hairs of the caterpillar, which break off at molting time and, being carried through the air, produce a painful rash. Its control is aided by cutting off and removing the tents in winter, by the application of arsenate of lead, and by parasites, many of which also attack the gipsy moth.

**Pine-shoot Moth.** The destructive pine-shoot moth was found in 1914 to have been introduced from Europe and to have become established in 10 localities in three States from Massachusetts to Pennsylvania, and the following year it was recorded from 20 localities in nine States, and by 1928 had become quite abundant in some localities.

**Codling Moth.** Investigations of this insect, which is responsible for the greater part of our wormy apples and pears, and which also attacks the so-called English walnut, causing a loss estimated at \$20,000,000 annually, led to increased activity in the dissemination of information as to the proper dates to apply arsenicals.

**Oriental Peach Moth.** The Oriental peach moth, which attacks the terminal twigs of the peach, plum, and cherry, stunting their growth, and which also infests the fruit of the peach and quince and to a lesser extent the apple, was first discovered in the District of Columbia in 1916. By 1928 it had spread as far north as Connecticut and Rhode Island, south to Florida, and west to Arkansas and Missouri. It is supposed to have been introduced with flowering cherry trees from Japan.

**Peach Borer.** This destructive borer in the lower trunk of the peach tree was quite effectively controlled by the use of paradichlorobenzene placed about the trunk and kept covered with soil for several weeks. The gas escaping from the chemical enters their galleries in the tree and destroys the borers.

**Pear Thrips.** The pear thrips, which for many years has been the source of serious injury to deciduous fruits through attacking the blossom, particularly of pears, prunes, and cherries, in the Santa Clara Valley, Calif., and later appeared in British Columbia, was discovered in New York State in 1911 and has become of considerable importance in the Hudson River Valley fruit belt. In 1915 it appeared in Maryland and was a source of injury in the vicinity of Baltimore.

**Japanese Beetle.** The green beetle *Popillia japonica* was introduced from Japan with nursery stock and became established near Riverton, N. J., where it was discovered in the summer of 1916. The beetle attacks the foliage of many kinds of fruits, vegetables, and ornamental plants, and the larvæ feed on the roots of plants and on decaying vegetable matter. Investigations of its biology and control have been con-

ducted and a quarantine has been established to aid in preventing its dissemination. It continued to spread, however, and by 1928 it had appeared as far east as Massachusetts and Connecticut, south in the District of Columbia, and west at Sayre, Pa.

**Mexican Bean Beetle.** The bean beetle, which originated in Mexico but has occurred endemically in the southwestern United States for 75 years, appeared near Birmingham, Ala., in July, 1920, spread rapidly, and became of great economic importance as an enemy of beans of all kinds through its defoliation of the plants. By 1928 it had spread as far north as Michigan and New York and had reached the Atlantic seaboard in North Carolina, Virginia, and Maryland.

**European Corn Borer.** This widely distributed European and Asiatic pest was discovered in 1917 in eastern Massachusetts, where it probably had been introduced in shipments of broomcorn from Europe. It appeared later in the Hudson Valley in New York, in southern Ontario, western New York, and northeastern Pennsylvania, whence it spread westward into Ohio and Indiana and by 1927 threatened to invade the whole Corn Belt. This borer, the larva of a moth, attacks all of the corn plant above ground except the leaf blades, channeling out the pith of the stalks of field and sweet corn and through the ears and into the kernels. The tassels and upper part of the stalks are weakened and often break over. There are two generations in New England, but in New York and the more western infestations there is generally but one. The winter is passed as a nearly mature or full-grown larva in burrows in the stubble or stalks near the ground, cobs, and the stems of other food plants of which it has a large number.

Much was accomplished in preventing its spread through the quarantining of infested areas and restricting transportation without such areas of materials in which it might be carried. An extensive clean-up demonstration and campaign of education was conducted in 1927 under a 10-million-dollar appropriation by Congress. This effort led to the perfection of machinery for the cutting and shredding and the plowing under of the corn stalks which serve as effective means of combating the pest.

**Cotton-boll Weevil.** The boll weevil, which entered Texas in the vicinity of Brownsville about 1892, continued its spread and by 1924 had occupied practically all of the old cotton-growing area of the United States. Appropriations made by Congress for investigations and control work with it have amounted to more than \$1,500,000. As a result of the extensive investigations, a highly toxic, finely divided calcium arsenate has been prepared, which is applied in a dust with high-powered dusting machines constructed for the purpose. The use of the airplane was found economical in the dusting of large fields and by 1925 the arsenical treatment was applied in that way to some 150,000 acres.

**Thurberia or Arizona boll weevil.** In 1913 a variety of the boll weevil that is resistant to arid conditions was discovered in Arizona living on a wild cotton-like plant of the genus *Thurberia*. From this host plant growing in the canyons, it spread to the cultivated cotton now grown under irrigation and threatens to become as great a pest of such cotton as the

1. Mediterranean Fruit Fly Affecting Lemon. 2. Orange. 3. Lemon. 4. Mandarin. 5. Larvæ. 6. Japanese Beetle Feeding on Peach and Foliage. 7. Japanese Beetle Feeding on Apple. 8. Field of Sweet Corn Severely Infested by European Corn Borer.

common boll weevil is of cotton grown under the customary humid conditions.

**Pink Bollworm.** In November, 1916, the occurrence of the pink bollworm in the Laguna district of Coahuila, Mexico, within 200 miles of the Texas border, was discovered, and an embargo was placed upon the importation of Mexican cotton. It was found the following year that the larvæ had been introduced in carloads of cottonseed shipped from Mexico before the quarantine in November, 1916, infestations being found at points in several counties in Texas and Louisiana. The infested areas were at once quarantined and eradication work was pressed with vigor under appropriations by Congress, apparently with success. From the infestation in the Big Bend area of the Rio Grande, it has spread along the Rio Grande and Pecos valleys in western Texas and southern New Mexico and into southeastern Arizona. It appeared in the spring of 1928 in seven new counties in western Texas on the edge of the main Cotton Belt. In order to prevent its entrance, houses have been erected at ports of entry on the Mexican border for the fumigation of freight cars from Mexico where they may have served as carriers of cotton and cottonseed, and all cotton from abroad has been fumigated in large cylinders with hydrocyanic acid gas in vacuum in order to destroy any larvæ present.

The pest has been introduced into Brazil, as well as Mexico, with seed, it being estimated to have caused a loss of \$27,500,000 in Brazil in 1918. It was introduced into the Hawaiian Islands about 1908 and was discovered in Porto Rico in 1921, where it has spread throughout the island. This moth, which originated in India and is now a source of great loss in Egypt, whence it has spread to other cotton-producing countries, and which constitutes one of the greatest menaces that have ever come to the American cotton industry, had not previously been known to occur in America, although prevalent in practically all of the other cotton-producing regions of the world, in all of which it has caused widespread destruction.

**Alfalfa-leaf Weevil.** This European insect, accidentally introduced into the United States and first discovered in Utah in 1902, continued to spread and by 1929 had become the source of considerable injury in Colorado, Idaho, Nevada, and Wyoming, as well as in Utah, and was entering California, Oregon, and Nebraska. Appropriations by Congress led to control work, in which particular attention was given to the introduction of insect parasites, one of the 10 species introduced from Europe killing as high as 90 per cent of the weevil larvæ in many localities.

**Argentine Ant.** This enemy of field crops, fruits, stored products, household supplies, etc., which was first discovered in the United States at New Orleans in 1891, continued to spread, and colonies were known to be established as far distant as Georgia, Texas, and California.

**Mediterranean Fruit Fly.** This destructive enemy of no less than 80 different subtropical fruits and vegetables, especially citrus fruits and particularly the orange, was first discovered in Hawaii on the Island of Oahu in 1910. Since that time, it has increased rapidly and spread into other islands. Control work has led to the introduction of a number of parasites, several of which are responsible for a considerable re-

duction in its infestation. This fruit fly has been the most serious drawback to fruit growing in the countries where it is established, its introducing into Bermuda many years ago having resulted in the destruction of the fruit-growing industry of that island. In order to combat and aid in preventing its introduction into the United States on the mainland, several emergency appropriations have been made by Congress, and all means for prevention are being employed by the inspection service of the Federal Plant and Quarantine Administration, the Plant Quarantine Act having made it possible to establish and maintain a quarantine against it. The first invasion of Continental United States by this cosmopolitan enemy of fruits and vegetables was discovered in Florida on Apr. 6, 1929. Funds for use in combating the pest with a view to its eradication were at once made available by both State and Federal governments. The extent of the infested area in central Florida was quickly determined and placed under quarantine.

**Other Insects.** Among other insects which have been introduced or become of great economic importance are the European red mite, first discovered in Canada in 1915 and a source of injury through its attack upon the leaves of the apple, plum, etc., in the northeastern United States; the Mexican fruit fly, which appeared in Texas in 1927; the European earwig, which first appeared in Rhode Island in 1911 and in Washington State in 1915 and is a source of injury to garden plants and flowers; the poplar defoliating satin moth, from Europe, which was first discovered near Boston, Mass., in July, 1920, and in Washington State in 1922; the Australian tomato beetle, first observed in Mississippi in 1921 and in California in 1926; the camphor thrips, first discovered in Florida in 1912; the pea moth, which is increasing in importance in Wisconsin; the sweet-potato weevil, which was first discovered in this country in 1875 but which began to spread and increased in importance about 1920; the fruit-tree-leaf roller, which has increased in importance due to its resistance to insecticides; the potato-leaf hopper, which causes tipburn of the potato; the cotton flea hopper, an active insect which first appeared as a serious pest of cotton about 1920; and others.

**Control Measures.** A notable advance has taken place in the knowledge of biological, insecticidal, mechanical, and other means of insect control. Search has been made and parasites of a considerable number of pests have been discovered and introduced from foreign lands. New insecticides have been discovered, and others have been adapted for more efficient control. Notable among the new insecticides is paradichlorobenzene, which has been successfully used in the control of the peach-tree borer. The lubricating oils have been found to form emulsions that are highly effective against scale insects on citrus, the San José scale, etc. New forms of arsenicals have been perfected, notably calcium arsenate in dust form, as employed in combating the boll weevil, sodium fluosilicate which is more toxic for some insects than are the arsenicals, Bordeaux oil emulsion spray for citrus insects, etc. Nicotin applied in a dust form has proved very effective as a means of control of the walnut aphid and a large number of other pests. Borax has been found to be effective, economical, and practical in the de-

struction of fly larvae in horse manure, and hellebore is also effective for this purpose. Corrosive sublimate has been found to be highly effective against root maggots. New methods of preparation and application of cyanide gas for combating citrus pests have been developed. The commercial manufacture of cyanide dust has led to its extensive use as an insecticide. New mechanical developments include the use of the airplane in applying dusts for control of the boll weevil, gipsy moth, etc. New machines for the application of sprays and new hand and power dusters have been invented or improved, and numerous mechanical devices have been developed.

**Apiculture.** Investigations of bee diseases, the greatest handicap with which the beekeeper has had to deal, resulted in a number of discoveries of great importance. A disease of the brood which has often been mistaken for one of the foul broods and to which the name "sacbrood" is given has been found to be due to a filterable virus. The deadly Isle of Wight disease of the adult bee, occurring in Great Britain and on the Continent, was discovered to be caused by the mite *Acarapis woodi* in the tracheæ, and an embargo has been placed upon the importation of bees in order to prevent its introduction into the United States.

**ENVER PASHA** (1882-1922). A Turkish soldier born at Constantinople and one of the first leaders of the Young Turk movement. In 1908 he led the revolutionary movement which forced the Sultan to restore the Constitution of 1876. In the same year, he was appointed military attaché at Berlin. In 1909 he helped put down a counter revolution and to depose the Sultan. He served in the army during the Italo-Turkish War (1911). In 1913 although not in the Government, he was active in the *coup d'état* caused by the humiliating peace terms, and in the following year he became minister of war. He appointed himself chief of the general staff, and started a thorough reorganization of the army. His appointment of the German general, Liman von Sanders, as a Turkish commander nearly caused an international incident. Throughout the World War, he remained in control of the army and it was largely due to his influence that Turkey allied herself with Germany. At the close of the War, he was charged with profiteering, and fled to escape death by a Turkish court martial. He became active in Soviet Russia as a leader against the various "white" generals, but in 1922 the Bolsheviks announced that he had betrayed them. He immediately started an anti-Soviet movement in Bokhara and was killed there on August 4 in a battle with Soviet soldiers.

**EPILEPSY.** Experience with epilepsy in soldiers during the World War confirmed the belief that all manifestations which come under this head may have a common origin; yet it became increasingly difficult to distinguish between primary and secondary or symptomatic epilepsy. Cranial injuries were found able to give rise to any or all of the clinical expressions of the disease; in some cases, the malady does not appear until more than a year after the injury. Nor did it appear necessary for the sufferer to have a strong hereditary predisposition to the disease; as a matter of fact, the medical selection of troops automatically eliminated many degenerate individuals.

Attempts have been made to bring epilepsy within the domain of psychoanalysis on the ground that the disease had a subconscious mental factor. Dr. Pierce Clark of New York published many articles to show that these patients are sometimes improved by psychoanalysis. The most sensational advance in connection with epilepsy was the introduction of the synthetic drug, luminal, allied in composition with veronal. The public was cautioned not to expect too much from this innovation, but it seems certain that it could very largely replace bromides with none of the severe constitutional effects of the latter. The dose, which is small, need not be increased to hold its effect; indeed, it is too powerful to warrant any attempt to increase it. Since 1920 this drug has been tried out very thoroughly; most reports were distinctly favorable. It also may be used to spare bromides and thus diminish the likelihood of bromide intoxication.

Another outstanding advance in the subject of epilepsy during recent years is undoubtedly the beneficial effects of a special diet, known as the ketogenic, of high fat and low carbohydrate composition. This is based on the fact that the acidosis or ketosis which results from starvation has a distinctly beneficial action on the seizures. The ketosis may be produced by the diet in question without any necessity for fasting;

and while in theory ketosis is a pathological state, its ability to arrest the fits over long periods in some epileptics has been demonstrated. While in some cases there is improvement, a considerable number remain quite refractory, this indicating that epilepsy may be due to very different causal factors. The greatest improvement was seen in children, and for several years only child cases were reported; but quite recently it has been found to be of no little value in adults. It will of course remain to be seen whether there are late relapses in the arrested cases, whether the treatment can be carried out on a large scale and is free from ill consequences. It has been shown recently that a mineral acidosis produced by certain inorganic salts will also arrest seizures, although in time the body seems to adapt itself to the treatment and the fits reappear.

**EPINEPHRIN.** See ADRENALIN.

**EPSTEIN, JACOB** (1880- ). An English sculptor (see VOL. VIII). Of extraordinary technical resourcefulness, he follows the traditions of dramatic sculpture by working with ridges and bosses rather than by the architecture of his planes. He is peculiar in the vehement violation of actuality in the individual head. His later works include "Christ," a very radical conception which caused much controversy; "The Sun God"; a series of powerful portrait heads, including Admiral Lord Fisher (Imperial War Museum, London); the bronze "American Soldier," Metropolitan Museum, New York; several versions of Mrs. Epstein; the Duchess of Hamilton, and a number of others in the collection of John Quinn, New York; the memorial to W. H. Hudson in Hyde Park, London (1925); "Study for a Visitation" (1926), in the National Gallery, London; and "Night" and "Day" (1929), two figures carved on the face of the boundary wall of the new Underground offices over St. James's Park Station, London. Consult the monograph by B. Van Dieren (London, 1920).

**ERB, NEWMAN** (1850-1925). An American railway official, born in Breslau, Germany. In 1853 he moved with his parents to the United States. He was educated privately and in the public schools of St. Louis. From 1886 to 1898, he was president of the Western Telegraph Company. He was president and receiver of several important railroads in the West and South, constructed and was president of the St. Louis, Memphis & Southeastern Railroad and was president and director of the Wisconsin Central Railroad in 1908-09. He was president of the Minneapolis & St. Louis Railroad and the Iowa Central Railroad for several years and was a director and official in many important corporations, chiefly connected with railways.

**ERDMANN, ERDMÄN, CHARLES ROSENBURY** (1866- ). An American theologian born at Fayetteville, N. Y., and educated at Princeton University, and the Princeton Theological Seminary. He was ordained in the Presbyterian ministry in 1891 and, after serving various pastorates, returned to the seminary at Princeton as professor of practical theology in 1906. He has been a delegate to Presbyterian conventions and world assemblies, was Moderator of the General Assembly of the Presbyterian Church, U. S. A., in 1925, and in 1926 was elected president of the Presbyterian Board of Foreign Missions. He is the author of *The Railway Rider* (1904); *Sunday Afternoons with Railroad Men* (1907);

*Coming to the Communion* (1912); *Gospel of John, an Exposition* (1916); *The Gospel of Mark, an Exposition* (1917); *The General Epistles* (1918); *The Acts* (1919); *Matthew* (1920); *Luke* (1921); *Within the Gateways of the Far East* (1922); *Return of Christ* (1922); *Pastoral Epistles* (1923); *The Lord We Love* (1924); *The Spirit of Christ* (1926).

**ERDMANN, BENNO** (1851-1921). A German philosopher (see VOL. VIII). His last work, *Grundzüge der Reproduktionspsychologie* (1920), concerned itself with the movement of thought and imagination.

**ERGOSTEROL.** See FOOD AND NUTRITION.

**ERIE.** A manufacturing and summer-resort city of Pennsylvania. The population rose from 66,525 in 1910 to 102,093 in 1920 and, according to local estimate, to 135,000 in 1928. City planning and zoning are highly developed, with a commission actively engaged in approving plans for future developments. A union passenger station, costing more than \$2,500,000, was completed in 1928, and is the first step in the development of the Civic Centre, consisting of the station, the proposed station plaza park, Griswold Boulevard, and the proposed Government post office, for which appropriation has been made by Congress. The public stadium, which has a seating capacity of 25,000, was erected in 1924 by popular subscription. A sewage-disposal plant, costing more than \$1,000,000, a garbage- and refuse-disposal system, and a storm-water sewer system are under construction. Presque Isle Peninsula, including about 3200 acres which form a protecting arm before the harbor, has been set aside as a State park and is being rapidly developed into one of the finest National parks in the East. Erie is one of the most active ports on the Great Lakes in the handling of grain and other freight. A passenger line connects it with Port Dover, Ontario. The assessed valuation of property in Erie in 1928 was \$142,674,027; the net indebtedness was \$8,084,507.

**ERITREA.** An Italian colonial possession in Africa on the west coast of the Red Sea. Area, 45,754 square miles; native population by census of 1921, 402,793. Europeans numbered 4251; of these, 3901 were Italian. Asmara, the seat of government, had 14,711 inhabitants, including 2500 Europeans; Massawa, the leading port, 12,275, with 137 Europeans. The export trade by sea comprises dried hides, palm-nut seeds, tinned meats, salt, mother-of-pearl, conch shells, flaxseed, rubber, and tanning materials; the sea-borne import trade, wines, cotton and cotton goods, mineral oils, cement, sugar, coffee, fats, and soap. Imports in 1927 were valued at 201,360,446 lire; exports, at 80,196,371 lire. The land transit trade in 1927, principally with Abyssinia, was valued at 58,413,398 lire in imports and 36,635,287 lire in exports. At Massawa, 628,104 tons of shipping entered in 1927. After 1912, 65 miles of railway were completed from Asmara to Cheren; by the end of 1928, the line from Cheren had reached Agordat (54 miles). At Massawa Asseb, and Asmara, wireless stations have been established to keep the colony in constant communication with Italian Somaliland and Italy. For the financial year 1928-29, the revenue and expenditure of the colony were estimated at: Colonial revenue, 42,482,300 lire; expenditure, civil administration, 25,497,050 lire; military, 16,985,250 lire. Efforts to attract Italian set-

tlers proved unsuccessful, because the highlands, the only areas suitable for European colonization, were already well filled by Abyssinians. The colony is not yet self-supporting.

**ERIVAN, ARMENIAN REPUBLIC OF.** See ARMENIA.

**ERMAN, ér'män, HEINRICH** (1857- ). A German jurist, born in Berlin and educated at the universities of Leipzig and Berlin. In 1883 he was appointed professor at Lausanne, and was subsequently professor of Roman law in Geneva. He was made honorary professor at Lausanne in 1902, and later at Münster-in-Westfalen. His works include: *Zur Geschichte der römischen Quittungen und Solutionsakte* (1883); *La Restitution des frais de procès en droit romain* (1892); *Servus vicarius, l'esclave de l'esclave romain* (1896); *Recht und Prätor* (1903); *Bedeutung der Bodenreform für eine aufstrebende Stadt* (1907); *Behandlung der Aktionen in den nachklassischen Rechtsbüchern* (1908); *Grundzüge für ein Kriegerheimstätten-Gesetz* (1916); and *Völkssiedlungen* (1925).

**ERMATINGER, ér-mät'ing-ér, EMIL** (1873- ). A Swiss author and professor at the University and Technical High School of Zurich, born at Schaffhausen. He studied law and philosophy at Swiss universities, but later devoted himself to teaching and writing. He wrote *Jenseits des Tages*, verse (1900), and several novels, among them *Weggeführten* (1902) and *Der Weg ins Leben* (1909), but was best known for his critical, biographical, and historical works, which were: *Antike Lyrik in modernem Gewande*, with R. Hunziker (1898); *Die Weltanschauung des jungen Wieland* (1907); *Gottfried Kellers Leben, Briefe und Tagebücher* (3 vols., 1915); *Die deutsche Lyrik in ihrer geschichtlichen Entwicklung* (1921); *Das dichterische Kunstwerk* (1921); *Wieland und die Schweiz* (1924); *Weltdeutung in Grimmelshausens Simplicissimus* (1925); *Barock und Roko in der Deutschen Dichtung* (1926), and *Krisen und Probleme in neueren deutschen Literatur* (1927).

**ERNLE, ROWLAND EDMUND PROTHERO, FIRST BARON** (1852- ). An English economist, born at Clifton-on-Teme. He was graduated from Balliol College, Oxford, in 1873, and was connected with that university as fellow and proctor until 1891. From 1894 to 1899, he edited the *Quarterly Review*. In 1913 he was a member of the Royal Commission on Railways. He represented the University of Oxford in Parliament (1914-19), in 1915-16 was a member of important committees on the production of food, and from 1916 to 1919 was president of the Board of Agriculture. He was president of the English Association (1921-22), and became an honorary fellow of Balliol College in 1922. He was made a baronet in 1919 and received honorary degrees from Oxford, Athens, and Wales. His writings include: *Pioneers and Progress of English Farming* (1887); *Life and Correspondence of Dean Stanley* (1893); *Letters of Edward Gibbon* (1896); *Letters and Journals of Lord Byron* (1898-1901); *The Psalms in Human Life* (1903); *The Pleasant Land of France* (1908); *English Farming, Past and Present* (1912); *The Land and its People* (1925); *The Light Reading of our Ancestors* (1927).

**ERNST, OTTO.** See SCHMIDT, OTTO ERNST.

**ERNST, PAUL** (1866- ). A German writer of essays, dramas, and fiction, born at Elbingen. He studied at the universities of Göttin-

gen, Tübingen, Berne, and Berlin. In his first efforts, the one-act plays *Lumpenbagasch* and *Im chambre séparée* (1898), he was influenced by the naturalism of Arno Holz, but later found himself in the volume of poems *Polymeter*, the two one-act tragedies *Wenn die Blätter fallen* and *Der Tod* (1899), and the volume of fiction, *Sechs Geschichten* (1900). After a sojourn in Italy, he published some translations, *Altitalienische Novellen* (1902), selections from *Des Knaben Wunderhorn* and a special edition of Arnim's *Isabella von Ägypten* (1903). He wrote a number of novels—*Die Prinzessin des Ostens*; *Der schmale Weg zum Glück* (1903); *Der Tod des Cosimo* (1912); *Die Hochzeit* (1913); *Saat auf Hoffnung* (1915); *Die Taufe* (1916); *Der Nobelpreis* (1917)—a volume of short stories, *Komödiantengeschichten* (1920); and a drama, *Preussengeist* (1915). His books of essays, *Der Weg zur Form* (1906) and *Der Zusammenbruch des Idealismus* (1919), attracted much attention. His later works include a volume of imaginary conversations *Erdichtete Gespräche* (1920); some occult stories, *Okkultistische Novellen* (1921); *Zusammenbruch und Glaube* (1922); *Das Kaiserbuch* (1923); *Geschichten aus dem Süden* (1925); and *Der Schatz im Morgenbrotstal* (1926).

**ERSKINE, JOHN** (1879- ). An American university professor of English (see VOL. VIII). He published: *The Moral Obligation of the Intelligent*, and *Other Poems* (1915); *The Shadowed Hour* (1917); *Democracy and Ideals* (1920); *The Kinds of Poetry* (1920); *Collected Poems* (1922); *The Literary Disciple* (1923); *Sonata, and Other Poems* (1925); *Private Life of Helen of Troy* (1927); *Prohibition and Christianity* (1927); *Penelope's Man* (1928); *The Delight of Great Books* (1928). He has edited various works and was educational director of the American Expeditionary Forces during the World War, and received the Distinguished Service Medal. In 1927 he became president of the Juilliard School of Music in New York.

**ERVINE, úr'vin, ST. JOHN GREER** (1883- ). An Irish dramatist and novelist, born at Belfast. His first play, *The Magnanimous Lover* (1907), possessing a distinctly moral flavor, was produced at the Abbey Theatre, Dublin, in 1913. Two years later he was manager of the same theatre. He is the writer said by Arnold Bennett to be "probably unequaled by any other playwright" in England, who had in his work "combined great skill, fine ideas, and perfect sincerity with immense popular success." In 1928-29 he was dramatic critic of *The World* (New York). He wrote the following plays: *Mixed Marriage* (1910); *Jane Clegg* (1911); *Four Irish Plays* (1914); *John Ferguson* (1914); *The Wonderful Visit*, with H. G. Wells (1921); *The Ship* (1922); *Mary, Mary, Quite Contrary* (1923); *The Lady of Belmont* (1924); *Anthony and Anna* (1925), and *Four One-Act Plays* (1928). His other publications include the novels *Mrs. Martin's Man* (1915), *Alice and Family* (1915), *Changing Winds* (1918), *The Foolish Lovers* (1920), *The Wayward Man*, and *The Mountain* (1928); the tales *Eight o'Clock and Other Studies* (1913), and *In Inland Seas* (1928); the political studies *Sir Edward Carson and the Ulster Movement* (1915), and *Parnell* (1925); and *The Organised Theatre; a Plea in Obitis* (1924); and *How to write a Play* (1928).

**ERYSIPELAS.** This affection although not deadly save in certain types of case is of com-

mon occurrence and causes much disability and hospitalization. A specific treatment should not only save some life but should also cut short the usual period of disability and internment. Quite recently Dr. Birkhaug of Rochester, N. Y., perfected an antitoxin which at first appeared to give superior results although later experience seems to have thrown some doubt on its value. However, in Bellevue Hospital, New York, which is believed to have the greatest erysipelas contingent in the world, the results have been more than satisfactory. Dr. Symmers, who reports his experience in the *Journal of the American Medical Association* for Aug. 25, 1928, has tested the serum in hundreds of cases, is most enthusiastic over its efficacy and pronounces it a great advance. The only drawback, if such it can be termed, is the absence of any immunizing factor; for apparently the discharged patients can readily contract the disease anew. The total number of cases thus far treated in Symmers's Bellevue service is over 700 and the mortality was 5 per cent for facial and only 8.4 per cent for corporeal erysipelas (which may reach 40 per cent at times); the average duration of hospital sojourn was much reduced.

**ERZBERGER**, ər'z'bər-gēr, MATTHIAS (1875-1921). A German politician, born at Butthausen (Württemberg). He began his career as a school-teacher, then was a journalist, becoming a member of the staff of the *Deutsches Volksblatt* (Stuttgart) in 1896. His political career began in 1903, when he was elected to the Reichstag as representative of the Catholic Centre Party. During the World War, he at first made extravagant efforts to increase German annexations, but later became just as active in furthering peace negotiations. It was he who instigated the "Peace Resolutions" drawn up by the Reichstag in 1917; and when, in 1918, he succeeded Bethmann-Hollweg as Secretary of State, he conducted the Armistice negotiations and signed the agreement on November 11. Becoming Finance Minister of the Reich in 1919, he was forced to resign on account of a legal controversy with Dr. Helfferich, the Nationalist leader. The Conservatives and National Liberals criticized him not so much for his peace negotiations as for his financial policy, which hit capital and landed interests. His supporters were the Catholic working classes. The culmination of the attacks upon him was his assassination on Aug. 26, 1921.

**ESENWEIN**, JOSEPH BERG (1867- ). An American editor, born in Philadelphia, and educated at Albright College, Millersville Normal School, Lafayette College, Richmond College, and the University of Omaha. He was president of Albright Collegiate Institute in 1895-96 and later became professor of English in the Pennsylvania Military College at Chester, subsequently giving up teaching (1903) to become manager of the *Booklovers' Magazine*. Two years later, he was made editor and manager of *Lippincott's Magazine*, a position which he held until 1914. In 1915 he became editor of *The Writer's Monthly*, Springfield, Mass. He is known both as a lecturer and writer. His published works, besides articles contributed to Charles Dudley Warner's *Library of the World's Best Literature*, include: *Songs for Reapers* (1895); *Modern Agnosticism* (1896); *Feathers for Shafts* (1897); *Short Story Masterpieces* (1912); *Children's Stories and How to*

*Tell Them* (1917); *Russian Short Story Masterpieces* (2 vols., 1919); *Writing Good English* (1925).

**ESHER**, REGINALD BALIOL BRETT, SECOND VISCOUNT (1852- ). An English politician and author, born in London and educated at Eton and Trinity College, Cambridge. He was a member of Parliament from Penryn and Falmouth (1880-85), secretary to the Office of Works (1895-1902), chairman of the War Office Reconstitution Committee (1904), and a permanent member of the Committee of Imperial Defense. He was deputy governor of Windsor Castle from 1901 to 1928, when he became governor. King Edward VII appointed him one of the editors of *The Correspondence of Queen Victoria* (1907). Among his publications are *Footprints of Statesmen* (1892); *To-day and To-morrow* (1910); *Influence of King Edward*, Essays (1914); *After the War* (1918); *The Tragedy of Lord Kitchener* (1921); *Ionious* (1923); and his reminiscences, *Cloud Cap't Towers* (1927).

**ESKIMOS**. See ALASKA, under *Natives*; **ETHNOGRAPHY**, under *North America*.

**ESPERANTIDO**. See INTERNATIONAL LANGUAGE.

**ESPERANTO**. See INTERNATIONAL LANGUAGE.

**ESPINA**, CONCHA (1879- ). A notable Spanish woman novelist. Born in Santander, where she published verses in the daily *El Atlántico* while still a girl, she went in early youth to Chile. On her return to Spain, she continued to write for Spanish-American papers, but she had long since turned to prose as her usual medium of expression, and she has developed therein a limpid, flexible, vibrant style with which she seems to be able to do everything she will. Her works have brought her prize after prize, the Royal Spanish Academy alone having awarded her the prizes known as Fastenrath, Espinosa Cortina, and Castillo de Chirel. In 1929 she was visiting professor at the Middlebury, Vt., Spanish School. The Hispanic Society of America (of which she is a corresponding member) has awarded her its medal for Arts and Letters. Among her best works (many of which have been translated into several languages) are *Mis flores* (poems, 1904); *Trozos de vida* (articles and stories, 1907); *La niña Luzmela* (1909); *Despertar para morir* (1910); *Agua de nieve* (1911); *La espinja maragata* (1914); *La rosa de los vientos* (1916); *Ruecas de marfil* (1917); *El jayón* (drama, 1918); *Pastorelas* (1919); *El metal de los muertos* (1920); *Dulce nombre* (1921); *Ouentos* (1922); *Simientes* (1923); *El odio rojo* (1924); *Tierras del Aquilón* (1926); *Las niñas desaparecidas* (1927); and *La virgen prudente* (1929).

**ESTAUNÉ**, ɛs'ton'ɛ', EDUARD (1862- ). A French author and engineer who was born in Dijon and educated at the Jesuit school there, the Lycée Saint-Louis, and the École Polytechnique. He was director of the École Supérieure de Télégraphie, and of material and construction at the ministry of posts and telegraphs. In 1923 he was elected to the French Academy. His novels showed keen psychological insight and were usually deeply thoughtful. They include *Un Simple* (1890); *L'Empreinte*, crowned by the Academy (1896); *L'Épave* (1902); *La vie secrète*, Prix de la Vie Heureuse (1908); *Les Choses violent* (1913); *L'Ascension de M. Baslèvre* (1918); *L'Appel de la route* (1921);

*Le Labyrinthe* (1923); *Le Silence dans la campagne*, short stories (1926), and *Tels qu'ils furent* (1927). He also wrote *Petits-Maitres*, art criticism (1893); *Les Sources d'énergie électrique* (1895), and *Traité pratique de télécommunication* (1904).

**ESTELLA**, MARQUÉS DE. See RIVERA Y OBANEDA, PRIMO DE.

**ESTONIA.** A republic on the Baltic Sea, made up of the former Russian government of Estland, the northern part of Livland, the islands Saaremaa, Hiiumaa, and Muhumaa, and parts of the Petseri district of the Pskov government and the Gdowski district of the Petrograd government. Estonia became a republic on Feb. 24, 1918, after the Bolshevik *coup d'état*. By Treaty of Tartu with Russia on Feb. 2, 1920, and by an agreement with Latvia, her sister republic to the south (Nov. 1, 1923), Estonia's political borders were extended to coincide with her ethnographic limits. The area is put at 18,354 square miles, and the population, Jan. 1, 1926, 1,117,270; estimated, 1928, 1,115,094. Of these, 87.7 per cent were Estonians and the rest Germans, Russians, Jews, Finns, Swedes, and Letts. The capital, Reval, had 160,000 in 1917 and in 1926, 127,000 inhabitants. Narva, the chief manufacturing centre, was credited with a population of 27,975. Five-sixths of the population were Lutherans, and the rest were Greek Orthodox and Roman Catholics.

**Industry.** The great portion of the population works on the land. Up to the passage of the land reform bills of 1919, property was concentrated mostly in the hands of the Baltic barons and the clergy, of German descent; native Estonians were merely farm hands or small peasant proprietors. By the Bill of Oct. 10, 1919, an ambitious programme was projected for the almost complete confiscation of these large estates and their allotment among the peasants and soldiers. Some indemnity was provided for, but the basis was not to be the real value but the size of the land tax. Lack of capital for buildings and deterioration of farm stocks imposed almost insuperable difficulties on the realization of the programme. Of the total area of 10,851,500 acres, forest land, owned by the state, comprised 20.1 per cent; fields, 22.9; meadows, 24.; pastures, 17.5; untillable land, 15. The acreage under various crops and the harvests of 1922 and 1927, compared with the average for five pre-war years, 1910-14, are given as follows:

#### PRINCIPAL CROPS

Crop	Area in acres		Production in thousands of bushels		
	1922	1927	1910-14 (average)	1922	1927
Rye	392,000	367,000	6,702	5,079	6,735
Oats	395,700	360,000	7,531	9,901	6,727
Barley	331,100	295,000	5,269	6,564	4,335
Wheat	52,200	67,000	257	748	878
Potatoes	186,600	176,000	27,701	25,932	27,253
Flax and flaxseed	59,200	88,000	25,400	17,400	10,634

\* Metric tons.

Live stock in the country in 1927 numbered 224,820 horses, 628,880 head of cattle, 354,000 swine, and 665,510 sheep. There are textile, hemp and rope, paper, metal, and shipbuilding works, but up to 1929 these were languishing because of deterioration and lack of capital.

**Trade.** In 1920 exports were valued at \$17,544,278 and imports at \$19,931,218, similar

figures for 1927 were \$28,207,000 and \$25,713,000. The chief exports in 1927 were: Butter (\$7,377,000); boards and planks (\$2,941,000); raw flax (\$2,760,000); and cotton fabrics (\$2,325,000). The principal imports: Cotton (\$2,406,000); sugar (\$1,894,000); rye (\$1,333,000); and wheat (\$1,093,000). Germany supplied 26.4 per cent of the imports and purchased 29.8 per cent of the exports; the United Kingdom, 12.1 and 31.4; Russia, 7.5 and 6.3; and the United States, 12.0 and 1.2. Commerce for 1928 expressed in kronas (1 kron = \$0.268); imports 1,131,373,000 kronas; exports, 127,109,000 kronas. During 1927, 2672 vessels of 849,996 tons entered the Estonian ports of Reval, Narva, Pernau, Port Baltic, Hapsal, Kunda, Arensburg, Loksas, and Rohukala. The total length of railways in 1926 was 1130 miles, all owned and operated by the states.

**Education.** Elementary education is free and compulsory. In 1926 there were 1356 elementary schools, 231 higher schools, 81 gymnasias, several normal schools, a technical school at Reval, and a state university at Dorpat. The last, reopened in 1919, had, in 1926, 4651 students. The minority nationals, Germans, Russians, Swedes, and Letts, are guaranteed instruction in their mother tongues.

**Finance.** In 1922 expenditures were 5,510,300,000 Estonian marks and the revenues, 5,065,300,000 Estonian marks. In 1923 the budget deficit was estimated at 700,000,000 Estonian marks or about 10 per cent of the total expenditures of 6,775,000,000 marks; for 1928-29 the budget balanced at 8,026,661,000, but a surplus was confidently expected. Estonia's national debt, all of which is funded, totaled 11,069,600,000 marks (\$29,667,000) on Jan. 1, 1928; the internal debt was only 64,700,000 marks. The total amount owed to the United States was \$19,717,000.

**History.** The Russian Revolution brought with it a state of uncertainty in Estonia which was not dispelled until late in 1920. Some sentiment inclined toward the Allies; the Baltic lords were openly friendly to Germany. A republican government, proclaimed on Feb. 24, 1918, had but a brief career before it was put to flight by the German troops who entered the country as a result of the Brest-Litovsk Peace Treaty, captured Reval from the Bolsheviks, and restored the Baltic land barons under German protection. A provisional government, set up by the native moderate elements, was disregarded, and German occupation continued until the end of the year. During May, 1918, the Estonian National Council was accorded provisional *de facto* recognition by Great Britain, France, and Italy. By the Russo-German Treaty of August, 1918, Estonia's independence was recognized, but when the Germans withdrew their troops after the Armistice of November, 1918, Soviet forces once more poured in, to be driven out by local troops with Finnish and British aid. The exiled Estonian leaders returned to their war-ridden country, and on May 19, 1919, the National Assembly declared Estonia a sovereign and independent nation. Hostilities with Russia continued until Dec. 31, 1919. Affairs were complicated by the threat of a German movement on the Baltic states and by the intervention of Allied armies on the northwest coast of Russia in the autumn of 1919. The United States, in an endeavor to gain Estonia's support against the Bolsheviks,

offered the country a loan of \$50,000,000, a considerable portion of which was taken. The Russian succession states, Finland, Lithuania, Latvia, and Estonia, wearied of the conflict, and an armistice was signed at Dorpat on Dec. 31, 1919. The Russo-Estonian Treaty of Feb. 2, 1920, put an end to hostilities. The terms were remarkably favorable to Estonia. The country's independence was unreservedly recognized and guaranteed by Russia; Estonia received 15,000,000 gold rubles, all Russian public property in Estonia, and exemption from any share in Russian debts. The Constituent Assembly on June 15, 1920, prepared the country's new constitution. A single house, popularly elected on the basis of proportional representation and controlled by the initiative and referendum, was set up. The cabinet, whose premier was designated the State Head, was to be elected by and responsible to the Assembly. The State Court of Justice was to be elected by the Assembly too. The Assembly, in 1921, had 22 representatives of the Labor Party, 29 of Socialist parties, and 5 Communists, together constituting the majority bloc; 21 Agrarians, and the rest Populists, Christians, Balts, and Russians. By the Land Act, the church was separated from the state and its extensive holdings confiscated.

On June 26, 1921, the Supreme Council of the League of Nations accorded the country *de jure* recognition. Shortly afterward, on September 22, it was admitted to the League. Recognition by the United States was delayed until July 27, 1922. In May, 1923, the election of the second Parliament returned a majority bloc of the bourgeois and peasant parties with the result that M. Paetz, leader of the Peasants' League, was entrusted with the formation of a government.

Russia's consistently friendly policy toward her succession states was further evinced by the series of discussions among the Baltic states, including Estonia, in October and November, 1921, and March and December, 1922. These meetings agreed on arbitration of disputes, confirmation of existing frontiers, agreement on customs, consular, and economic matters; a common economic policy toward Russia, and radical disarmament plans involving the cutting of the Russian Red Army to 200,000. In 1923, it appeared for a time that Estonia was prepared to join with Finland and Poland in an alliance aimed at Russia, but peace was maintained, so that all energies, in 1923 and 1924, were devoted to the solution of domestic problems. Among these, currency stabilization was one of the most needed reforms. On June 20, 1924, a law was passed stabilizing the currency, at 100 Estonian marks to the Swedish gold krona, and providing for an issue on a gold-standard basis at a later time. Steady improvement in the country's finances was evidenced by the balancing of the 1926 budget. In 1925 the debt to the United States was funded, the total being placed at \$13,830,000, the bonds for which were to run over a period of 62 years. The debt to Great Britain also was consolidated. In 1926 the government, with the help of a loan from the League of Nations, planned a further monetary adjustment, and this was brought about in the following year. Beginning Jan. 1, 1928, the currency unit was made the gold kroon, with a content of 0.403226 grams of pure gold. This unit, corresponding to the Scandi-

navian crown, was divided into 100 sents, each sent having the value of a former Estonian mark.

In this period changes of ministry were almost an annual occurrence. In March, 1924, Premier Paetz resigned and was succeeded by Dr. F. Akel, Foreign Minister. Communist agitation marked the whole of the year 1924. In November, 149 Communists were brought to trial and most of them were convicted and sentenced to varying terms of prison. On December 1, following the conclusion of the trial, Communists, in an armed uprising, attempted to seize the Government. There was some fighting, resulting in the killing of the Minister of Ways and Communications, but the outbreak was soon suppressed. M. Akel's government, however, resigned and was succeeded by a coalition of all major parties with Jüri Jaakson as Premier.

In January, 1925, the foreign ministers of Estonia, Latvia, Finland, and Poland held a conference at Helsingfors at which, among other agreements, a treaty of obligatory arbitration was drawn up. A treaty of arbitration was also concluded between Estonia and Germany in 1925. In December, 1925, M. J. Teemant displaced M. Jaakson as head of the state. Among the measures passed by the Diet at this period were one separating church and state and another providing for payment of former landowners for land expropriated in 1919. In December, 1927, the cabinet of M. Teemant in turn gave way to one formed by J. Toennisson, under whom the country on Feb. 24, 1928, celebrated the tenth anniversary of its independence.

A year later, in November, 1928, Premier Toennisson, who was a member of the Right, resigned and was succeeded on December 5 by the Socialist A. Reij, who formed a coalition cabinet. On Feb. 9, 1929, Estonia, together with Poland, Rumania, Latvia, and Soviet Russia signed at Moscow the Kellogg Peace Treaty and, at the same time, signed the "Litvinoff protocol," agreeing to put the treaty into effect as soon as it was ratified by the various parliaments, without waiting for further ratifications by other nations. In April, 1929, an agreement by a mixed commission on a revision of tariff rates between Estonia and Latvia was announced.

**ETHICS.** Recent work in ethics divides itself neatly into two complementary parts, that which may be called scientific and deals with the ways and means of life, and that which is philosophical and deals with ends and values. It is only in the practical solution of the immediate problems of individuals or groups, or in very abstract metaphysical theory, that the two parts are combined.

The former part has followed the method and style of the empirical social sciences and has issued in a summary and organization of their conclusions. Contributing to it, there has been the study of human geography, an account of the effects of climate and other natural conditions on human temperaments and habits. The best-known leaders in such work are Brunhes in France and Huntington in America, both taking their cues from Ratzel in Germany. Following Durkheim in France and Sumner in America, the anthropologists have extended the theory of invention and diffusion of culture patterns. The methods employed in the study of gregarious insects and of investigating primitive human societies have established categories

for the analysis of more highly civilized forms of life, and as a result we have the anthropological survey of our own communities. Levy-Bruhl, Elliot-Smith, Malinowski, and Bas present variants on the main principle which orders social facts, habits, folkways, mores, in evolutionary series within which the laws of chance variation, rivalry, adaptation, and the survival of the fittest hold. Into this theory they have introduced the neo-Marxian hierarchy of tools and their operation, technologies, industries, cultures, and civilizations. The principles of Marxian economic history are thus added to the laws of Darwinian biological evolution, and it is only an extremely unusual social fact that cannot be measured and placed in such a conceptual network. Socialized ways of life, thus accounted for, constitute one class of fundamental gross data for scientific ethics.

The other important class of such data comes from psychology, the types of personality and character that fit into the social groups. Fundamental human uniformities have been found in man's common biological and physiological traits, and differentiations of types and individuals are explained by the conditioned reflexes of the behaviorist and the interplay of complexes of the psychoanalytic school. It has been seen that these two schools of psychology represent the laboratory and the clinic, respectively, and that their conclusions are compatible and complementary, in so far as they provide the atomic data for ethics.

There has been some speculation on the ability of biochemistry to make a further analysis of these units, but so far the results are only programmes of research for such projects as the Institute of Human Relations at Yale University.

So far it has been left to the moral philosopher to apply and evaluate the new theory of human nature. He has chosen the easiest course. It has been easy to subsume the facts under the traditional doctrines of self-realization ethics, provided by the neo-Hegelian idealists, Bradley, Green, Hobhouse, and Westermarck. These doctrines have come down from nineteenth-century philosophies of economics and political science that interpret the facts of human nature as intimations of his ideal destiny. Others have equally persuasively argued that the facts of human nature reveal its inevitable limitations; the mosaic of society is a machine in which individuals are minute parts pushed and pulled by far more inscrutable forces than any divinity ever controlled. This is a pseudo-metaphysics inherited from Spencerian sociology.

The pragmatic school in America sees the separate parts of the machine as instruments to be operated according to human choice for specific ends, and they go on to outline programmes for the social engineer. Dewey's *Experience and Nature* is the best statement of the American faith. In general, the Europeans follow Hegelian or Marxian theories of history and Americans attend to the engineering formulas.

The proponents of these theories have tried to restrict their conclusion, to descriptions of facts, and they disclaim any attempt to prescribe conduct or valuation. Actually, their statements of facts are general genetic laws of human behavior, and as such, they conform to Kant's hypothetical imperatives. Placed in the traditional contexts, they become the rules for an elaborate system of casuistry, the intermediate

proposition required in any application of criteria of value to cases of human conduct. They manifest the relativity which has always been the mark of subjective and highly specialized "philosophies of life."

The claim that empirical generalization is all there is in ethical science is continually made, and, as always, it has the effect of setting up pseudo-absolute standards. So when we turn to the second part of ethical studies in this period, we find one or another set of social facts preferred and vested with authority as a standard for measuring values. A folkway is said to "emerge" from its context and its natural origins, and offers to "natural piety" a "higher" authority. It may have emerged from a temperamental bias, an institutional success, a racial memory, a tragic experience, or as simply a "sport" in social evolution, but as emergent, it takes on the divine right to dictate a code of ethics and demand acceptance. The means become their own end and justify themselves. The natural process leading up to an event becomes a work of art and a ritual, a mystery not to be criticized. This is the dominant mode of thought in England and America where emergent evolution is reducing science to canonical doctrine. In the theory of value, its conclusions can be formulated in the old definition of the good: The good is that which is desired. This means that a thing is good because it is desired. It is an effective evasion of the formal problems in ethics.

The ethical theorists who follow the formal tradition in moral philosophy take the naturalistic and genetic descriptions for granted and attempt to discover the intrinsic character of value. The most important workers in this phase of ethics derive their methods from the Austrian school of economics. For them, the assumption is that the essence of value is an objective *worth*. Corresponding to our judgments of value, there is an objective of which a good thing is a realization. On analysis, this objective turns out to be a Platonic form capable of rigorous logical treatment. The theory of value turns out to be a restatement of scholastic ethical theory without the specialized theological or ecclesiastical bias. This theory originates with Brentano and Meinong in Austria, and is being developed by Rickert and Husserl and their followers in Germany. Its influence has been growing steadily and spreading to specialized fields of study. The Platonic tradition has always been strong in the philosophy of law. It is critical and formal in method and aims at clear definitions and sharp distinctions which empirical social science generally lacks. It is therefore valuable for the regulation of applied science and for professional training.

The non-academic discussion of ethical problems has proceeded as usual with more heat than light. Governments and newspapers are turning more and more to the scientific survey and collection of facts. These surveys originate in practical problems or in moral indignation. They are delegated to experts who put them through the statistical process and they finally issue in some programme of reform, or educational propaganda. The ethical principles involved are gross popular conceptions based on widespread sentiments, and the terms of their expressions are "stereotypes." The subject matter ranges from sex and marriage to the abolition of war, and

the solutions from psychological prescriptions for self-improvement to world movements in education and social regeneration. The best analysis and discussion of this sort of ethics is to be found in the writings of Graham Wallas, Walter Lippman, and Everett Dean Martin.

The movements that have resulted from these programmes and propaganda dramatize and finally reformulate persistent ethical themes. Parents worry about the "younger generation" and eventually find consolation in the establishment and support of mystical religious societies. The younger generation organizes an international youth movement to work out an ethics of emancipation for the next generation. Gordieff, an Anglo-Russian, has founded an institution at Fontainebleau, France, with a programme for the full training of the individual in physical, emotional, and intellectual culture. This institute has wide influence through centres in New York, London, and other cosmopolitan cities. Charity organizations have concentrated their work on a programme for community mental hygiene. Schools have become experiment stations for colleges of pedagogy where psychology and psychiatry hold the centre of the curriculum. Community welfare work is now called adult education.

Out of the experience and discussion that these movements generate, there often come very important theoretical works. The best example in recent years is the writing of R. H. Tawney. His *Religion and the Rise of Capitalism* is written with scholarship, humor, and fine sensibility, and states the historical case for the British Labor Movement. It presents the general thesis which originated in Max Weber's famous essay, *Die Protestantische Ethik und der Geist des Kapitalismus*, that the shift in dominant ethical values from the Middle Ages to the eighteenth century was due to the rise of the mercantile and industrial class, and the reaction of the ecclesiastical aristocratic class to the economic and social problems that followed. The virtues of charity and poverty became vices, and prosperity and thrift became dominant virtues. Other moral values undergo a corresponding evaluation. This book does more adequate justice to both empirical and formal ethical doctrine than any other recent book. Together with its forerunner, *The Acquisitive Society*, it has laid the foundation for both theoretical and practical ethics for modern demands.

There has been growing a doubt whether ethics is a science at all. This is the most significant comment that can be made upon recent ethical theory. It seems that the best ethical discussions are to be found in the modern novel and the literary criticism that follows it. This may mean that the artist and the critic have taken over the functions which religious institutions have increasingly failed to fulfill. If this is true, we may expect very little from the professional student of ethics for a long time to come. Scientific ethics supplies only crude material and confusion, and the artist is never concerned with the morals of his stories.

Wheeler, *Social Life Among the Insects* (1923).

**ETHNOGRAPHY.** The literature descriptive of primitive cultures has attained enormous proportions. Although explorations and description were curtailed during the World War, the subsequent period has witnessed unparalleled activity. The present ranking of the primitive areas in the order of completeness of ethnographic surveying is roughly North America, Africa, southeastern Asia, Siberia, Polynesia, Melanesia, South America, Australia, and Micronesia. In recent years, work has gone forward in all these fields but was especially noteworthy in Polynesia and South America, both regions heretofore barely known. Only a single general summary has been published, Buschan's *Illustrierte Völkerkunde* (1922) in a new and augmented edition, although summaries for continental areas were also made available.

**North America.** C. Wissler's *The American Indian* (2d ed., 1922) furnished a comprehensive view of both Americas although it is far more adequate for the northern continent. Complementary to this, although less a survey than an analysis of problems, is *Anthropology in North America* (1915), by F. Boas and others. These inject some order into the maze of discrete data presented by the *Handbook of American Indians North of Mexico* (1907).

Of the nine areas of characterization (culture areas) north of Mexico, only the Arctic and the Northwest Coast were reasonably well-known in the first decade of the century. By 1915 the Plains could be added to this category, California and the Southwest have been added since, and work has progressed in every other quarter. The Great Basin and the interior of Canada and Alaska still remain largely *terra incognita*.

To the earlier work of Dorsey and Mooney in the Plains, the American Museum of Natural History added a notable series of systematic studies of material culture (Wissler), social organization (Lowie), and ceremonial (Lowie and Spier). Wissler's analysis of Plains costumes and riding gear (*Anthro. Papers, Amer.*

*Mus. Nat. Hist.*, 1915-16) demonstrates the development of specific forms of culture traits under known historic conditions. Lowie's *Plains Indian Age-Societies* (*idem*, 1916) is the most comprehensive analysis of a socio-ceremonial system anywhere in the primitive world. The widespread military societies of the Plains Indians are shown to have become integrated into a series of age grades among some of the centrally located tribes. Since the process is demonstrably due to specific historic circumstances, Lowie objects to Schurtz's and Webster's evolutionary theories of age grade formation. Similarly, the *Sun Dance of the Plains Indians* (*idem*, 1921) was shown by Spier to have grown by the accretion of widely diffused elements. Lowie's monographic study of the Crow Indians (Montana) must also be cited as one of the most complete on any primitive people (*idem*, 1912-24). Grinnell's *Cheyenne Indians* (1923) and Fletcher and La Flesche's studies of the Omaha and Osage tribes furnish new ethnographic accounts. Wilson's *Agriculture of the Hidatsa Indians* (1917) is one of the most detailed economic studies of a primitive people. The southern Plains tribes still remain relatively unknown.

A series of similar descriptive works cover the Indians of the Great Lakes: Radin's *Winnebago Tribe* (1923), Skinner's study of the Menomini, Potawatomi, Iowa, and Sauk (*Bull. Public Mus. Milwaukee*, 1926), and Michelson's "Fox" (*Bur. Amer. Ethnol.*, 1926-28). Radin's *Autobiography of a Winnebago Indian* (1920) is a unique piece of primitive self-analysis. Speck demonstrated "The Family Hunting Band as the Basis of Algonkian Social Organization" (*Amer. Anth.*, 1915, 289). The area of southeastern United States has long been the despair of ethnologists because of the almost complete destruction of native cultures in colonial days. J. R. Swanton has achieved a magnificent success by adding to his special studies with *The Indians of the Lower Mississippi* (1911), the *Early History of the Creek Indians* (1922), and a comprehensive analysis, *Aboriginal Culture in the Southeast* (1928). He suggests that the tribes at the heart of the area (Creek et al.) have disrupted an earlier homogeneous culture area. Gower's study of Antillean culture (*Mem. Amer. Anth. Assn.*, 1927) shows that most of the island culture has been derived from South America.

An exceptional opportunity to study an uncontaminated Arctic group resulted in Jenness's *Life of the Copper Eskimo* (1922). Thalbitzer's further publications on the Ammassalik of Greenland now makes this the most fully described Eskimo group. *An Anthropo-geographical Study of the Origin of Eskimo Culture*, by Steensby (1917) bears out Boas's earlier theory that the Eskimo specialized their culture for sea hunting, moving out on the sea-ice, west of Hudson Bay. The hypothesis is confirmed by Rasmussen's discovery of caribou-hunting Eskimo in that district and especially by Mathiasen's finds of archaic Eskimo remains in the central archipelago and southward. Similar archaic cultures have been discovered from Alaska to Baffin Land.

Earlier work in the northwest coast has been supplemented by Boas's further study of the Kwakiutl, now perhaps the most voluminously described primitive people. The work of the Canadian government on the west coast tribes, interrupted by the War, has unfortunately not

been published. Sapir has sketched some results, however, in *The Social Organization of the West Coast Tribes* (1915). Gunther's *Kiallam Ethnography* (1927) is the first full study of a Washington tribe. *Archaeological Investigations in the Aleutian Islands*, by Jochelson (1926) fail to reveal any trace of ancient migrations to America by that route.

The Californian area is far from completely surveyed, yet Kroeber's *Handbook of the Indians of California* (1925) will long remain a model for areal studies. It appears that this area is not culturally homogeneous, as was formerly believed, but comprised four subcentres; that in the Northwest affiliates with the northwest coast, the otherwise distinct southern coast and Colorado River with the Southwest, while the central valley contains culture of the Great Basin type. Kroeber maintains that the central-valley culture represents the ancient undifferentiated form which once prevailed over the entire area, the local types to the north and south being subsequent elaborations (*The History of Native Culture in California*, 1923). Detailed studies of California tribes by Kroeber, Gifford, and others appear in the *Univ. Calif. Publ. Amer. Arch. Ethn.* Schenck, in a model archaeological report on the Emeryville shell-mound, casts doubt on the great antiquity formerly ascribed to the Californian culture (*idem*, 23, 1926). The adjoining Great Basin area is barely known beyond Lowie's *Notes on Shoshonean Ethnography* (1924).

The Southwest was investigated as early as 1885, but it is only within the last two decades that appreciable progress has been made toward consolidating the finds in this richest of North American areas. Ethnographic work among the Pueblos by E. C. Parsons (*XXI Int. Cong. Americanists*, 1926) establishes the common background of their intricate ritualism; Kroeber demonstrating the like for social organization in an analysis of *Zuni Kin and Clan* (1917). Strong sees relations to their social system among tribes as distant as south central California (*Amer. Anth.*, 1927). Apache linguistics by Goddard are available, Reichard's *Social Life of the Navajo* (1928); and a comparative study of *Havasupai Ethnography* (1928), by Spier. The prehistory of the region is now better known than that of any similar primitive area, thanks to the brilliant method proposed by Nelson in 1916. The development of historic Pueblo culture can be traced from a semi-nomadic base, which while it received germs of its agriculture, stone house building, pottery, weaving, and ritualism from Mexico, nevertheless developed in comparative isolation (A. V. Kidder. *Introduction to Southwestern Archaeology* 1924; see also a revision in *Science*, 1927, 489). The earliest culture (Basket Making) is placed tentatively at 1500 or 2000 B.C., the final shrinkage of the Pueblo area at about 1100 A.D. Kroeber emphasizes the importance of a non-Pueblo culture centre in northern Sonora and southern Arizona (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 23, no. 9).

The several centres of higher civilization in middle America are viewed by Kroeber as special developments from a common basis. These centres reduce on analysis to two, Peru and Mexico-Guatemala. The earliest Peruvian cultures resemble that of the Maya, but the subsequent history of the two areas shows little interconnection. The growth of these civiliza-

tions from an Archaic horizon has been outlined by Gamio, Kroeber, and Spinden (*Ancient Civilizations of Mexico and Central America*, 1917). Gamio's "Sequence of Cultures in Mexico" (*Amer. Anthro.*, 1924, 307) is (1) the Archaic, (2) Teotihuacan or Toltec, a fusion of the first with a Northern culture, (3) Maya, derived from this, and (4) Aztec, widespread and deriving its intellectual rather than material culture from the Teotihuacan. Kroeber has further analyzed the subject in *Archaic Culture Horizons in the Valley of Mexico* (1925). While Spinden thinks the Archaic horizon (which is, incidentally, roughly equivalent to Pueblo culture and not at all primitive) extends even into South America, Lothrop has been unable to identify it in Costa Rica and Nicaragua. *An Introduction to the Study of the Maya Hieroglyphs* (1915), by Morley, presents the mathematical notation of the Maya in an elementary way, while Spinden's *The Reduction of Mayan Dates* (1924) surveys what has been learned from these ancient remains of Yucatan.

Since 1914 there has been witnessed an attempt to reduce drastically the approximately eighty linguistic stocks north of the Isthmus. This has more than philological interest since historical connections are implied by such groupings. Kroeber and Dixon led the way in 1914 by reducing the twenty-one California stocks recognized by Powell to five: Penutian, Hokan, Shoshonean, Algonkian, with only Yuki as an isolated tongue (*Linguistic Families of California*, 1919). Kroeber also classes Serian and Tequistlatecan as Hokan (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 11, no. 4). This radical result was obtained by accepting Sapir's identification of Yurok and Wiyot as Algonkian and of Yana as Hokan (*Amer. Anth.*, 1913, 617; *Univ. Calif. Publ. Amer. Arch. Ethn.*, 13, no. 1). He revived Brinton's theory of a Uto-Aztecan stock uniting Shoshonean and Nahuatl, and combined Athapaskan, Tlingit, and Haida into one Nadene family (*Jour. Soc. Américanistes de Paris*, 1913, 379; *Amer. Anth.*, 1915, 534). Sapir's tendency was toward a marked break with the traditional classification, but he did not go to the extreme of P. Radin's *Genetic Relationship of North American Indian Languages* (1919), which reduced all to one grand stock.

Protests against particular combinations were voiced by Michelson, Goddard, and Uhlenbeck. The last maintains that Reichard's *Wiyot Grammar*, which appeared (1925) since Sapir wrote, shows no certain Algonkian affinities (*Intern. Archiv. für Ethn.*, 28, 153; *Mededeelingen der Koninkl. Akad. van Wetenschappen*, 1927, 233). Boas's strictures were of more fundamental nature. He questioned the legitimacy of synthesizing these languages, since it can be shown that phonetic and grammatical elements are distributed over continuous areas among languages of widely divergent stocks (*Amer. Anth.*, 1920, 367; *XXI Int. Cong. Americanists*, 1926, 305).

The useful "Bibliography of American Folklore, 1915-1928" (*Jour. Amer. Folklore*, 1928, 1) by A. Lesser, covers the period of this survey.

**South America.** The most noteworthy advances in the South American field have been in unraveling the archeology of Peru and in a series of comparative studies coördinating the ethnology of the continent. Ethnographic studies of consequence have appeared for Tierra del Fuego, the Amazon-Guiana district, and the

Chaco (Argentina-Bolivia). Much of the work in the South American field is that of European scholars whose reports are commonly to be found in the *Journal de la Société des Américanistes de Paris*, edited by P. Rivet. No satisfactory summary is available, in default of which there is C. Wissler's *American Indian* (2d ed., 1922), R. Karsten's *Civilizations of South America* (1927), and T. W. Danzel's *Handbuch der Präkolumbischen Kulturen in Latein Amerika* (1927).

Investigations of Koppers and Gusinde among the Yagan of Tierra del Fuego (*Unter Feuerland-Indianern*, 1924) revealed that the ceremonial life of these people was not so rude as their material existence suggested. Initiatory rites, secret societies, and masks were discovered. Earlier scanty data on their material culture was supplemented in S. K. Lothrop's *Indians of Tierra del Fuego* (1928). This author, in line with prevailing opinion, looks on the Fuegian culture as similar to that of the earliest ancestral Indians. An important survey, "Culture Diffusion and Culture Areas in Southern South America," by J. M. Cooper (in *XXI Int. Cong. Amer.*, 1926, 406) represents the archaic culture of the region as like that of the present Fuegians, somewhat differentiated east and west of the Cordillera. This was subsequently overlaid by a southerly drift of traits as far as the Araucanians on the west and the Tehuelche on the east. Local differentiation occurred in the extreme south; later influences brought the plank boat down the west coast and the horse through Patagonia.

The Amazon-Orinoco Basin has produced several detailed studies, all too rare from South America. *Animism and Folklore of the Guiana Indians* (1915) and *The Arts, Crafts, and Customs of the Guiana Indians* (1924), by W. E. Roth, cover the tribes between the Orinoco, Rio Negro, and lower Amazon in a thorough manner. Supplemental for this area is W. C. Farabee's *Central Arawaks* (1918) and *Central Caribs* (1924), and T. Koch-Grünberg's *Von Roraima zum Orinoco* (1917-1923). The Indians of Colombia are described by K. T. Preuss (*Forschungreise zu den Kágaba*, 1926); of Ecuador, by S. A. Barrett (*The Cayapa Indians*, 1925), and of the Amazon Country, by T. Whiffen, (*North West Amazons*, 1915).

The nearest approach to a general survey for South America is E. Nordenskiöld's series, *Comparative Ethnographical Studies* (1919-1928), which are so replete with information as to make a summary difficult. A convenient introduction to the ethnographic literature is to be found in vol. ii. While Nordenskiöld's field work has been largely on the borders of Bolivia, Brazil, and Argentina (*Forschungen und Abenteuer in Südamerika*, 1924), his perspective is always continent-wide; witness, *The Ethnography of South America as Seen from Mojos in Bolivia* (1924). Nordenskiöld maintains reserve toward Rivet's and Schmidt's thesis of an Oceanic origin of South American culture.

The proponents of the Oceanic theory maintain that much of the Amazonian and southern South American culture is of Melanesian and Polynesian origin. To the earlier dicta of Graebner and Schmidt that their Oceanic culture-strata can be identified in South America (see *ETHNOLOGY*), has come the adhesion of Rivet, Verneau, and others. P. Rivet claims the Tehon language of Patagonia to be closely al-

lied to those of Australia and Hokan (of western North America) with Melanesian-Polynesian tongues (*Bull. Soc. Ling. de Paris*, 28, 23; *Jour. Soc. Amér. de Paris*, 18, 141). The evidence is far from convincing to American linguists. Similarly, it is doubted that there is justification for asserting the affiliation of the "Lagoa Santa race" with Oceanic types (*Anthro. Papers, Amer. Mus. Nat. Hist.*, 23, Pt. 7). Contrary to the assertion of E. von Hornbostel that the scales of Pan's pipes in the Solomon Islands were identical with those of Peru and Brazil, C. W. Mead has shown that there is no correspondence save in an accidental case (*Musical Instruments of the Incas*, 1924). Rivet has developed an elaborate system of migrations to sustain his theories (*XXI Cong. Int. Américanistes*, 1926, 1).

The delineation of culture succession in Peru is more substantial than these inferential and even speculative attempts at culture history. Uhle and Kroeber are agreed that the earliest known culture (Pre-Tiahuanaco) is that of Nazca on the coast and Chavin in the northern highlands. This is a full-fledged, highly elaborate culture, and in no sense primitive. Tello holds, however, that this was preceded by an archaic culture, known typologically but not placed by stratigraphy. The fishing culture found by Uhle at Ancon and Supe looks primitive but may not be early. Tello stresses the influences of the interior on the coast in the earlier periods. Following Pre-Tiahuanaco, Kroeber and Uhle place Tiahuanaco, Pre-Inca, and Inca as successive cultures. Pre-Inca is a period of local coast developments; Inca, a highland culture intrusive on the coast, terminated at the Spanish advent. There is no reason for assuming that Nazca is more ancient than 1500 years. Uhle claims traceable similarities to Peruvian culture as far north as the Maya area and even to the Toltecs and Mississippi Valley, but this must be met with reserve. (Kroeber, *Univ. Calif. Publ. Amer. Arch. Ethn.* 21; *Amer. Anth.*, 1927, 626; Uhle, *Anales Univ. Central del Ecuador*, 36; Tello, *Introducción a la Historia Antigua del Perú*, 1922).

Asia. Except in so far as Russian sources hitherto inaccessible may be concerned, the Siberian literature remained somewhat weak in monographic contributions. There is nothing to compare with the classic works of Bogoras and Jochelson on the Chukchi and Koryak published early in the century. To these studies on the Palaesiatic tribes of northeastern Siberia, Jochelson added a series on the Yukaghir and the Yukaghirized-Tungus. This investigator believes that the resemblances of Palaesiatics to North American Indians indicates a counter migration to Asia. Laufer's discussion of *The Reindeer and its Domestication* (1917) shows the interrelations of the Siberian tribes. The reindeer was probably domesticated by the Southern Samoyed of Lake Baikal circa 300 A.D. From this centre, its use spread westward to the Lapps, perhaps not earlier than the tenth century, and eastward among the Palaesiatic tribes (see also Hatt, *Notes on Reindeer Nomadism*, 1919). A useful handbook of the social and religious customs of *Aboriginal Siberia* was issued by M. A. Czaplicka (1914), who followed it with a special account of *The Turks of Central Asia* (1918). The south Siberians of the Bronze and early Iron ages were identified by her with the Turks, in agreement with Laufer.

The home of the Turks seems to have lain in southern Mongolia, while the region now called Turkistan was peopled by Iranians.

The original continuity of Chinese culture with Near Eastern cultures in antiquity is insisted on by B. Laufer (*Some Fundamental Ideas of Chinese Culture*, 1914). Laufer has gone far to document his contention in a series of special studies, such as a demonstration that Chinese porcelain (*The Beginnings of Porcelain in China*, 1917) developed indirectly out of a glazing technique derived from the West. His *Sino-Iranica* (1919) traces the myriad cultural connections between these regions. He establishes beyond a doubt that many borrowings were made by and from the supposedly isolated Chinese. Shirokogoroff, in his *Chimification of The Social Organization of the Manchus* (1924), has shown the change as progressive. China was long thought to have had no stone age, its culture history beginning with the Bronze epoch. Nelson and Andersson, however, have discovered several Neolithic horizons (*Geol. Survey of China Bull.*, 5; *Amer. Anth.*, 1927, 177). On the aborigines to the east is Torii's "Les Ainou des Iles Kouriles" (*Jour. Coll. Sci., Imp. Univ. Tokyo*, 1918).

Relatively little new material has appeared on the aborigines of India. The isolated Andamanese have received the attention of A. R. Brown (*Andaman Islanders* 1922). Like other Negrito peoples, the culture of the Andamanese is simple, lacking clans and totemism. Pottery and the outrigger canoe may be acquisitions since the Andamanese reached the islands, but antedate the linguistic differentiation Brown found there. Their isolation is obvious in all phases of their culture. A series of descriptions are newly available for Assam and Burma: Gurdon's *The Khasis* (1914), Hutton's *Angami Nagas* (1921) and *Sema Nagas* (1923), Smith's *Ao Nagas* (1925), and Marshall's *Karen People of Burma* (1922). Milne's *Home of an Eastern Clan* (1924) refers to the Palaung of the northern Shan states. The Negritos of Malacca were the subject of a sketch by Schabesta (*Bei den Urwaldwergen von Malaya*, 1927).

Information on the East Indies is somewhat scattering. Evan's *Among Primitive Peoples of Borneo* (1922) provides data on the northern sector. Kaudern has begun an analysis of culture elements in Celebes. Collet's *Terres et Peuple de Sumatra* (1925) is a survey and Schröder's *Nias* (1917) detail, on an island group. Improved information on another island group is Loeb's *Mentawai Social Organization* (*Amer. Anth.*, 1928, 408) and Kruyt's *De Mentawaiers* (1923).

It is unfortunate that for the East Indies there is no summary corresponding to Kroeber's *Peoples of the Philippines* (1919) which provides a culture history for that archipelago. Cultural differences and physical types alike suggest the presence of three primary strata. The earliest inhabitants were Negritos, who may have extended over the East Indies as well, but whose original culture is unknown. The primitive Indonesian culture which followed has also not remained intact, but is represented in the mountains of Luzon. The culture of the Malaysians who followed in turn may at first have been similar or may have entered the islands already heavily charged with the Hindu elements it contains. At any rate, there was then an overlay

successively of Hindu, Mohammedan, and Spanish influences. Of special studies, Barton's *Ifugao Law* (1919), backed by his *Ifugao Economics* (1922), gives a surprising picture of an elaborate legal code among a people where no political machinery exists. This is referable to the Indonesian stratum. So are other studies, such as Benedict's *Bogobo Ceremonial, Magic, and Myth* (1917), Cole's *Traditions of the Tinguian* (1915), and Garvan's *Material and Sociological Culture of the Manobo* (1927).

Something of a survey for the whole continent is found in Buxton's *Peoples of Asia* (1925).

**Oceania and Australia.** Although the Oceanic languages (except Australian) form a group with those of the East Indies, the Malayo-Polynesian, several distinct culture provinces are recognized: Polynesia-Micronesia, Melanesia-New Guinea, Australia-Tasmania.

More fresh material has been added to Polynesia than to any similar expanse in the world, largely by the instrumentality of the Bishop Museum in Hawaii. While the ostensible interest is in unraveling the migrations in the Oceanic area, its excellent monographic material is free from theoretical prejudice. For areas with typical Polynesian culture, there are the Tongan data of Gifford and Marquesan of Linton and Handy to add to the early missionary accounts. Skinner portrays the Moriori of Chatham Is. as a marginal group. The first volume of K. von den Steinen's *Die Marquesaner und ihre Kunst* (1925) describes tattooing. Williamson's survey, *The Social and Political Systems of Central Polynesia* (1925), describes the variations from a Samoan norm. The dual organization of this region is ascribed to the influx of a conquering people, following River's theory. Material on Micronesia offers little beyond Erdland's *Die Marshall-Insulaner* (1914).

A host of studies of Melanesia have appeared, chiefly from English authors. Chief among these are a group on the Trobriands, by Malinowski (*Argonauts of the Western Pacific*, 1922; *Crime and Custom in Savage Society*, 1927; *Sex and Repression in Savage Society*, 1927), among whom were found the peculiar physiological theories concerning birth held also by the Australians. Thurthwald's *Banaro Society* (1917) gives a detailed account of the intricate social system of a Papuan people. Among synthetic studies is Rivers's *History of Melanesian Society* (1914), whose thesis of the coalescence of migrating groups forming a dual structure is reflected in Humphrey's *The Southern New Hebrides* (1926).

A new survey was put under way in Australia and has produced both synthetic and descriptive studies. In 1919 Schmidt provided a classification of Australian languages (*Die Gliederung der Australischen Sprachen*) which, however, was impaired by his injection of the culture-strata hypothesis. Kroeber's survey, "Relationship of the Australian Language" (*Jour. Proc. Roy. Soc. New South Wales*, 1923) agrees as to their unity in a single stock but presents a somewhat different picture of their grouping. Spencer's *The Arunta* (1927) is an expansion of his work on the typical central natives, while his *Native Tribes of the Northern Territory of Australia* describes an atypical group lacking the rich ritualism of the former. The study of West Australia received an accession in Brown's "Notes on the Social Organization of the Australian Tribes" (*Jour. Roy. Anth. Inst.*, vol. 48, 222).

**Africa.** The culture area concept which has served North American ethnographers so well has been applied to Africa by Herskovits. In his "Culture Areas in Africa" (*Amer. Anth.*, 1924, 50) he defines south of the Mediterranean littoral; the Hottentot and Bushman areas, Congo, East African cattle area, East African Horn, the Desert area, western and eastern Sudan, and Egypt, each with a characteristic culture. Madagascar also has been divided into subculture areas by Linton (*Amer. Anth.*, 1928, 363); East coast (fishing and local subs.), plateau (rice terracing; feudal system), and the west coast and south (cattle; absolute monarchy).

Meinhof's and Westerman's linguistic investigations have been followed by Johnston's *Comparative Study of the Bantu and Semi-Bantu Languages* (1922), surveying not less than 274 distinct languages. A new series of distribution studies in material culture has been begun by Lindblom (Stockholm, 1926-28). A comprehensive view of African religion, especially that of the Bushmen and the agricultural Bantu, is C. Meinhof's *Die Religionen der Afrikaner* (1926). An excellent preliminary outline is "African Negro Music," by E. von Hornbostel (*Africa*, 1928, 30).

Most of the new descriptive material from this continent is from British domain in West Africa, pertaining in part to Congo culture, in part of the Sudan. Rattray's accounts, *Ashanti* (1923) and *Religion and Art in Ashanti* (1927) are exceeded in detail only by Talbot's *Peoples of Southern Nigeria*, each a mine of information. F. von Luschan's monumental work, *Die Altertümer von Benin* (1920), argues the independent character of Benin art, despite suggested connections between southern Europe and the western Sudan. An approximation to an absolute chronology for the antiquities of Benin was suggested by Struck (*Zeit. für Ethnol.*, 1923), who sets an Archaic period from the twelfth to fourteenth centuries A.D., an Early period to 1500, and the Great period to 1691. Thomas's *Anthropological Report on the Ibo-Speaking Peoples* supplements our knowledge of the western Sudan. On the basis of cephalic index and magical customs on the White Nile, Seligman holds (*Jour. Roy. Anth. Inst.*, 55, 15) that there has been an eastward movement of the southern Sudanese.

The earliest inhabitants of the northeast Congo were Pygmies according to Czekanowski (*Forschungen im Nil-Kongo Zwischen-Gebiet*, 1917-24), who were followed by Bantu from the Congo, who in turn were replaced by Madis, Azandes, and others. Joint influences of Bantu and Sudanese features are seen in the life of Uganda (*The Lango*, by Driberg). R. P. van Wing's *Etude Bakongo* (1921) and Torday's *On the Trial of the Bushongo* (1925) are of the Congo proper.

Eastern and southern Africa is surveyed by Herskovits (*Amer. Anth.*, 1926, 230). The culture of this area centres in large part in a cattle complex; the cattle figure as wealth, dowry, sacrifices, etc. These features are found everywhere in the area but enter into varying relations with other elements. Uganda tribes were recently reported in *The Bagesu* (1924), *The Bakitara*, *The Banyankole* (1927); and also *Northern Bantu* (1915), by Roscoe. *The Ila-Speaking Peoples of Northern Rhodesia*, by Smith and Dale (1920) describes a typical cattle peo-

study of limited areas, with a minimum of pure speculation. Much less emphasis has been placed on tracing connections between remote areas, although these were not barred on principle. Of late, there has been some tendency to connect distant elements in the two Americas by Wissler (*The Relation of Nature to Man*, 1926) and to give a preponderance of credit to the centres of higher civilization of Middle America for the more cultivated arts of the peripheral regions by Kroeber (*Anthropology*, 1923).

More important is the fact that historical reconstruction is not considered the all-in-all of ethnological study, but the starting point for inquiries into the nature of cultural growth. Wissler's studies of Plains Indian costumes show, e.g., the manner in which traits of a material nature are welded to form new cultural entities; Spier's study of the sun dance is primarily concerned with the differential nature of diffusion and the sources of ceremonial elaboration. The historical and psychological aspects of the spread and growth of the Peyote cult have been discussed by Radin (37th Ann. Rep., Bur. Amer. Ethnology, 1923). These factors of cultural dynamics have been systematically outlined by Lowie in *Culture and Ethnology* (1917), Boas et al. in *Anthropology in North America* (1915), Wissler in *Man and Culture* (1923), and Dixon in *The Building of Cultures* (1928).

Studies from this point of view look on culture as a set of habits by which the original nature of man is patterned in conformity with the modes of behavior of the society in which he finds himself. The older ethnographies described cultures as though they were patterns of thought and action to which every individual in the particular society conformed absolutely. A change has appeared in more recent ethnographies, due partly to the recognition that conflicting testimony by natives could not always be harmonized, but chiefly to the realization that new customs arose from the variant behavior of individuals. Cultures are now thought of as dynamic, not static; no account of standard practices does justice to the ferment in culture. One such protest against the typological exposition is Malinowski's *Crime and Custom in Savage Society* (1926). Considering the variability of human nature, it hits wide of the mark to speak of an "automatic submission" of the savage to the dictates of his community. The individual has a wide variety of mutual obligations to his fellows: he is subject to conflicting codes and compulsions of varying degree. His personal experience determines how far he conforms or evades. Examples of such conflicts and the atypical behavior which may lead to new cultural norms are found in the native autobiographies now on record. Most noteworthy of these is Radin's *Autobiography of a Winnebago Indian* (1920). The same writer insists further on variability in his discussion of *Primitive Man as Philosopher* (1927), finding the same distribution of mentality and temperament in all societies, primitive and modern. Hence, the thinker, rationalizer, and sceptic make themselves felt in even those societies commonly viewed as containing only dull conformists. Quite a different approach to the interaction of cultural patterns of thought and individual states is Mead's comparison of the adolescent girl in Samoa and in modern America (*Coming of Age in Samoa*, 1928).

It must not be assumed that this approach is confined to American students; Marett, independently of any school, suggested, if he did not himself cultivate, similar lines of research in his *Psychology and Folklore* (1921). Rivers, a psychologist and physiologist by early training, devoted some papers to this subject, but was led in later years to devote himself to historical reconstruction. Two others in England, Radcliffe-Brown and Malinowski, have espoused a view, which they describe as "functionalist," not so different from that of the Americans. This has been more clearly enunciated by Brown in his "Methods of Ethnology and Social Anthropology" (*South African Jour. Sci.*, 1923, 124). Their concern is not to seek origins, but by induction to summarize in the form of general laws those interrelations which hold between the various phases of culture. For example, with respect to totemism, Brown holds that primitive societies ritualize things important to their social life (e.g., economically important plants and animals by a hunting people), and that in segmented societies (i.e., with clans, etc.) each segment has corresponding observances of this type. It is doubtful, however, that Brown's formulation for *The Andaman Islanders* (1922), e.g., is anything more than a vaguer statement of what he has described in detail in the same work.

Progress also has been made since 1914 in a number of special fields. The traditional view of the unilinear evolution of social organizations was reiterated by Hartland in his *Matrilineal Kinship and the Question of its Priority* (1917) and his *Primitive Society* (1921). This was countered by Lowie, who showed in *The Matrilineal Complex* (1919) that it is a logical, not a historical entity. Lowie's *Primitive Society* (1920) showed further that there is no necessary priority of either maternal or paternal structures: that each has grown independently of the other from a "loose" family organization as a result of factors stressing one of the other lines of descent. Such factors as unilateral residence, inheritance of property, etc., nascent in many loosely organized societies, may operate to this end without that "grand reformation" conceived by that arch systematist, Morgan. Spier's "Suggested Origin for Gentile Organization" (*American Anthropologist*, 1922, 487) adduces such a case. The important point is that such sibs (clans, gentes) are the result of specific historic causes in each section of the world where they are found and not due to any inherent and unilinear trend. These have been established by Strong, e.g., in "An Analysis of Southwestern Society" (*American Anthropologist*, 1927, 1), while Parsons and Boas have shown for the southwest and northwest coast areas, respectively, that the mixed patrilineal-matrilineal features of intermediate zones were due to mingling of patrilineal and matrilineal social forms segregated at their peripheries (*American Anthropologist*, 1924, 340). Kroeber pointed out that the similarities of Pueblo structure are due to diffusion (*Zuni Kin and Clan*, 1917). An attitude similar to Lowie's was taken by Schmidt, whose culture-strata scheme rests on the assumption that patrilineal and matrilineal societies have had different origins, hence that a discussion of their priority is futile. Rivers, as well, moved from the unilinear view of social development, holding that such a form as a dual organization in Melanesia resulted from migra-

tion and cultural conquest (*History of Melanesian Society*), and going so far as to evoke diffusion for many or most like instances (*Social Organization*, 1924).

Kinship proved a topic of interest in earlier years. Rivers's *Kinship and Social Organization* (1914) vindicated the correlation between social customs, especially marriage forms, and relationship terms. Lowie established the validity of this for North America in *Historical and Sociological Interpretations of Kinship Terminologies* (1916). An important result of this discussion was the systematic collection of kinship systems in this area which resulted in such analyses as Gifford's *Californian Kinship Terminologies* (1922) and Spier's *Distribution of Kinship Systems in North America* (1925). The latter discriminates eight types of systems, each with continuous distribution over a broad area.

An attack on the assumption of the old school that private property did not exist in primitive societies was also made by Lowie (*Primitive Society*), which in one form or another was shown to exist even on the rudest levels. In the same work he showed, contrary to Morgan and Maine, that the germs of political organization also existed in the form of the territorial bond and fraternal associations, but in his *Origin of the State* (1927), he was less inclined to see importance in the latter factor.

Progress is less substantial in the field of religion. As part of his culture-strata scheme, Schmidt held that a belief in a relatively pure monotheism was one of the archaic religious tenets. He projected a series of religious concepts conformable with each stratum (*Der Ursprung der Gottesidee*). Lowie's approach to *Primitive Religion* (1924) was comparable to his pluralistic view of social origins, in that he, too, was unable to find basis for unilinear developments. His special contribution was an insistence on joint historical and psychological analyses. Attention also was centred on individual variability. For example, it was suggested that the nature of visions is partially fixed by the sensory character of the visionary's imagination. This led to a consideration of psychic associations, wherein individual and socially determined connections of ideas bring about the rationalization of theology and the growth of ceremonialism. The growth of ritual in North America was discussed by the same author (in *Anthropology in North America*, 1915), and in a restricted area by Spier (*Sun Dance of the Plains Indians*, 1921). Totemism continued to hold interest in the earlier years of this period, Schmidt arranging an international symposium in his journal *Anthropos*. Goldenweiser receded from his earlier admirable stand that totemism, having no fixed content, must not be regarded as a single socio-religious expression. In "Form and Content in Totemism" (*American Anthropologist*, 1920, 280) and *Early Civilization* (1922), he took the position that it is characterized by "the association of the totemic content with a clan system," which contravenes what he had already proven with respect to the fluctuating content and its lack of connection with exogamic groups.

Perhaps nowhere does Boas's concern with the conditions under which cultural traits take form find better expression than in his treatment of his subject in *Primitive Art* (1927). Since all art contains both formal and significant elements, we cannot assume that the expression of emo-

tional states, a mere desire to create the beautiful, is the beginning of art. The problem consists in ascertaining whence the formal element is derived and how significance attaches to it. Some part of the formal element, the art style, is derived from technique and its control, which flourishes in virtuosity. Symmetry may be due to sensations of symmetrical manual movements; rhythms in space may be really rhythms of time. Since acquisition of technical control in itself brings pleasure, it may be that we have here the original impulse to æsthetic expression. A desire for graphic representation may take the form of realism, or by abbreviation, fixing only on essentials, that of symbolism. Where these two exist together, a transfer of significant meaning may occur. From this point of view, the unilinear sequences, conceived by Haddon and Holmes, from realism to symbolism and vice versa, appear unfounded. (See, e.g., van Scheltema, *Die Attnordische Kunst*, 1923). Styles develop by the selection of differing principles of symbolic representation and composition in realistic art, and by differing formal elements in geometric art. Boas's thorough study is documented not only by his own work but that of his students, e.g., Haegerlin's "Types of Ceramic Art in the Valley of Mexico," and Reichard's "Complexity of Rhythm in Decorative Art" (*Amer. Anth.*, 1919, 61; 1922, 183).

Primitive literature, the folk tale and myth, have come in for even a greater share of study than art, but less with respect to their æsthetic qualities than their form and history. In America, this also is the result of Boas's stimulation, whose theses are also summarized in his *Primitive Art*. It has been abundantly established by Boas, Lowie, and Waterman that folk-tale material is in a constant state of flux, due primarily to the diffusion and incorporation of incidents, plots, motifs, etc. This is subject to reinterpretation according to the prevailing modes peculiar to each culture. Among recent special studies confirming this may be cited: Reichard's "Literary Types and Dissemination of Myths" (*Journal of American Folklore*, 1921, 289), Boas's *Kutenai Tales* (1918) and Gunther's *Klamath Folktales* (1925). Boas has gone further in his *Tsimshian Mythology* (1916) inquiring how the culture, thought, and passion of a people find expression in their tales. The "Stylistic Aspect of Primitive Literature" (*Journal of American Folklore*, 38, 329) has also been scrutinized by Boas. Repetition, frequently rhythmic, is universal in tales, hence must be laid to the common psychic habits of man. On the other hand, the similarity of literary traits which are common to large areas but not universal, must rest on historical factors; such are proverbs, riddles, epic poetry, and moralizing tales, which are common in the Old World but unknown in the New. Similarly, motives of tales are not alike in all areas, nor the tendency to combine distinct tales, but are historically determined by the diverse cultural interests in each area. A different approach to this problem is Radin's *Literary Aspects of North American Mythology* (1915). The rôle of myths in the life of a people was sympathetically described by Malinowski (*Myth in Primitive Psychology*, 1926) and by Smith and Dale (*The Ilu-speaking Peoples of Northern Rhodesia*, 1920).

Several world-wide surveys of language have been attempted, of which Meillet and Cohen's

*Les Langues du Monde* (1924) was undoubtedly the most satisfactory. Broader groupings were proposed than heretofore; for example, Delafosse insisted on a fundamental resemblance of the welter of Sudanese languages with Bantu, the most widespread stock of Africa. On the other hand, Schmidt's *Die Sprachfamilien und Sprachkreise der Erde* (1926) was an attempt to make the groupings of stocks, and even grammatical categories, conform to his culture-strata, a conclusion which linguists in general are not prepared to accept. Sapir also has fathered a movement for a drastic reduction of the number of American Indian Stocks recognized, to which Boas offers a salutary warning ("Die Klassifikation der indischen Sprachen," in *XII Int. Cong. Americanists*, the Hague, 305). Boas shows that a number of phonetic and grammatical elements are distributed over continuous areas among languages of widely divergent stocks. This means that these elements tend to spread, rather than that two stocks with the same element were differentiated from a common prototype. In fact, the number of early stocks must have been much greater than at present, rather than that modern stocks are developed from a few languages.

A wholly new approach in *Language* (1921) has been broached by Sapir, which bids fair to revolutionize general linguistic studies. He stresses not only the unconscious character of linguistic usage, but insists that however unconscious this may be, it conforms to patterns, both grammatical and phonetic. "This means that there is something like an ideal linguistic entity dominating the speech habits of each group, that the sense of almost unlimited freedom which each individual feels in the use of his language is held in leash by a tacitly directing norm." The clustering of sounds in phonetic patterns is significant, not so much because of their motor or acoustic resemblance, as that the relational gaps in such a series are necessary to the psychological definition of the sounds (*Sound Patterns in Languages*, 1925). Speech-sounds of a dialect tend to run in a certain habitual groove, so that whatever change these sounds undergo, they nevertheless conform to the general system of sounds. But the system itself is subject to "drift," the reasons for which are obscure but lie in the "genius" of the language. At any rate, their movement is not random but in a definite direction. This would explain parallel developments occurring in related languages long after their separation.

The inroads of psychoanalysis into other fields are discernable in anthropology, although the permanent effect does not seem appreciable. Freud finds "that the beginnings of religion, ethics, society, and art meet in the Oedipus complex." His *Totem and Tabu* (1919) explains these by acts within the primeval horde; the sons having been prevented by their sire from sexual indulgence, slew him, but an ambivalent tenderness, replacing their hate, took the form of remorse. "They undid their deed by declaring that the killing of the father substitute, the totem, was not allowed, and renounced the fruit of their deed by denying themselves the liberated women." Thus totemism and exogamy are accounted for.

While the importance for culture of that part of the psychoanalytic doctrines which stresses the influence of experiences of the early life of the individual on his later acts cannot

be denied, this particular historical reconstruction cannot stand (see Kroeber, *Amer. Anth.*, 1920, 48). Malinowski, among others, has successfully challenged this formulation, showing among other things, that the Oedipus complex is not universal (*Sex and Repression in Savage Society*, 1927). Thus, in the Trobriands, matrilineal organization of society produces a stress and neuroses of quite different character from those of patriarchal or paternally dominated societies. Seligman, accepting Jung's classification of psychic types, classes various peoples as introvert or extravert ("Anthropology and Psychology," in *Jour. Roy. Anth. Int.*, 54, 13). Thus, the Nilotic Dinka for their aloofness, gravity, religiosity, and lack of interest in the white man are classed as introvert; the Palaeasiatics of Siberia, noted for dissociation and with typical savage instability of opinion, are extravert. This is an interesting classificatory device, but must not be construed as a historical explanation. See ANTHROPOLOGY; ETHNOGRAPHY.

**ETTINGER, MAX** (1874- ). A German composer, born in Lemberg. Because of protracted illness, he did not begin the serious study of music until 1899, in Berlin, and in the following year removed to Munich, where he attended the Conservatory. He wrote a string quartet; a quintet for woodwind and piano; a violin sonata; a cello sonata; *Suite and Träume* for orchestra; *Weisheit des Orients* for soli, chorus, and orchestra; many songs; and the operas, *Judith* (Nuremberg, 1921), two one-act operas, *Der eifersüchtige Trinker* and *Juana* (Nuremberg, 1925), *Clavigo* (Leipzig, 1926), and *Frühlings Erwachen* (Leipzig, 1928).

**ETTLINGER, ETLING-ER, KARL** (1882- ). One of the foremost humorists of Germany, born in Frankfurt, who became editor of the magazine founded by the late Georg Hirth, *Jugend*. Among his numerous works were *Der neue Martial* (1905); *Ovids Liebeskunst* (1905); *Das Tagebuch eines glücklich Verheirateten* (1906); *Unsere Donna* (1907); *Der neue Juvenal* (1907); *In Freiheit dressiert* (1908); *Streifzüge eines Kreuzvergnügten* (1910); *Die Hydra*, a comedy (1911); *Scherzo*, a one-act play (1913); *Mister Galgenstrick* (1915); *Aus frohem Herzen* (1915); *Benno Stehkragen* (1917); a volume of war verse, *Lieder eines Landsturmmannes* (1919); *Das Verhältniss* (1920); *Die duldsame Eva* (1921).

**EUCKEN, OTK'EN, RUDOLPH CHRISTOPH** (1846-1926). A German philosopher (see Vol. VIII). After 1914 he published *Geistige Forderungen der Gegenwart* (1918); *Der Sozialismus und seine Lebensgestaltung* (1920); his autobiography, *Lebenserinnerungen, ein Stück deutschen Lebens* (1920), and *Ethikals Grundlage des Staatsbürgerl. Lebens* (1924). The first three works were translated into English.

**EUGENE, T-J'EN, ARCHDUKE** (1863- ). An Austrian soldier, born in Moravia. In his earlier years he served in the army, but retired on account of ill health. At the outbreak of the World War he again entered the service, and after the Austrian retreat in Serbia in 1914, was given command of a portion of the Austrian troops. After the entrance of Italy in the War, he commanded the southwestern front, and achieved great success at Isonzo and elsewhere. He retired from active service in January, 1918, and moved to Switzerland.

**EUGENICS.** The term eugenics has come into common usage and as usually understood

means applied human genetics. Genetics (see HEREDITY and ZOÖLOGY) is primarily concerned with heredity as a biological phenomenon and is a true experimental science, but, since for obvious social reasons experiments in human breeding are impossible, geneticists give the problems of human heredity little attention. Several organizations and a few institutions have devoted themselves to the consideration of the results obtained by the study of heredity in general, in the effort to apply them to man, or at least to point the way to the betterment of human stock.

The aims of eugenists and their analyses of the present trend vary widely. In general, they assume that heredity is more potent in human behavior than social factors; that certain races and individual types are more desirable than others; and that eugenical breeding will eliminate the "unsuccessful," the poor, diseased, and criminal. Their programmes take several forms. By some, certain races are held superior; others should be eliminated or refused entry to the country, and miscegenation should be prevented. Another programme would eliminate strains having hereditary defects by sterilization or prohibiting their marriage. A third method looks to selective mating, in which superior strains would be encouraged to propagate more freely. In a succinct article, "Eugenics" (*Scientific Monthly*, November, 1916), F. Boas points out that eugenists do not discuss impersonally whether certain features are due to heredity or environment. For example, it is not clear whether alcoholic and criminal tendencies in certain families are due to heredity or to continuing social maladjustment. He holds that the same social functions and participation in the same culture are open to varied biological types.

In the United States, health boards and charity commissioners began to advocate legislation for the segregation and sterilization of incompetents and delinquents as early as 1910. Laws were passed in 1913 authorizing the sterilization of the unfit in North Dakota, Michigan, Kansas, Oregon, Wisconsin, California, and Iowa. During the same year, legislation restricting marriages were enacted in England, Spain, New Zealand, and elsewhere. In the United States, fifteen States had passed such laws by 1924, though much of this legislation was inoperative. The greatest stimulus to the general consideration of eugenics was the Wisconsin Marriage Law of 1913, which required medical certification for all who applied for licenses. This brought on a nation-wide discussion and attempts at similar legislation in other States.

An International Eugenics Congress was held in London in 1912. Owing to the World War, this congress was not reconvened until 1921. Several similar gatherings have been held since. While Great Britain and the United States were among the earliest nations establishing eugenical organizations, others have appeared in all leading European and Latin American nations, in Japan, and in China. Sweden was the first nation to set up an institute for race-biology. In 1918 the University of Upsala subsidized the research of H. Lundborg into the lineage of peasant families, and he received small grants from the Government. His researches were so promising that in 1921 the Riksdag established the institute without a dissenting vote. The result of his investigations among soldiers were published in 1926 under the title *The Racial Characters of the Swedish Nation*.

One form which the narrow nationalism of the war years took was an exaggerated expression of eugenical doctrines, so perverted and prejudiced as to be distinctly prejudicial to the best interests of the eugenics movement. Gobineau's *The Inequality of Human Races*, which originally appeared in 1853, was republished in 1915 to rationalize war prejudices. Other characteristic works of like tenor were M. Grant's *The Passing of the Great Race* (1916), H. S. Chamberlain's *Le plus récent philosophe du pangermanisme mystique* (1917), and L. Stoddard's *The Rising Tide of Color Against White Supremacy* (1920) and *Racial Realities of Europe* (1924). A judicious analysis and criticism of these extremists will be found in F. H. Hankins, *The Racial Basis of Civilization*, (1926).

The examination of recruits to the United States Army during the War was the first opportunity to take stock of physical well-being and psychological status on a large scale. Marked differences were found among various racial, national, and local groups in their performance of psychological tests. These are discussed by R. M. Yerkes, *Psychological Examining in the U. S. Army*, (1921) and Yoakum and Yerkes, *Army Mental Tests* (1920). This work led to such extravagant expressions as C. C. Brigham's *A Study of American Intelligence* (1923). While the purpose of these tests was to find soldiers with special capacities for particular work, the contrasts noted were interpreted as significant of racial differences. Among typical results were the following (by percentages of each group above, at, or below the middle score):

	Below	Middle	Above
Englishmen	9	71	20
White draft, generally	24	64	12
Italians	63	36	1
Poles	70	30	0.5
Negroes, generally	79	20	1

These values show Negroes at the bottom of the list; but as Kroeber points out (*Anthropology*, 1923) suspicion is aroused by the fact that Italians and Poles stand much nearer the Negroes than to other whites. A different tabulation shows other results:

	Below	Middle	Above
Negroes, Northern States	46	51	3
Italians	63	36	1
Negroes, Southern States	88	14	0.3

Further, comparisons of literates and illiterates show that New York Negroes are nearly on a par with Alabama whites, among literates, and a bit ahead of them among illiterates. "Evidently, the psychological tests are more a gauge of educational and social opportunity than of race." Annual summaries on race differences appear in *The Psychological Bulletin*.

The Army examination also showed a surprisingly high proportion of physical defectives. They were not uniformly distributed over the country, nor by race and nationality, so that social causes may be suspected. Consult Love and Davenport, *Physical Examination of the First Million Draft Recruits* (1910); *Defects Found in Drafted Men* (1920). A general programme for aims and results in studying the whole population is F. Boas's "Report on an Anthropometric Investigation of the Population of

the United States" (*Jour. Amer. Statistical Assn.*, 1922, 181).

While the alarmists had the public ear so long as war passions held sway, there has been a return to saner views in later years. Typical of this is F. H. Hankins' *The Racial Basis of Civilization* (1926). He does not deny all the importance of social and cultural factors in race achievement, but holds that race itself has some part, indeed a considerable part, in cultural development. Races are not equal in native endowment; they have fundamentally the same capacities, but they have these qualities in different degrees of development. He believes in the capacity but not the unique value of the Nordics, in the definite inferiority of the Negroids, but not of the Alpines and Mediterraneans, and insists on the overlapping of all human groups. There is no living group that is a "pure race," not even the Nordics; but instead of viewing this fact with consternation, he points out that the interbreeding of good stocks is to be encouraged. For in this way, the variability of groups is increased, with the appearance of leaders of heightened degrees of intelligence at the upper end of the range, and even new and valuable combinations of endowment appear. So far as the internal composition of our population goes, he holds no alarmist view that the less successful elements should be stamped out, or removed from controlling the social structure by some caste system, but rather that our concern should be with creating better conditions for the more successful to continue their contribution to the biological strain. Applied as an immigration policy: "America could do no better than to make itself a world asylum for persons of superior quality regardless of race or color."

Exemplary caution also characterizes S. J. Holmes's *The Trend of the Race* (1921) and *Studies in Evolution and Eugenics* (1923). In his view, however, so long as the evidence on good or evil effects of race-crossing is conflicting, it were preferable to discountenance it.

**Bibliography.** The literature on eugenics is enormous, as is indicated by the huge *Bibliography of Eugenics* (1924) compiled by S. J. Holmes, and new accessions are appearing at an increasing rate. A brief selection of the more recent significant works in this compendium was published by the American Eugenics Society, (1925). Among recent works are L. Darwin, *The Need of Eugenic Reform* (1926); R. Pearl, *The Biology of Death* (1922); E. B. Reuter, *Population Problems* (1923); L. I. Terman, *Genetic Studies of Genius* (1925); Estabrook and McDougall, *Mongrel Virginians* (1926); H. H. Laughlin, *Eugenic Sterilization in the United States* (1922); H. Olson et al., *Research Studies in Crime* (1925); J. W. Jenks and W. J. Lauck, *The Immigration Problem* (1926); and the current issues of *The Eugenics Review*. See **RACE PROBLEMS**.

**EULENBURG**, oî'lén-böörk, FRANZ (1867- ). A German economist; born and educated in Berlin. He began teaching in Leipzig in 1899. From there he went to Aachen. In 1919 he became professor of political economy and statistics in the University of Kiel and in 1921 in the Handelshochschule, Berlin. His works include: *The Possibility and Results of a Social Psychology* (1900); *Society and Nature* (1905); *The Modern Philosophy of History* (1907); *The International Money Market* (1908); *The Rise in Prices during the Last Ten Years* (1912);

*Money in War* (1915); *The New Industry* (1919); *Arten und Stufen der Sozialisierung* (1920), and *Weltwirtschaftliche Solidarität der Völker* (1922).

**EUPEN, MALMÉDY, and MORESNET.** To satisfy Belgian demands for protection and for reparations, Articles 34-39 of the Treaty of Versailles provided for the cession to Belgium by Germany of the frontier districts of Eupen (area 68 square miles; population, 26,156), Malmédy (area 314 square miles, population, 34,768), and the disputed neutral district of Moresnet (area 2 square miles; population, 3038), together with a small portion of Prussian Moresnet. The regions in question had undergone steady Germanization since their acquisition by Prussia in 1815, so that the end of the War saw the original Walloon population so reduced that only one-sixth of the population could speak French. To the Peace Commissioners, other considerations were weightier than the question of language, which made the transfer of territory justifiable. Aside from the strategic argument, it was maintained that the orientation of the districts was toward Belgium, that there were profound historical ties, and that the necessity for compensating Belgium for the forests destroyed during the War favored the decision. For this last reason, too, Germany was compelled to turn over to Belgium the domanial and communal woods of Prussian Moresnet.

**EUROPE.** The World War (1914-1918) and the revolutions in Russia, Austria-Hungary, and Germany which attended it led to a profound metamorphosis in European political geography. The cataclysmic changes registered in the peace settlement of Paris (1919-1920) with subsequent modifications and supplementary arrangements, surpassed in scope and significance such stages in the evolution of the modern state-system as were signalized by the Treaties of Westphalia (1648), the Peace of Utrecht (1713-1714), and the Congress of Vienna (1814-1815). The territorial readjustments following the World War involved directly or indirectly every state in Europe except Portugal, Spain, and Switzerland. Western Europe was little transformed, the most notable exceptions being Alsace-Lorraine and Ireland. Central and Eastern Europe, on the other hand, were almost completely reorganized on a national basis and to a large extent republicanized and democratized. The three great non-nationalistic empires of Austria-Hungary, Russia, and Germany were dismembered and the diminutive state of Montenegro disappeared. A solid belt of eight new national states emerged in Central Europe, viz: Austria, Hungary, Czechoslovakia, Poland, Lithuania, Latvia, Estonia, and Finland, while contemporaneously the respective national unifications of Italy, Serbia, Rumania, and Greece were virtually completed and the nationalistic grievances of France and Denmark adequately redressed through the restitution of Alsace-Lorraine and Northern Schleswig. Such, in broad outlines, was the territorial resettlement of Europe. See the articles on the various states of Europe.

**EUROPEAN CORN BORER.** See **ENTOMOLOGY, ECONOMIC**.

**EUROPEAN WAR, 1914-1918.** See **WORLD WAR**.

**EVANGELICAL CHURCH.** A denomination which is Arminian in doctrine; established in 1922 by the union of the Evangelical Association and the United Evangelical Church. The

Evangelical Association was the outgrowth of a religious movement started in Pennsylvania in 1800 under the direction of John Albright. Differences arose in the church culminating in a division in 1891, and a large number of ministers and members organized themselves into the United Evangelical Church in 1892. The separate existence of the two bodies continued until it was felt that the two churches should be reunited to find articulate expression, and a series of meetings of commissions, appointed to consider union and federation, resulted in a merger in 1922.

The Evangelical Association increased in number of communicants from 150,380 in 1914 to 167,416 at the time of the merging; the Sunday-school enrollment, from 227,820 to 271,758; and the valuation of church property, from \$11,699,452 to \$16,281,011. Similarly, the membership of the United Evangelical Church was increased from 79,292 in 1914 to 92,001 at the time of merging, and the total value of church property from \$5,476,602 to \$9,515,328. In 1928 the Evangelical Church had a total membership of 258,214; itinerant preachers numbered 173, and local preachers, 475. Sunday schools numbered 2849 and enrollment amounted to 372,943; church property was valued at \$39,682,707, and contributions during the year amounted to \$7,040,800, an average of \$27.31 per member. Missionary work, which has always been a dominant purpose of the denomination, found expression in local work and in the maintenance of foreign missions in Japan, China, Germany, Poland, Latvia, France, Switzerland, Russia, Africa, and Canada. The church also maintained the following educational institutions: North Central College and Evangelical School of Theology, Naperville, Ill.; Western Union College, Le Mars, Iowa; Albright College, Myerstown Pa.; Schuylkill College and School of Theology, Reading, Pa. Other philanthropic enterprises included two orphanages, six homes for the aged, and several hospitals.

#### EVANGELICAL SYNOD OF NORTH

**AMERICA, THE.** A religious communion, strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. Where they disagree, however, the Evangelical Synod adheres strictly to the passages of Holy Scripture bearing on the subject and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was organized in 1840 at Gravois Settlement, Missouri, and consolidated in 1877 with similar communions. The church is organized in 19 districts with extensive power of self-government. Presidents of districts, clerical delegates, and lay delegates meet in General Conference every fourth year. A quadrennial Conference was held in 1925 and an Extraordinary General Conference adopted a new constitution in 1927. In recent years, the organization has remained practically the same size, communicant members being estimated in both 1918 and 1927 at 350,000; there were 1131 pastors in the earlier year, and 1197 in the latter. The property of the 1400 churches in 1918 was valued at \$18,281,415, and the property of the 1267 congregations in 1927 amounted to \$38,463,860. In the United States, by 1927, there were over 100 missionaries, men and women, active in about 135 communities. The Board of

Foreign Missions reported an income of over \$171,522 for 1927, and had 14 men, two of them medical workers, and 18 women as missionaries in India, in addition to 333 native workers. In Honduras there were 11 missionaries at two stations. The denomination maintains four institutions of learning: Eden Theological Seminary, St. Louis, Mo.; Elmhurst College, Elmhurst, Ill.; Robinson Academy, Waco, Texas; and Oakland Institute, Cincinnati, Ohio. Periodicals published are *Der Friedensbote*, *The Evangelical Herald*, and *The Light Bearer*.

**EVANS, SIR ARTHUR JOHN** (1851- ). A British archaeologist (see VOL. VIII). He added to his studies of ancient Cretan civilization *Palace of Minos I*, published in two parts in 1922 and 1928.

**EVANS, EDWARD RADCLIFFE GARTH RUSSELL** (1881- ). A British explorer and naval officer (see VOL. VIII). In 1914 he commanded the *Mohawk* in the bombardment of the right wing of the German Army on the Belgian coast and in 1917 took command of the *Broke*. In 1921, as commander of the *Carlisle* (1921-23), he saved 228 Chinese from drowning in the Hong Mok disaster. He received the D. S. O. in 1917 and has been decorated by many governments and societies. He published *Keeping the Seas* (1920), and *South with Scott* (1921).

**EVANS, RUDOLPH** (1878- ). An American sculptor born at Washington, D. C. He studied at the Corcoran Art School, Washington, the Art Student's League, New York, Julien's Academy and the École des Beaux Arts, Paris. He was a pupil of Falguière and Rodin and was elected Associate of the National Academy in 1919, when he won the Watrous Gold Medal. His best-known sculpture is the "Golden Hour," the original of which is in F. A. Vanderlip's garden at Scarborough, N. Y., a copy in the Luxembourg Museum, and a marble replica in the Metropolitan Museum, New York. Mr. Evans has the capacity to catch in his portraits the aloofness of childhood. Besides portraits of young people, he has made monuments and portrait busts of financiers, including Frank A. Vanderlip, John D. Rockefeller, Jr., and Thomas F. Ryan. His superb "Boy and Panther" was exhibited in 1923.

**EVANS, WILLIAM** (1870- ). An American theologian, born at Liverpool, England, and educated in private schools in England and at the Moody Bible Institute (Chicago), the Chicago Lutheran Theological Seminary, and the Theological Seminary of the University of Chicago. He was ordained in the Congregational ministry in 1894, was director of the Bible course at the Moody Bible Institute (1901-15), associate dean of the Bible Institute in Los Angeles (1915-18), and director of Bible conferences for the United States and Canada (1918- ). He wrote *The Book of Books* (1902); *Personal Soul-Winning* (1910); *Studies in the Life of the Christian* (1911); *The Great Doctrines of the Bible* (1912, 1920); *Through the Bible*—Series of 10 vols. on Bible Exposition (1916-18; incomplete); *The Book Method of Bible Study* (1915); *Epochs in the Life of Christ* (1910); *The Shepherd's Psalm: a Meditation* (1921); *The Coming King: the World's Next Great Crisis* (1923).

**EVARTS, HAL G.** (1887- ). An American author born at Topeka, Kan. After a varied career as rancher, trapper, and licensed guide, he turned to writing. He published:

*The Cross Bull* (1920); *The Bald Face* (1921); *Passing of the Old West* (1921); *The Yellow Horde* (1921); *Fur Sign* (1923); *Tumble Weeds* (1923); *Spanish Acres* (1925); *The Painted Stallion* (1926); *The Moccasin Telegraph* (1927); *Tomahawk Rights* (1929).

**EVE, ARTHUR STEWART** (1862- ). A Canadian physicist, born at Silsoe, Bedfordshire, England. He was educated at Cambridge, and in 1903 became Macdonald professor of physics, McGill University, Montreal, Canada. He commanded the 148th Overseas Battalion in the World War, and was director of research, Admiralty Experimental Station, Harwich, 1917-18. In 1919 he became director of physics at McGill University. He has published various papers (mainly in the *Philosophical Magazine*) on radioactivity and ionization.

**EVERWIJN, JAN CHARLES AUGUST** (1873- ). A Dutch diplomat born at Noordwijk, Holland. He studied law at Leiden University, and was a lawyer at The Hague (1897), entering the government service in the following year. He was president of the Netherlands Organization for the International Chamber of Commerce (1920); delegate at the Paris Conference for economic relief (1920); and minister from the Netherlands to the United States (Aug. 1, 1921-July, 1922).

**EVJEN, JOHN OLUF** (1874- ). An American educator, born at Ishpeming, Mich., and educated at Augsburg Seminary (Minneapolis), the University of Minnesota, and the University of Leipzig. In 1903 he was ordained in the Lutheran ministry. He was professor of theology at Augsburg Seminary (1909-19); president of the State Normal School at Mayville, N. D. (1919-23); and professor of history and modern languages at Carthage (Ill.) College, (1923-24). In 1924 he became professor of theology in Hamma Divinity School, Wiltenberg College, Springfield, Ohio. He wrote *Scandinavia and the Book of Concord* (1905); *Lutheran Germany and the Book of Concord* (1911); *Scandinavian Immigrants in New York, 1630-1674* (1916); *Naadegaerne og Embedet* (1920); *The Teachers' College—Its Place in the Educational System* (1920); *The Berkenmeyer Library* (1925); *Work and Requirements of a Graduate School of Theology* (1926).

**EVOLUTION.** The belief that animals and plants now on the earth have arisen, not as was earlier supposed, through separate, independent, and more or less arbitrary acts of Creation, but through modifications of preexisting species, these from earlier species, and so on back to the origin of life, that being at present an unexplained mystery. For a summary of the evidence upon which this belief is based, consult article **EVOLUTION**, Vol. VII.

At the present time, while there is universal agreement among scientists in accepting the general theory of evolution, there is a decided lack of agreement as to the relative values to be put on the proposed explanations of the process. The condition is analogous to that of a Protestant and a Catholic who disagree on points of doctrine but agree on the fundamental principles of Christianity. In both cases, this lack of agreement seems to be due to differences of temperament or of training, but while in religion no such conclusion would be drawn, unfortunately in the case of evolution this lack of agreement is claimed by hostile critics to mean that the theory has been largely aban-

doned. When William Bateson, the British biologist, at the meeting of the American Association for the Advancement of Science in 1921, emphasized on the one hand his belief in evolution, but on the other hand stated that we are still ignorant concerning the way in which new species arise, William Jennings Bryan quoted the second statement (ignoring the first) as proof that biologists are abandoning the whole evolution programme or at least show such lack of agreement concerning it as seriously to discredit the theory. Again, Weismann, through his critical studies on the effects of use and disuse, founded the school calling itself "Darwinian," but who outdarwined Darwin in claiming natural selection as the *only* explanation. The practical abandonment of this extreme position has been misinterpreted by those who fail to realize that "Darwinism" in this sense is not the same as "Evolution." Obviously, the present-day problem is the discovery of the factors at work in the evolutionary process.

Of the various proposed explanations, natural selection is the one most generally employed, its severest critics having been forced to accept it as playing at least a subsidiary part. It would appear, however, that important modifications of the original theory must be made. In the first place, it is probable that the severity of the struggle for existence has been overestimated. "Nature is stern but she has her tolerant moods," and it is questionable if minor variations have the rigid life-and-death-determining importance they were formerly supposed to possess. If this is the case, we must discover some other cause for the origin of new species which often differ from the old in what seem to us unimportant structural details.

In the second place, difficulties arise through recently acquired information concerning the effects of selection on individual variations. Any group of plants or animals, considered with respect to any particular character, will show a considerable range of variability for that character, varying both above and below the mean or average. Darwin thought that selection of extreme variates above or below the mean and a breeding from these variates would result in a new range of variability in the selected direction and the establishment of a new mean. Practically all the results obtained by experiment along these lines have negated this conclusion, and it generally happens, if not always, that the offspring of an extreme variant normally arrange themselves around the mean of the whole race irrespective of the degree of variation of the parent.

A large number of zoologists join with botanists in ascribing the origin of new species and new adaptations to mutation, a position we very largely owe to the work of the botanist, De Vries. The mutation theory supposes that from some causes not fully understood but which certainly exist, there appear at intervals changes in the hereditary material such as to lead to the establishment of a new mean with a new range of variability. Such a change is called a mutation. A mutation may be very slight in amount, so as to resemble a mere individual variation, or it may be large as in the fruit fly, when the normal red eye is replaced by a white one. In any case it is recognizable by its heritability and its establishment of a new mean. It is believed that natural selection first operates after this mutation has appeared and determines

whether or not it shall survive. Natural selection, then, as De Vries has expressed it, "has nothing to do with the arrival of a species but determines its survival."

The oldest explanation of evolution is that of use and disuse, originally proposed by Lamarck, and to a large extent accepted by Darwin. With the rise of the "Darwinian" school, (as defined above) this Lamarckian factor seemed definitely to be disproved, but with the decline of "Darwinism" it has again come to the front. The main difficulty is to discover how it is possible for somatic changes to affect the germ plasm. Throughout the discussion there have been many who admitted this difficulty but who nevertheless felt that such a modification must have occurred, otherwise actually observed changes could not have taken place. Recent work on antibodies, hormones, X-rays, and radium, seem possibly to point the way to the desired explanation. See HEREDITY.

A conservative statement is that at the present time the theory of use and disuse is stronger than it has been since Weismann's work in 1889 seemed entirely to discredit it; not so much in its general acceptance (for before Weismann it was widely adopted in an entirely uncritical fashion), but in that there is now promise of an explanation of the mechanisms at work in such a process.

In a strictly natural selection explanation of evolution, it is assumed that from generation to generation variations normally appear in all directions around a mean, and natural selection operates by eliminating all but the most favorable of these. Eimer in insects and Whitman in pigeons found reason to believe that in these animals variations affecting any one organ or part show a decided tendency to occur in only one general direction, rather than in all directions. This principle, known as *orthogenesis*, has been proposed as an explanation of why, in many cases, organs so obviously disadvantageous to an animal, have persisted. It is, for example, generally thought that the enormous unwieldy horns of an Irish Elk were largely responsible for its becoming extinct. Spencer attributed the size of these horns to the inherited effects of use, but in this case it is difficult to see why natural selection should not have kept the size within limits by the elimination of the most unfavorable variations, and the consequent preservation of the fittest. Orthogenesis assumes an inherent tendency to vary in one direction even though the result is fatal to the race. Why variations should appear in only one direction is not, with our present information, any easier to explain than why variations should appear at all. In the last analysis, this must be referred to the unstable structure of protoplasm, though this is obviously a restatement, rather than a solution, of the problem. It is certain that orthogenesis sometimes occurs, and this fact should be kept in mind in any discussion of evolution.

Evidently, evolution has been an exceedingly complicated process, involving several causes, or factors, sometimes working singly, at other times in coöperation, and difficulties in interpretation have arisen because undue emphasis was laid upon one factor to the exclusion of others. It is quite possible that further research will bring to light factors at present unknown.

**Bibliography.** Recent works on evolution that may be consulted with advantage are H.

F. Osborn, *From the Greeks to Darwin*, rev. ed. (New York, 1929); H. W. Shimer, *Evolution and Man* (Boston, 1929); Frances Mason, ed., *Creation by Evolution*, a consensus of present-day knowledge by leading authorities (New York, 1928); H. H. Newman, ed., *The Nature of the World and Man* (Chicago, 1928).

See ANTHROPOLOGY; BOTANY; HEREDITY; ZOOLOGY.

**EWART, D'ART, JAMES COSSAR** (1851- ). A Scottish naturalist (see Vol. VIII). In 1927 he retired from the Regius professorship of natural history at Edinburgh University, a chair he had held since 1882. His later books include: *Domestic Sheep and Their Wild Ancestors* (1913); *Development of the Horse* (1915); *Moultling of the King Penguin* (1917); *The Nestling Feathers of the Mallard* (1921).

**EWELL, ARTHUR WOOLSEY** (1873- ). An American physicist (see Vol. VIII). He was appointed commanding captain of the United States Reserves on Dec. 15, 1917, and head of the bomb unit of the Air Service of the American Expeditionary Forces. After the Armistice, he was placed in charge of the experimental development and tests of bombs for the War Department.

**EWING, JAMES** (1866- ). An American pathologist (see Vol. VIII). In 1919-27 Dr. Ewing brought out his monumental work on tumors, entitled *Neoplastic Diseases*.

**EWING, SIR (JAMES) ALFRED** (1855- ). A Scottish physicist and engineer (see Vol. VIII). During the World War, he was in charge of the Admiralty department which successfully intercepted and decoded important German cipher messages. In 1916 he became principal and vice-chancellor of the University of Edinburgh. His latest work is *Thermodynamics for Engineers* (1920).

**EXCESS PROFITS TAX.** See TAXATION IN THE UNITED STATES.

**EXCHANGE, FOREIGN.** See FINANCE AND BANKING.

**EXPERIMENTAL PSYCHOLOGY.** See CONSCIOUSNESS AND THE UNCONSCIOUS. PSYCHOLOGY, EXPERIMENTAL.

**EXPERIMENT STATIONS, AGRICULTURAL.** See AGRICULTURAL EXPERIMENT STATIONS.

**EXPLORATION.** Although exploration did not cease during the World War and the years following, there was a noticeable diminution in the number of expeditions during the years 1914-1918. The War and the resulting changed conditions introduced new aims and methods of exploration. The use of the airplane, both as a medium of transportation and as a means of mapping, was the chief innovation. With the exception of the Polar Regions, no lands of great extent remained completely unknown and post-war exploration has concerned itself with investigating the natural resources of a particular region or with tracing its past. With the establishment of mandates, the nations applied themselves to ascertaining the climate, fauna, flora, mineral resources and soil conditions of their new possessions. Some studies of the natural environment were made to encourage emigration. American organizations, which have been especially active in the archaeological and ethnological fields, have initiated research and enlarged their collections for the use of scientists and public instruction. European institutions were practically forced to cease such activity during and immediately following the

War, but recently they have resumed their old position in the field of exploration.

**Africa.** See AFRICA, under *Exploration*.

**Arabia.** See ARABIA, under *Explorations*.

**Arctic Regions.** See POLAR RESEARCH.

**Asia.** Central Asia has been the goal of many expeditions. Andrews, for the American Museum of Natural History, conducted extensive geological and archaeological surveys in Mongolia with a view to ascertaining more about the early history of man. Sven Hedin returned again and again to his explorations in Tibet. Kosloff made some notable archaeological discoveries in the course of his Central Asian expeditions. Roerich made two expeditions to Tibet for the purpose of painting and collecting philosophical data. Sir A. Stein spent a number of years in the little-known parts of Persia, Afghanistan, and Baluchistan. Expeditions visited the Pamirs and mapped much of that intricate country. The Morden Clark Expedition of the American Museum of Natural History collected big game in Central Asia, as did the Roosevelts. A great number of Soviet expeditions have been sent to study the little-known natural resources and ethnology of the Soviet Republics in Asia. In Siberia, Obruchev discovered a range of high mountains; Professor Kulik headed an expedition which located an enormous meteor. The Lake Baikal region was the centre of intensified study. The Freer Gallery at Washington conducted several archaeological expeditions in China. In India, a German ethnological expedition made extensive observations. For archaeological investigations in Asia Minor, see ARCHAEOLOGY.

**Australia.** Extended exploration in Western Australia resulted in a more careful classification of the land. Utilization depends on rainfall and irrigation possibilities were investigated. The Great Barrier Reef Expedition studying the formation and economic potentialities of this huge coral reef began work. Several scientific institutions united for the purpose of studying the native life before advancing civilization destroyed their aboriginal culture.

**Europe.** Excavations in France and Italy disclosed ancient ruins of unknown periods. Ethnographic researches were made in southern France, northern Spain and the British Isles. The construction of a war railway to the Murman Coast brought information on the hitherto unknown region of the Kola Peninsula.

**North America.** **Alaska.** The U. S. Geological Survey kept a number of field expeditions engaged in reconnaissance work each year. Notable work was that of mapping the Naval Petroleum Reserve in northern Alaska and of S. R. Capps, who mapped much of the Mt. Spurr area. The National Geographic Society sponsored a survey under Jaggar in the volcanic area of southern Alaska. Hrdlicka in 1926 made a preliminary anthropological survey for the Smithsonian Institution and this was followed by more detailed studies. In 1928 the Stoll-McCracken Expedition of the American Museum of Natural History discovered some early mummies on an island in the Aleutians. The U. S. Navy sponsored an extensive aerial mapping expedition in 1926 which photographed much of the involved topography of southeastern Alaska.

**Canada.** The Northwest Territories were the scene of annual government patrols and explorations. Radical changes in the map of the

Great Slave Lake area have resulted. Surveys of the condition of game in this territory were made in order that provision for the natives might be made. Airplane surveys of much of the pioneer fringe of Canada were made. An airplane and ice-breaker expedition tested the practicability of Hudson Bay as a point of export for the Canadian grain crop. Mountain climbing expeditions have been numerous; Mount Logan was conquered; Mystery Mountain, the highest in British Columbia, was discovered and the Columbia Glacier was studied. The Canadian Arctic Archipelago was visited regularly by patrols of Royal Canadian Mounted Police and a steamer was regularly sent to Ellesmere Island and Baffin Island.

**United States.** In the United States, scientific field research is annually pursued by American universities, scientific societies, museums, and State and Federal bureaux. This field work covers all phases of investigation into our natural resources. Recently, there has been great activity along archaeological lines. See ETHNOLOGY. Some of the principal institutions sending their expeditions to all parts of the world are the Field Museum of Chicago, Museum of the American Indian, Heye Foundation, the American Museum of Natural History, the Pennsylvania University Museum, the Carnegie Institution of Washington, the National Geographic Society, and the Smithsonian Institution.

**Central America, Caribbean.** Study of the natural resources of these countries continued slowly. Archaeological investigations were the most significant, especially those in Yucatan, Guatemala, and British Honduras. The New York Academy of Science continued its study of the natural history of the Virgin Islands and Porto Rico. Barro Colorado Island in the Panama Canal developed into a centre for tropical research. Studies of sedimentation were initiated by Professor Field of Princeton. William Beebe continued his oceanographical studies.

**South America.** The Amazon Valley was the centre for a number of prominent expeditions. The Rice Expedition to the Rio Grande mapped some of its northern tributaries. Dyott retraced Roosevelt's expedition down the River of Doubt and later went into Matto Grosso to search for the missing Fawcett Expedition. Dr. and Mrs. Dickey made several ethnological trips into southern Colombia and Venezuela. Mr. Tate of the American Museum of Natural History collected birds and mammals at key points. The Captain Marshall Field Expeditions of the Field Museum made large palaeontological collections in Argentina. Mountain-climbing expeditions to the Andes have been numerous and recently the airplane has been used to map some areas in detail.

**Oceania.** The islands of the Pacific have been visited by many ethnographical and archaeological expeditions, particularly those from the Bishop Museum of Honolulu. The Whitney South Seas Expedition made large oceanographic collections. The Burden Expedition to Komodo collected giant lizards for the American Museum of Natural History. The Stirling Expedition of the Smithsonian Institution penetrated the unknown regions of New Guinea and discovered a pigmy race. A British Expedition up the Fly and Sepik rivers was also undertaken.

**Oceanography.** Marine biology particularly the breeding and growth and migration of edible fish occupied much of the attention of ocean-

ographers, as well as the more routine studies of currents, depths, and deposits. The United States thus investigated its own waters and European scientists, British, Danish, French and Swedish, explored the North Sea, the Mediterranean, and the Atlantic waters from the English Channel to Madeira. After 1914 the United States participated in an International Ice Patrol of the North Atlantic. The non-magnetic yacht, *Carnegie*, started on another cruise around the world.

**EXPLOSIVES.** Such developments of the World War as the tremendous increase in the expenditure of artillery ammunition for preliminary bombardment of objectives, in barrage fire for protection of infantry waves advancing to the attack, in harassing fire directed on enemy back-areas, in counter-battery work, in putting up aerial barrages to fend off enemy airplanes, and the enormous increase in the employment of machine guns in lieu of the slower-firing shoulder rifle, all magnified the rôle of explosives. Progress in their manufacture was mainly toward quicker manufacture, greater safety in handling, storage, and transportation, slower deterioration after manufacture, and substitution of more abundant raw materials for those found to exist in quantities too small for ready conversion on a hitherto unprecedented scale.

**Propellants.** Smokeless powder in various forms was in universal use prior to the War, and except for the substitution of wood pulp for cotton linters in the manufacture of nitrocellulose and the development of a water-drying process which was much quicker than the former air-drying process, no outstanding improvements in its manufacture were achieved during the War.

Probably the most important development work since the War was on a smokeless, flashless, non-hygroscopic powder. Immediately after the Armistice, demands were made for a new type of propellant powder to meet such conditions as those of the War. The particular objection to the service powder of the United States Army was that it was hygroscopic and must be kept in waterproof containers up to the time of use. Another very important factor was that it was a solvent powder, requiring considerable time for drying, even making use of the so-called water-drying process developed during the War. Several experimental powders of varying composition and granulation passed satisfactory tests. In order to obtain necessary ballistic properties and yet avoid the use of solvents, nitroglycerine in very small amounts was incorporated with the other ingredients. This powder can be fired within 48 hours after manufacture but greater uniformity is obtained by allowing it to age for several days. It is completely non-hygroscopic; samples have been fired immediately after submersion in water for 24 hours.

**Bursting Charges.** Just prior to the War, trinitrotoluol (TNT) was considered the most satisfactory bursting charge for mobile artillery shells. Because of the scarcity of TNT during the War, a fairly satisfactory substitute was developed and used, 80% amatol, a mixture of 80 parts of ammonium nitrate and 20 parts of TNT. Small-caliber shells were filled largely with 50% amatol, but at best, this was a temporary expedient; the standard practice in 1924 was to use TNT without dilution. The 80%

amatol was prepared by crushing and drying ammonium nitrate, melting TNT in steam-jacketed kettles, and mixing the two components in the required proportions in a steam-jacketed mixer.

The resulting product was similar to soft brown sugar and might be tamped into the shell cavity by hammer and mallet or, as was done during the War, by means of the screw shell-filling machine, which consists of a hopper to hold the amatol in bulk and a sleeve containing a rotating worm. The shell to be filled was mounted horizontally on a wheel carriage placed so that the worm and sleeve entered it within a few inches of the bottom of the shell cavity. The amatol was fed into the shell by the rotating worm until the resistance to the entrance of more amatol caused the carriage and shell to back off from the hopper, when the worm was automatically stopped, since the cavity had been filled to a predetermined point. The remaining cavity left by the sleeve and worm was filled with liquid TNT except for a small cavity to take the booster. See Coke.

Ammonium picrate, called explosive D in the United States service, is used for bursting charges of armor-piercing projectiles, since TNT is not sufficiently insensitive to shock to withstand passage through armor plate on impact without exploding. Ammonium picrate will do this and still be in condition to give effective fragmentation on perforation of heavy armor plate. In loading ammonium picrate in armor-piercing projectiles, small quantities of the crystalline explosive are given a preliminary amount of tamping in the nose of the shell, followed by hydraulically pressing successive increments as needed to fill the shell cavity completely and with proper density. The bursting charge for shrapnel continued to be black powder, according to standard practice prior to the War. The ammunition used with trench mortars developed during the War was filled with a nitrostarch explosive for the smaller calibres and either 80% or 50% amatol for the larger calibres. Hand grenades were loaded principally with nitrostarch explosives, and rifle grenades with TNT. Aircraft bombs were loaded with 80% amatol during the War; subsequent practice was to use TNT without dilution.

**Booster Charges.** During the War, attempts were made to load boosters with tetryl around the fuse socket, filling the remainder of the booster with TNT. This was abandoned in favor of completely filling the booster with tetryl. This practice later became standard with the Ordnance Department.

**Detonators.** Mercury fulminate maintained its position as the premier military detonator. It is manufactured by dissolving mercury in nitric acid, pouring the solution into grain alcohol, and removing and washing the gray crystals of mercury fulminate thus precipitated. Mercury fulminate is the most sensitive, most powerful, and most expensive of military explosives. It costs more than twice as much as tetryl and about five times as much as TNT. The bursting of an artillery shell is in reality a series of explosions. On impact with the ground the firing mechanism of the fuse delivers a minute flash to the mercury fulminate detonator. It detonates and transmits the explosive wave to the tetryl of the booster charge surrounding it. The booster in turn causes the detonation of

the TNT in the main bursting charge of the shell. By utilizing this step-up method, small quantities of expensive and highly sensitive explosives are used to set off successively larger quantities of less sensitive explosives. Consult McFarland, *Ordnance and Gunnery* (New York, 1929). See ORDNANCE.

**EXTENSION COURSES.** These courses are organized and conducted in many forms by a variety of American institutions, educational and other, and are part of a general adult-education movement which has been greatly accelerated since the World War. Since the early nineties, the universities of the U. S. have been gradually developing an extension programme. For a great many years, extension courses were limited in most institutions to instruction by correspondence. This form of extension teaching was developed particularly by the University of Chicago and various large State universities of the Middle West. More recently, extension classes have been organized in large numbers and have attracted enormous enrollments particularly in the large urban universities. These classes are held in the late afternoons, evenings and on Saturdays for the benefit of those who through other occupations cannot accommodate themselves to the requirements of the usual formal curriculum. A popular development has come in the form of short courses in subjects of interest to a particular social, industrial, or professional group.

There is considerable difference of opinion as to the advisability of giving academic credit for extension teaching. In some institutions, partial credit toward an academic degree is granted; that is, a certain proportion of the total number of credit points necessary before a degree is awarded may be taken through the medium of extension courses. This proportion varies even in the institutions where credit is allowed, but the maximum credit allowed at any institution is 50 per cent.

The popularity and usefulness of extension courses is reflected in the heavy registrations, particularly in the large centres of population. California, Columbia, Pennsylvania and New York University have made remarkable strides in this field and the growing interest in adult education as a whole is an indication that the number enrolling each year will increase rather than decrease.

In both England and America, university extension began with lectures in the field of the physical sciences. There is practically no limitation of the scope of the subjects taught at the present time; and in addition to topics usually associated with a liberal-arts programme, there are many demands for instruction of utilitarian value solely. Extension teaching has therefore been one of the most important direct public-service arms of a modern American university which conducts it. Fields represented in the average extension curriculum are agriculture, the ancient languages, art, astronomy, chemistry, commerce, economics, education, engineering, English, geography, geology, German, history, household arts, law, mathematics, music, the natural sciences, philosophy, physiology, psychology, religion, the romance languages, and sociology. The subjects of the short courses, for which academic credit as a rule is not given, are limitless.

Extension centres in towns within reach of the educational facilities of the large universities have grown in considerable numbers and extramural work has come to be one of the regular arms of extension teaching. In some cities these centres have regular equipment, buildings and laboratories of their own and separate administrative and teaching staffs are built up. State universities arrange for this extramural work extensively, and with the development of the possibilities of radio in education, extension teaching can be carried on simultaneously over an entire State area. Another modern tendency is to provide post-graduate professional training. This is possible chiefly in cities where hospital, library, and laboratory facilities are available.

Methods of administration and conduct of extension courses vary widely. The authorities at some institutions feel that, to be of greatest value and usefulness, extension teaching should be just as much a responsibility of the central educational authority as any other form of teaching. At other institutions, it is a policy to regard extension teaching as a specialty and a separate faculty and a separate corps of administrators is set up. At institutions where extension teaching has proved its value, instructors of all academic grades, from lecturer to full professor, conduct classes. Enrollments are drawn from almost every section of the population, and ages vary from the late teens to the sixties and even to the seventies. The most popular subjects are those in education, chosen largely by teachers in an institution which gives academic credit for extension work; in English, business, engineering, and the sciences, where they are offered; and general liberal-arts subjects.

That extension courses have come to stay and that they will undergo further development is well demonstrated by the existence and activity of the National University Extension Association, the membership of which includes upward of forty universities which have long conducted one form or another of extension teaching and which are constantly seeking to study and interpret the special fields in which their activities are engaged. This association meets annually and publishes a report of its proceedings which include discussions and reviews of current extension undertakings.

It was estimated that the total number of registrations in extension courses in colleges and universities in the United States in the year 1928-29 was approximately 300,000. See EDUCATION IN THE UNITED STATES.

**EXTENSION TEACHING IN AGRICULTURE.** See AGRICULTURAL EXTENSION WORK.

**EYRE, LAURENCE** (?- ). An American actor and playwright born in Chester, Pa. He made his debut with the Castle Stock Company in Boston in 1907, played with Julia Marlowe, and also leading characters with the Ben Greet Company. His best-known plays include: *The Things That Count* (1914); *Sævus Madaeus* (first full-length play dealing entirely with Negro life, in which all the characters are colored, to be produced in America) produced at Atlantic City (1916); *Driftwood* (1917); *Mis' Nellie of N'Orleans* (1919); *Martinique* (1920); *The Merry Wives of Gotham* (1923); *One Trip of the Silver Star* (1925). *Mis' Nelly of N'Orleans* was also produced by Dion Boucicault later in London.

**F****AESI, ROBERT** (1883- ). A Swiss poet, essayist and dramatist, who was born in Zurich and studied at the university there and in Berlin. After some years of travel in France, Italy, Russia, and England, he returned to Zurich and published *Zuricher Idylle* (1908), *Odysseus und Nausikaa*, a tragedy (1911), *Die offenen Türen*, (1912), and *Die Fassade* (1918), comedies. He wrote verse: *Aus der Brandung: Zeitgedichte aus der Schweiz* (1917), and compiled two anthologies of Swiss poetry: *Gestalten und Wandlungen* (1920), and *Anthologia Helvetica* (1921). His most important critical works were *Paul Ernst und die Neueren Bestrebungen im Drama* (1913), *Karl Spitteler* (1917), *Rainer Maria Rilke* (1919), and *Schweizerischer Dichtung* (1922). In 1922 he became professor of German literature at the University of Zurich.

**FAGAN, JAMES BERNARD** (1873- ). An Irish dramatist (see VOL. VIII), who usually wrote comedy. His later plays were *The Wheel* (1922), *And So To Bed* (1926), and *The Great Lover* (1927).

**FAHEY, JOHN H.** (1873- ). An American banker and newspaper publisher, born at Manchester, N. H. After receiving a high-school education, he became a reporter in Manchester. He was editor and publisher of the *Boston Traveler* 1903-10, finally becoming president of the Boston Traveler Company and of the State Publishing Company. He also was president and publisher of the *Worcester Post*. He was president and publisher of the Manchester (N. H.) *Mirror*, 1922-25, and publisher of the *New York Evening Post*, 1923. In 1919-20, he was chairman of the organizing committee of the International Chamber of Commerce, and served as American director of the same body, 1921-26. In the same period, he was a member of the Senior Council of the United States Chamber of Commerce.

**FAHRENKROG, fä'rën-krög, LUDWIG (CARL WILHELM)** (1867- ). A German poet-painter, born in Rendsburg. He studied at the art academies of Hamburg and Berlin and spent some years in Italy. His mural paintings soon attracted attention, among them "Youth as the Golden Age" in the Girls' High School of Barmen, "Crucifixion" in Mulheim, and "Descent of Christ to Hell" in Kiel. He made a sensation at the Munich Exhibition of 1902 with his "Christ Preaching," in which he presented a beardless Christ, an innovation which he subsequently justified in his writings. He has since become better known as an author. His literary works are *Geschichte Meines Glaubens* (1906); the dramas *Baldur* (1908), *Woland* (1914), *Nornegast* (1921), and *Die Godentochter* (1921); the poems *Lucifer* (1917) and *Das Goldene Tor* (1921), the latter illustrated by himself; a history of God-lore, *Gott im Wandel der Zeiten* (1921); and *Deschaim Mahavira* (1925).

**FAIRBANKS, CHARLES WARREN** (1852-1918). An American politician, Vice President of the United States, 1904-09 (see VOL. VIII). In 1914 he was chairman of the Indiana Republican State Convention for the third time. In 1916 he again received the Republican nomination for the Vice Presidency but was defeated.

**FAIRBANKS, DOUGLAS** (1883- ). An American actor, born in Denver, Colo. He first appeared on the stage in New York in 1901. On the legitimate stage, he played *Hawthorne of the U. S. A.*, *Frenzied Finance*, *All For a Girl*, *A Gentleman of Leisure*, *Henrietta*, *The Show Shop*, and others. After 1916 he headed his own motion-picture productions. His chief successes include *His Majesty the American*, *When the Clouds Roll By*, *The Mollycoddle*, *The Mark of Zorro*, *The Nut*, *The Three Musketeers*, *Robin Hood*, *The Thief of Bagdad*, *Don Q.*, and *The Black Pirate*.

**FAIRCHILD, BLAIR** (1877- ). An American composer, born at Belmont, Mass. Simultaneously with his academic studies at Harvard University, he took courses in composition under J. K. Paine and W. R. Spalding; later he studied piano with G. Buonamici in Florence. He went to Constantinople in 1901 as a member of the American Legation and thence to Persia. Finding that Persian music interested him more than his diplomatic duties, he went to Paris in 1903 for further study under Widor and Gannaye. His style is a combination of French impressionism and Oriental elements. Among his works are a ballet pantomime, *Dame Libellule* (Paris, 1921); the symphonic poems, *East and West*, *Zöl*, *Shah Feridoun*; a sketch for orchestra, *Tamineh*; *Légende* and *Étude Symphonique* for violin and orchestra; a violin sonata; two piano trios; a string quartet; a piano quintet; six Psalms for soloists and chorus a cappella; two fugues for organ; and many songs, almost all on Oriental themes.

**FALKENHAYN, fälk'ën-hîn, ERICH VON** (1861-1922). A Prussian general, born at Burg Belchau, in Thorn. He entered the army in his youth and became military attaché to the legation at Paris in 1887. In 1889 he acted as military instructor and favorite of the Crown Prince of Germany and Prince Eitel Friedrich. He served in China during the Boxer Rebellion. He was promoted to lieutenant general and was made Prussian Minister of War in 1913. In 1914 at the outbreak of the World War, he became chief of the general staff of the army, and later general of the infantry. He upheld the officers whose conduct in Alsace resulted in the Zabern disorders. He received the credit for the breaking through of the Russian lines at Gorlice-Tarnow in 1915, and also planned the successful Russian and Serbian campaigns of the same year. Insisting that the War must be fought out on the Western front, he opposed von Hindenburg and Ludendorff, who urged concentrating upon the Eastern front. The un-

successful attack at Verdun of 1916 caused his removal as chief of the general staff, Hindenburg taking his place. He was given the leadership of the 9th Army in its fighting at Hermannstadt, and in 1917 of the Asiatic Corps. In 1918 and 1919, the 10th Army was commanded by him. He wrote: *Die oberste Heeresleitung in ihren wichtigsten Entschliessungen 1914-16* (1919), giving an account of the German conduct of the War, and *Der Feldzug der 9 Armee gegen die Rumänen und Russen, 1916-17* (1921).

**FALL, ALBERT BACON** (1861- ). An American public official (see VOL. VIII). He was reelected to the United States Senate for the term 1919-23, but resigned in 1921 to become Secretary of the Interior at the request of President Harding. In June, 1921, the naval oil reserves were transferred to the Department of the Interior, and in 1922 Secretary Fall signed a long pending lease of the Teapot Dome oil district in Wyoming to the Sinclair oil interests, and also a lease of the Elk Hills reserves in California to E. C. Doheny, an oil magnate. Only about one-third of the oil was held for use of the Navy. Later, Fall resigned his secretaryship. In 1924 an investigation was begun by the Public Lands Committee of the Senate, and Fall appeared before a subcommittee and denied that he had received any money from Sinclair or Doheny, but on January 24, Doheny testified before the Committee that he had "lent" Fall \$100,000 without security or interest. On July 15, Fall was indicted on three counts, the first and third relating to the alleged \$100,000 payment, the second charging conspiracy with Harry F. Sinclair in regard to the Wyoming or Teapot Dome leases, and entering into contracts without bids. Fall and Doheny were acquitted by a jury in November, 1926, of charges of conspiracy in connection with the leasing of the Elk Hills reserves. Fall and Sinclair were brought to trial on the second count in October, 1927, but a mistrial was declared November 1 after the Government had charged agents of the defendants with shadowing the jurors. Sinclair was retried and acquitted in April, 1928. The United States Supreme Court, affirming decisions of the lower courts, decided on Feb. 28, 1927, that the Elk Hills oil leases had been corruptly obtained and that the property should be returned to the Government, and on October 10 that the Teapot Dome oil leases were fraudulent and void. Fall was again placed on trial in October, 1929, and was found guilty of accepting a bribe of \$100,000 from Doheny for the lease of the Elk Hills naval oil reserve in California.

**FALL, LEO** (1873-1925). A famous Austrian composer of operettas, born at Olmütz. After receiving training from his father, a bandmaster, he studied at the Vienna Conservatory. For some years, he was operatic conductor at Berlin, Hamburg, and Cologne. His first opera, *Frau Danise*, was produced in Berlin in 1902, but made little impression. A second opera, *Irrlicht* (Mannheim, 1905), did not fare much better, nor his first operetta, *Der Rebell* (Vienna, 1905). However, the latter, in a new version as *Der liebe Augustin*, later scored an enormous success (Vienna, 1911). In 1907 two operettas were brought out in Vienna, *Der fidele Bauer* (July 5) and *Die Dollarprinzessin* (November 2), which immediately made their way to all the theatres of Austria and Germany, and placed the composer in the front rank of

the masters of sparkling comedy. The new works, which had their première in Vienna, are *Die geschiedene Frau* (1908; in New York as *The Girl in the Train*, 1910), *Brüderlein fein* (1909), *Die schöne Risetta* (1910), *Die Sirene* (1911), *Der Nachtschnellzug* (1913), *Der süsse Kavalier* (1924). The following were first produced at Berlin: *Die Studentengrafin* (1913), *Jung England* (1914), *Der künstliche Mensch* (1915), *Die Rose von Stambul* and *Die Kaiserin* (1916), *Madame Pompadour* (1922), *Die spanische Nachtigall* (1924). For London, he wrote *The Eternal Waltz* (1911). A posthumous operetta, *Jugend im Mai* was brought out in Dresden (1926). In 1924 he visited the United States and witnessed the American première of *Madame Pompadour*.

**FALLA, MANUEL DE** (1876- ). A Spanish composer, born at Cadiz. He studied at the Madrid Conservatory under Tragó (piano) and Pedrell (composition), and while still a student wrote several zarzuelas which he offered to the managers in vain. Unable to obtain a hearing in his native land, he went to Paris in 1907, where, after some hard years, Debussy and Dukas became interested in him. After his first opera, *La Vida Breve*, written in 1904, had been successful in Nice (1913) and Paris (1914), it was brought out in several cities of Spain and won recognition for the composer. De Falla then settled in Granada. Although not a prolific writer, he is the acknowledged leader of Spanish futurists. His other works are the ballets, *El Amor Brujo* (Madrid, 1915), and *El Sombrero de Tres Picos* (London, 1919), and *El Relablo del Maese Pedro* (Madrid, 1923); three pieces for orchestra, *Noches en los Jardines de España*, *En el Generalife*, and *Danza Lejana*; and piano pieces and songs.

**FALL RIVER.** A manufacturing centre and port of entry of Massachusetts. The population rose from 119,295 in 1910 to 120,485 in 1920 and to 134,300 in 1928 by estimate of the Bureau of the Census. In 1923 the city adopted the report of the city-planning board, prepared after its survey of the city begun in 1920. In 1920 the city-manager plan of government became effective. Fall River is the largest cotton manufacturing centre of the United States, the capital invested being \$50,000,000. Other manufactures include webbing, pianos, leather, belting, hats, jewelry, underwear, absorbent cotton, braids, twine, paper, boxes, and varnish. In 1925, 30,596 persons were employed in these industries and received \$28,241,000 in wages; the value of the products manufactured was \$142,885,000. The largest fuel-oil refinery in New England, of 1,000,000 barrels monthly capacity, was built at Fall River in 1922, but since that time has been changed merely to a terminal and distributing plant. In 1924 the first unit was begun of a power plant that would ultimately produce 275,000 horse power. Fall River has 27 wharves. In 1927 the total volume of its foreign commerce was 209,949 tons. The assessed valuation of property in 1927 was \$188,936,000; the net debt was \$9,893,000. On the night of Feb. 2, 1928, fire which started in old Pocasset Mills destroyed a great part of the business section of Fall River, with a loss of approximately \$4,000,000. The city has suffered from the depression in the textile industry.

**FARABEE, WILLIAM CURTIS** (1865-1925). An American anthropologist who was born in Washington, Pa. He was in charge of the de

Milhau Harvard expedition, 1913-16, of the University of Pennsylvania expedition, 1921-23, and curator of the Museum of the University of Pennsylvania since 1913. Besides his numerous contributions to anthropological and geographical magazines, he published *The Central Aravaks* (1918).

**FAR EASTERN REPUBLIC.** See **SIBERIA** AND **FAR EASTERN REPUBLIC**; **RUSSIA**; **JAPAN**.

**FARIGOULE, LOUIS.** See **ROMAINS, JULES**.

**FARMAN, far'män', HENRI** (1874- ). A French designer of aircraft (see **VOL. VIII**). He established the important factory at Billancourt which supplied many planes to the French and English armies in the World War.

**FARM BUREAUS.** See **AGRICULTURAL EXTENSION WORK**.

**FARM COOPERATION.** See **AGRICULTURAL CREDIT**; **COÖPERATION**.

**FARMING.** See **AGRICULTURE**.

**FARM INSTITUTES.** See **AGRICULTURAL EDUCATION**.

**FARM TRACTOR.** See **TRACTOR**.

**FARNELL, LEWIS RICHARD** (1856- ). An English archaeologist and writer on religion (see **VOL. VIII**). In 1919 and 1924, he was Gifford Lecturer in the University of Edinburgh, and in 1920-23 vice chancellor of the University of Oxford. His later works include *Outline History of Greek Religion* (1921); *The Attributes of God* (1925); and articles on Greek archaeology, philology, and religion in British and foreign journals.

**FARNÖL, (JOHN) JEFFERY** (1878- ). An English writer of romantic fiction, who was educated in a private school. He lived in New York City (1902-10), publishing a number of short stories and for two years painting scenery for the Astor Theatre. His publications include *The Amateur Gentleman*; *The Honourable Mr. Townish* (dramatized in 1924); *Some War Impressions* (1918); *Black Bartlemy's Treasure* (1920); *Peregrine's Progress* (1922); *The Quest of Youth* (1927); and *Gifford of Weare* (1928).

**FARRAND, LIVINGSTON** (1867- ). An American university president, born at Newark, N. J. In 1914 he became president of the University of Colorado, and held that position until 1919. During the World War he was director in France of the International Health Board, in 1917-18, and from 1919 to 1921 was chairman of the Central Committee of the American Red Cross. In the latter year, he was chosen president of Cornell University. He contributed many articles to psychological and anthropological publications and wrote *The Basis of American History* (1904).

**FARRAND, MAX** (1869- ). An American university professor and research director (see **VOL. VIII**). He resigned his professorship of history at Yale in 1925. He was director of the division of education of the Commonwealth Fund, 1925-27. Since 1927 he has been director of research for the Henry E. Huntington Library and Art gallery, San Gabriel, Calif. He published *Development of the United States* (1918) and *Fathers of the Constitution* (1921).

**FARRAR, GERALDINE** (1882- ). An American dramatic soprano (see **VOL. VIII**). At the height of her artistic powers, she retired from the operatic stage, appearing for the last time at the Metropolitan Opera House as Zaza, in Leoncavallo's opera, on Apr. 22, 1922. After the fall of the curtain, scenes of wild enthusiasm were enacted inside the house and on the street.

For 16 consecutive seasons, she had been one of the most popular artists of the company. In 1925 she tried, with enormous success, the field of light opera, appearing in Lehar's *The Love Spell*, and two years later also returned to the serious concert-stage. Since the sensational success of her film production of *Carmen*, in 1915, she has been increasingly active in this field. In 1916 she published an autobiography, *Geraldine Farrar* (Boston).

**FARRÈRE, CLAUDE.** See **BARGONE, FRÉDÉRIC CHARLES**.

**FARWELL, ARTHUR** (1872- ). An American composer, born at St. Paul. He studied with Norris in Boston, Humperdinck in Berlin, and Guilmant in Paris. From 1910 to 1913, he was director of municipal concerts in New York City, and from 1915 to 1918, director of the Music School Settlement there. He then moved to Pasadena, where he devoted much time to community music. He was always deeply interested in the music of the American Indians and at various times visited Indian reservations. In 1901 he established at Newton Centre, Mass., the Wa-Wan Press for the publication of American works, especially those based on Indian themes. He was the first recipient of the Composers' Fellowship awarded by the Pasadena Music and Art Association (1921). In his compositions, he employs chiefly Indian themes. He published collections of Indian melodies and folk songs of the South and West and was known as a writer on his subject, particularly through his former associate editorship of *Musical America*. In 1927 he was lecturer and conductor at Michigan State College.

**FASCISM.** Fascism (Italian, *fascismo*) denotes an ultra-nationalistic regenerative movement which played a prominent rôle in the post-bellum development of Italy, and which spread to Spain, Bavaria, and other countries. The central impulse of Fascism was nationalism, an ideal generating in turn the determination to extricate Italy from chaos, to give her moral unity, to make her a new state, and to make it an axiom and a creed with everyone that all social progress must be through and by the nation. Fascism came into power with dramatic suddenness. The first groups of Fascisti were formed in March, 1919, at the very moment when Italy's nationalist claims to Fiume were being disputed at Paris, while within Italy communist agitators were boldly preaching not only social revolution but also anti-militarism and pacifism. The two-fold aim of the original Fascisti was to suppress communism and exalt patriotism. Taking their names from the Latin *fascēs*, the bundle of rods wrapped round an ax to indicate power to punish offenders, the Fascisti assumed the right to enforce order by using violence against socialists and pacifists. Unlike members of the American Ku Klux Klan, the Fascisti did not conceal their identity; but like the Klan, they appreciated the emotional appeal of uniforms, organizations, and sonorously titled officers. Each active member of the Fascist organization wore a black shirt, oftentimes decorated with war medals; for many had fought with distinction in the World War. The organization was very elaborate, modeled on the ancient Roman imperial army. Strict discipline bound rank and file to obedience. And at the head of the movement was the forceful Benito Mussolini, a blacksmith's son, once a socialist, and later editor of the patriotic *Popolo d'Italia*.

During the early stages of the movement, two phases of activity were most notable. First and foremost, the Fascisti, as has been said, were patriots, superpatriots, and they expressed their loyalty to Italy by forcibly suppressing pacifist demonstrations, by conducting propaganda in favor of Italy's most extreme territorial claims to the Tyrol, Istria, Fiume, Dalmatia, Albania, etc.; and by inculcating a spirit of devotion, almost of worship, toward the national state. One very significant manifestation of this nationalist devotion was the scorching criticism which the Fascisti heaped on the "outworn and incapable governments which had become a menace to the development of Italy and under whose rule the authority of the state had fallen into decadence and decay." Fascist writers and speakers, with this phase of their movement in mind, often described Fascism as a "spiritual revolt." Secondly, Fascism was anti-communist. From 1919 to 1922, it waged a sort of guerrilla warfare against socialism in Italy; Fascisti roughly dispersed Socialist party meetings, raided Socialist printing offices and headquarters, and administered novel and ingenious forms of physical punishment to leading Communists. Further, it organized labor unions of its own, found work for the unemployed with Fascist capitalists, and thanks to its success in these directions, soon began to accept the affiliation of unions which deserted socialism. To prevent the landless peasants of southern Italy and Sicily from joining forces with the social revolution, the Fascisti took it on themselves in many localities to cut the Gordian knot of the agrarian problem by compelling landlords to subdivide and sell their estates, or by persuading friendly landowners to offer small plots for sale to peasants. So effective were these measures that communism in Italy was, if not annihilated, at least compelled to work underground, and even the more moderate political socialism was reduced to impotence. By 1921 Fascism, in the words of Mussolini himself, was no longer "liberation but tyranny; no longer the safeguard of the nation, but the upholding of private interests and of the most groveling and unenlightened classes existing in Italy."

As the organization became more powerful, it entered its political phase. Indeed, now that it embraced workingmen and peasants as well as bourgeois and militarists, it could no longer pursue a clear-cut policy in economic matters, nor could it survive permanently by merely talking about patriotism. Political action was a necessity as well as a logical consummation of the order's career. Gradually, the Fascisti gained control of many municipalities, using violence where votes would not avail. Then their leaders looked to Rome. Mussolini grew more insistent in his declarations that the existing parliamentary government, headed by a vacillating coalition cabinet, was unrepresentative and unworthy of Italy. Soon he had the temerity to demand for himself and his followers places in the cabinet. Meeting refusal, he became but more ambitious. In October, 1922, he compelled the Ministry to resign and installed a Fascist cabinet. See ITALY, under *History*; also MUSSOLINI.

The Fascisti preserved their organization as a sort of unofficial militia on which Mussolini could, if need be, rely; at the same time they

constituted themselves a political party for parliamentary and electioneering purposes. Though he had denounced the inefficiency and unrepresentative character of parliamentary government, Mussolini utilized Parliament to carry out his own policies, and after he had won a sweeping electoral victory, his administration became in form at least a responsible government, like its despised predecessors. One marked difference characterizing Fascist rule, however, was the fact that force was relied on as an expedient to be employed if democracy failed. "I declare," said Mussolini in 1923, "that my desire is to govern, if possible, with the consent of the majority, but in order to obtain, to foster, and to strengthen that consent, I will use all the force at my disposal." All else failing, "there is always force." This was the aspect of Fascism that appealed so strongly to ambitious leaders in Spain, Bavaria, Bulgaria, Mexico, and many another country: if votes fail, there is always violence.

In economic policy after 1922, the Fascists emphasized chiefly the reform of governmental finance. For labor, they enacted an eight-hour-day law and a collective-agreements law designed to promote collective bargaining between organized labor and organized capital. State monopolies, such as telephone service, matches, etc., were handed over to private companies, in accordance with the Fascist principle of maintaining private enterprise and combating state socialism. In religion, the Fascisti, in power, were partisans of reconciliation between Catholic and non-Catholic; they restored compulsory religious instruction; and they succeeded, in 1929, in establishing more cordial relations with the Vatican—all for the sake of that national unity which, to their way of thinking, should transcend all else.

In 1926 Mussolini sought to consolidate the economic gains of his system in the establishment of the Fascist, i. e., corporate, state. This was done through the act called "The Legal Discipline of Collective Labor Relations" which established syndicates, collective labor contracts, and labor tribunals, and prohibited lockouts and strikes. Fascist syndicalism, like other Fascist institutions, showed itself to be hierarchical and centralized. The Fascist state arrogated to itself the right to police and supervise all the activities of the syndicates. After two years, it was seen that Fascism was regarding itself not as a reactionary movement against communism, but as a continuous revolution. It evidently was coordinating Catholicism, nationalism, pragmatism, and syndicalism under the banner of imperial Rome. Its syndicalism had nothing to do with Marxian internationalism or class war. Like socialism, however, it was swallowing up the individual in a scheme of national production under the strictest of state control. The corporative idea was functioning through a bureaucracy responsible to Mussolini, and evidently the individual was being regarded as an outworn institution. However, unlike all proletarian utopias, Fascist Italy was essentially middle-class and the real gainers of the system were the industrialists. The workers, it is true, in exchange for their liberty, were getting a modicum of security; but, after all, the slaves under imperial Rome did not have less.

The logical conclusion to the political phase of Fascism came at the end of 1927 when uni-

versal suffrage was abolished. The electoral reform measure also included the following: the nomination of candidates for the Chamber of Deputies by economic guilds; the abolition of all other parties; the substitution of a single electoral constituency in place of territorial divisions; and the reduction of the size of the chamber. In effect, the right to vote was held only by those who belonged to one of the 13 syndicalist organizations and contributed dues. See ITALY.

**Bibliography.** The outstanding scholarly work on the Fascist state was published in 1928 by the Oxford University Press. It is *Making the Fascist State*, by Dr. Herbert W. Schneider of Columbia University and, besides being a dispassionate account of the birth of Fascism, is fully documented and contains a bibliography of 21 pages. The same year also saw the publication of Mussolini's autobiography.

**FATIGUE.** See PSYCHOLOGY, ABNORMAL.

**FAULHABER, MICHAEL VON** (1869- ). A Roman Catholic Cardinal of Munich, Germany, born at Heidenfeld. He studied at the Universities of Würzburg, Rome, and Oxford, was professor at the University of Strassburg, and became Bishop of Speyer (1910), Archbishop of Munich (1917), and Cardinal in 1921. He is the author of *Petrus Stirbt Nicht* (1903); *Die Vespersalmen* (1906); *Schule und Religion* (1907); *Priester und Volk* (1911); *Hirtenbriefe* (1912); *Charakterbilder aus der Biblischen Frauenwelt* (1920); *Die Freiheit der Kirche* (1913); *Waffen des Lichtes* (1918); *Das Schwert der Geister* (1918); *Trennung von Kirche und Staat* (1919); *Zeitfragen und Zeitaufgaben* (1920); and *Das Papsttum in Unserer Demokrat-schen Zeit* (1920).

**FAULKNER, JOHN ALFRED** (1867- ). An American church historian (see VOL. VIII). He was Stone lecturer at Princeton Theological Seminary in 1923. He published *Wesley as Sociologist, Theologian, Churchman* (1918), *Value of Study of Church History* (1920), *Modernism and the Christian Faith* (1921), and *Miraculous Birth of Our Lord* (1924).

**FAUST, CAMILLE.** See MAUCLAIR, CAMILLE.

**FAUST, EDWIN STANTON** (1870-1928). An American physician, pharmacologist, and biochemist, born at Baltimore, Md. After preliminary study at Johns Hopkins, he went to Munich to study chemistry and medicine. On his return, he was associated with the department of biochemistry at John Hopkins (M. D., 1907, *honoris causa*) and later held a similar position at the University of Michigan. He returned to Strassburg to study pharmacology under Schmiedeberg and in 1908 accepted the chair in that branch at the University of Würzburg. At the outbreak of the World War, he moved to Switzerland where he died. While his work embraced the entire range of pharmacology and biochemistry, he specialized in toxicology. In 1906 he published his only monograph, *Die tierische Gifte* and in 1913 he collaborated with Schmiedeberg in bringing out the seventh edition of the latter's *Grundriss der Pharmacologie*.

**FAY, ALBERT HILL** (1871- ). An American mining engineer, born in Appleton City, Mo. He graduated from the Missouri School of Mines in 1902 and took post-graduate courses at Columbia. He was in charge of mining operations in Mexico, Alaska, and Tennessee until

1908, when he joined the editorial staff of the *Engineering and Mining Journal*. He served with the Bureau of Mines from 1911 to 1920, and from the latter date was valuation engineer with the Internal Revenue Bureau. From 1921 to 1923 he was also head of the natural resources division of that bureau. He was consulting mining engineer, 1923-25, and assistant editor of the *Engineering Mining Journal-Press* (New York), from 1925 to 1927 when he again returned to private practice. He wrote *Coal Mine Fatalities in the United States, 1870 to 1916* (1916); *Glossary of the Mining and Mineral Industry* (1920). He also wrote numerous technical bulletins.

**FAY, HENRY** (1868- ). An American chemist, born in Williamsport, Pa. He graduated from Lafayette College in 1889 and took post-graduate courses at Johns Hopkins. He was instructor at that university from 1893 to 1895, and from the latter date to 1920 was a member of the faculty of the Massachusetts Institute of Technology, becoming professor of analytical chemistry and metallography in 1920. He retired in 1926. He was also consulting chemist for several large corporations and was lecturer at the United States Military Academy and the United States Naval Academy. He wrote *Microscopic Examination of Steel*, 1917, and contributed articles on chemistry and metallography to various journals.

**FAY, SIDNEY BRADSHAW** (1876- ). An American professor of history. He was born at Washington, D. C., and received the degrees of A.B. and Ph.D. at Harvard. He also studied at the Universities of Paris and Berlin, and held a teaching fellowship at Harvard. He was professor of history at Dartmouth (1902-14) and since 1914 has held the chair of European history at Smith College. He wrote *The Origins of the World War* (1928), and edited the *Records of the Town of Hanover, N. H., 1761-1818* (1905); *A Syllabus of European History* (with Herbert D. Foster; 4th ed., 1912); *Smith College Studies in History* (1905- ), and *Fueter's World History* (1922).

**FAYANT, FRANK H.** (1876- ). An American publicist, born at Fort Plain, N. Y., and educated at Cornell University. He worked on various newspapers from 1895 to 1900, acting as war correspondent for the *New York Sun* in the West Indies from 1898 to 1900. In the latter year, he was London correspondent for the *New York Herald* and served other American magazines and journals until 1911, when he became a member of the editorial staff of the banking and currency reform campaign. He was assistant to the chairman of the National Conference Committee of the Railways, 1916-17, and assistant to the chairman of the Association of Railway Executives, 1917-20. He was vice president of Thomas F. Logan, Inc., 1919-26, and of Lord & Thomas & Logan after 1926. He is author of *Fools and Their Money* (1907), *Government and the Railroads* (1919), *To Increase Railroad Efficiency* (1922), and other works.

**FAYOLLE, fə'yöl, MARIE ÉMILE** (1852-1928). A French soldier who was born at Le Puy, Haute Loire, and educated at the École Polytechnique, where he specialized in artillery, which he later taught at the Superior School of War. By 1910 he had become a brigadier general and by 1914 had retired, but he was recalled to service at the outbreak of the World

War and given command of the artillery brigade of Vincennes and then the 70th Division of Infantry. In the following year, he led the 33d Army Corps and then the 6th Army, distinguishing himself at the Battle of Somme. In November, 1917, he became commander of the French forces in Italy, and in March, 1918, was given command of a group of armies including two American divisions, between the Marne and the Aisne. He directed the second Battle of the Marne (July 18) which precipitated Germany's defeat. After the armistice, he commanded the Army of Occupation at Pfalz, and in 1919 became a member of the Superior War Council, and chairman of the Allied commission to oversee the German disarmament. In 1920 he represented General Foch at the meeting of the American Legion, and in the following year was made a Marshal of France. In 1921 and 1922 he went on special missions to Canada and Italy. He wrote *Concentration des feux et concentration des moyens* (1913).

**FAZY, fã'zã', HENRI** (1842-1920). A Swiss Radical statesman and historian, born at Berne. He studied philosophy and law at Geneva; in 1860, he became a member of the cantonal parliament, and in 1897, a member for the remainder of his life of the cantonal executive. Like his great-uncle, James Fazy, he played a prominent part in Radical politics at Geneva. His proposal to separate the Church and State was not accepted by the Swiss until 1907. He was a member of the Swiss National Council (1896-99, 1902-20), archivist of Geneva and professor of Swiss history at the University of Geneva (1896-99, 1902-20). His *Life of James Fazy* appeared in 1890, works on the Swiss Government shortly afterward, *Histoire de Genève à l'Époque de l'Escalade, 1580-1601* (1902), and *Genève et Charles Emmanuel* (1909).

**FECHTER, fã'kã'tãr, PAUL** (1880- ). A German editor and art critic. He has been literary and dramatic editor of the *Dresdener Neueste Nachrichten*, the *Vossische Zeitung*, and other prominent papers, and is the author of *Der Expressionismus* (1914), *Frank Wedekind* (1920), *Das Graphische Werkman Pechsteins* (1920), *Die Tragödie der Architektur* (1921), *Gerhart Hauptmann* (1922), and the novels *Die Kletterslange* (1926) and *Der Ruck im Fahrstuhl* (1927).

**FEDERAL AID ROAD ACT.** See **ROADS AND PAVEMENTS.**

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** Founded in 1908 by the official action of 30 Protestant denominations in the United States to represent them and act for them in matters of common interest. No control is exercised over the churches; rather it is their own agency for coöperation and common expression, directed and controlled by their representatives. Four hundred members elected by the denominational assemblies compose the quadrennial Council, which met in December, 1916, 1920, 1924, and 1928. The executive committee meets annually; the administrative committee monthly.

The activities of the Council between are carried on through the various commissions. That on International Justice and Good Will, in accordance with its usual policy, conducted an educational campaign in 1925 to urge the entry of the United States in the permanent Court of International Justice, and to recommend the outlawry of war. The commission is also in-

terested in improving relations with the Orient. The Department of Research and Education publishes a weekly bulletin on social affairs, occasionally making special studies, as in 1927, a *Report on the Oil and Land Controversy between the United States and Mexico*, and *Social Aspects of Agricultural Credit*, and in 1928 reports on the bituminous coal situation, and the rural-urban milk dispute in Chicago. The purpose of the Commission on Evangelism is to unify the missionary work of the various denominations. Through the Commission on the Church and Social Service, which is especially interested in industrial relations, the churches are able to take a unified stand on social questions. A particular effort was made in 1926 to secure coöperation between national bodies and local church communities, and a new secretary was added to the Council staff to further such organization. The Commission on Church and Race Relations is mainly devoted to promoting friendship between the white and Negro races in the United States. A Church and Drama Association was formed in 1927, to encourage meritorious stage and screen productions. Other commissions are concerned with Christian education, relations with religious bodies in Europe, religious work in the Canal zone, Army and Navy chaplains, and relations with the Eastern churches.

The Council coöperates with such social organizations as the American Red Cross, the Child Welfare Movement, and the U. S. Bureau of Public Health. Representatives of certain church agencies serve on the Council administrative committee, including the Home Missions Council, the Council of Women for Home Missions, the Council of the Church Boards of Education, the American Bible Society, the Student Volunteer Movement for Foreign Missions, and the International Council of Religious Education.

A monthly, the *Federal Council Bulletin*, furnishes general religious news. The ninth survey, *The Handbook of the Churches*, was published in 1927, giving historical and statistical information concerning the Council, denominations, and various religious organizations. In 1928 Bishop Francis J. McConnell succeeded the Rev. S. Parkes Cadman as president of the Council. The national offices are at 105 East 22nd. Street, New York, and there are also offices in Washington, D. C., and in Chicago, Ill.

**FEDERAL HORTICULTURAL BOARD.** See **HORTICULTURE.**

**FEDERAL LAND BANKS.** See **AGRICULTURAL CREDIT; FINANCE AND BANKING.**

**FEDERAL POWER COMMISSION.** See **WATER POWER.**

**FEDERAL RESERVE BANKING SYSTEM.** See **FINANCE AND BANKING; AGRICULTURAL CREDIT; UNITED STATES, under History.**

**FEDERAL TERRITORY.** A territory of the Australian Commonwealth lying within the State of New South Wales. Area, 940 square miles; population in 1911, 1714; in 1928, estimated, 8385. The site for a Federal capital and a port was acquired from New South Wales in 1909 and work was begun in 1913 on the construction of the Commonwealth's capital city. An additional area of 28 miles at Jervis Bay was added for the purpose of establishing a naval college. Progress on the work was seriously retarded during the War, but in 1923

building operations were begun and in 1927 the Federal Government began to move to Canberra. Here Parliament was opened in May 9, 1927, by the Duke of York. See AUSTRALIA.

**FEDERAL TRADE COMMISSION.** See TRUSTS.

**FEDERAL WATER POWER ACT.** See WATER POWER.

**FEDERATION OF LABOR, AMERICAN.** SEE LABOR, AMERICAN FEDERATION OF.

**FEDERN, fä'dern, KARL** (1868- ). An Austrian critic, translator, and authority on Dante (see VOL. VIII). To the literature of the World War, he contributed *Die Politik der Dreiverbündeten* (1915). His later works included *Deutschland, Vergangenheit und Gegenwart* (1925). To his translations he added works of Mesnil, Croce, Cervantes, Balzac, Stendhal, and Melville's *Typee* (1927). His most recent works are *Mazarin* (1922), and *Richelieu* (1927). The latter appeared in English translation (1928).

**FEISAL, fī'zāl, (1885- )**. King of Iraq, third son of Hussein, former King of the Hedjaz, born at Taif, Turkey. He received a modern education at Mecca and Constantinople and on the restoration of his father to the emirate of Mecca in 1908, Feisal commanded the Arab contingent in the operations of the Turks against the Idrisi (1911-13). He was elected deputy for Jidda in the Turkish Parliament (1914), commanded the rebels in the Arab revolt against Turkey in 1916, and supported the Egyptian Expeditionary Force of the Allies. After the Armistice, he set up a temporary government in eastern Syria and represented the Arabian cause at the Paris Peace Conference (1919). In March of the following year, he was proclaimed King of Syria by the Syrian national government, but the plan was overturned by the entry of the French troops into Damascus. The British government recognized him as King of Iraq and head of the new state under its mandate of August, 1921. In 1923 Feisal was made a constitutional monarch by the constitutional assembly, and in 1927 he went to England to negotiate a new treaty, in which Iraq was recognized by Great Britain as an independent state. This treaty was ratified in 1928. See ARABIA and MESOPOTAMIA.

**FELAND, LOGAN** (1869- ). An American soldier, born in Hopkinsville, Ky. He graduated from the Massachusetts Institute of Technology in 1892, served in the Spanish-American War and in 1899 was appointed first lieutenant in the Marine Corps. He was promoted to be major in 1916, colonel in 1918, and brigadier general in 1920. He served in the Philippines, Panama, Cuba, and Santo Domingo. He was commander of the 5th Regiment of Marines in 1918 and the 2d Brigade of Marines in Santo Domingo in 1919-20. For distinguished service in France, he was three times awarded the Croix de Guerre with Palm, and was made an Officer of the Legion of Honor. He also received the Army D. S. M. and the Navy D. S. M. for distinguished service. He commanded the American forces on shore in Nicaragua from 1926 to 1929, when he was made commander of the Department of the Pacific.

**FELDEN, fēld'en, EMIL J.** (1874- ). A German clergyman and author, born at Montigny (near Metz), and educated at the Gymnasium and the University of Strassburg. He was made primate of St. Martini, Bremen, in 1907.

He became a member of the Bremen *Bürger-schaft* in 1920. He is the author of *Die Protestantische Kirche in Deutschland* (1902); *Kirchlicher Liberalismus und Radikalismus* (1908); *Königskinder* (1914); *Kind und Gottesglaube* (1915); *Grundriss eines Freien Religionsunterrichts* (1916); *Menschen von Morgen* (1918); *Im Kampf um Frieden* (1919); *Die Sünde des Vatikans* (1920); *Spiritismus und Andere Okkulten Systeme* (1920); *Reichhafte Menschen* (1920), *Die Sünde wider das Volk* (1921), the novels *Albert Reinkings Hohenflug* (1922), *Die Mäntel der Liebe* (1924), *Der Quellenhof* (1925), and a biography of Friedrich Ebert, entitled *Eines Menschen Weg* (1926). He became the editor of the periodical *Es Werde Licht* in 1920.

**FELLOWSHIPS.** See UNIVERSITIES AND COLLEGES.

**FELTON, LLOYD DERR** (1885- ). An American physician. He was graduated from Johns Hopkins University and became attached to the Laboratory of Bacteriology and Immunology there and later at Harvard, where he became assistant professor of hygiene and preventive medicine in 1922. In 1924, after researches pursued under the auspices of the Metropolitan Life Insurance Company, he announced the discovery of an anti-pneumonic serum which had already shown the ability to reduce greatly the mortality of that disease.

**FELTON, SAMUEL MORSE** (1853- ). An American railway official (see VOL. VIII). He was appointed director general of military railroads by the Secretary of War in 1917 and was chairman of the port and harbor facilities commission of the United States Shipping Board in 1918-19 and acting chairman of the board in 1919. He was president of the Western Railway Association and a member of several engineering and patriotic societies. He was awarded the Distinguished Service Medal for his war-time services and was awarded also the Cross of the Legion of Honor by the French government. Since 1925 he has been chairman of directors of the Chicago Great Western Railroad.

**FEMINISM.** See WOMAN SUFFRAGE; WOMEN IN INDUSTRY; PAINTING, under France; AND SCULPTURE, under United States.

**FENOLLOSA, MARY McNELL** ("SIDNEY McCALL") (?- ). An American author, born at Mobile, Ala., and educated at Irving Academy in that city. She is the author of entertaining stories, some of them dealing with Japan, where she lived for some years. Her works include *A Flight of Verses* (1899), *The Dragon Painter* (1906), *The Breath of the Gods* (1906, 1920), *Blossoms from a Japanese Garden* (1915), *Sunshine Beggars* (1918), *The Stirrup Latch* (1917), *Christopher Laird* (1919), and others. She edited her husband's *Epochs of Chinese and Japanese Art*.

**FERBER, EDNA** (1887- ) An American novelist and short-story writer, born at Kalamazoo, Mich. After studying at the Appleton (Wis.) High School, she became a reporter on the Appleton *Daily Crescent*, and was later employed on the Milwaukee *Journal* and Chicago *Tribune*. Miss Ferber's writings are characterized by understanding and alertness of thought. She has published *Dawn O'Hara* (1911), *Buttered Side Down* (1912), *Roast Beef Medium* (1913), *Personality Plus* (1914), *Emma McChesney & Co.* (1915), *Fanny Herself* (1917), *Cheerful by Request* (1918), *Half Portions*

(1919), *The Girls* (1921); the comedy, *Our Mrs. McChesney* in collaboration with George V. Hobart; *Gigolo* (1922); *So Big* (1924); *Show Boat* (1926), and *Mother Knows Best* (1927).

**FERDINAND I, KING OF BULGARIA** (1861- ). (See VOL. VIII.) After wavering for over a year, in October, 1915, Ferdinand entered the World War on the side of the Central Powers. In the crisis resulting from the entry of Serbian troops into Bulgaria in October, 1918, he abdicated in favor of his son, Boris, and retired to Coburg.

**FERDINAND, VICTOR ALBERT MAINRAD, KING OF RUMANIA** (1865-1927) (see VOL. VIII). Succeeding to the throne upon the death of his uncle, King Charles I, Oct. 11, 1914, he led his country into the World War on the side of the Allies, Aug. 26, 1916, and on Oct. 15, 1922, was crowned King of Greater Rumania established by the peace treaties. He died July 20, 1927, at Sinaia, of pneumonia aggravated by a malignant internal growth. The throne passed to his grandson, Prince Michael. See RUMANIA.

**FERGUSON, ELSIE** (1883- ). An American actress, born in New York. She made her first appearance at the Madison Square Theatre in *Liberty Belles*. She starred in *The Outcast*, *Margaret Schiller*, and *Shirley Kaye*. In 1917 she went into motion pictures in *Barbary Sheep* and later did excellent work in *Rose of the World*, *The Avalanche*, *The Witness for the Defense*, *Footlights*, and *Peter Ibbelton*. She returned to the speaking stage in 1920 in *Sacred and Profane Love* and appeared in *The Varying Shore* (1921). She again entered the moving-picture field in 1922-23; but in 1924 she played Kate Hardcastle in *She Stoops to Conquer*, in New York, and Camilla in *Carnival*.

**FERGUSON, FRANK WILLIAM** (1861-1926). An American architect, born at Portsmouth, N. H., and educated at Dartmouth College. As a member of the firm of Cram & Ferguson, he helped plan buildings at the United States Military Academy at West Point, Saint Thomas's Church in New York City, Princeton University, Richmond College, Williams College, and Rice Institute at Houston, Tex.

**FERGUSON, JOHN CALVIN** (1866- ). An American in the service of the Chinese government (see VOL. VIII). He was counselor in the Chinese Department of State in 1915-17 and became adviser to the President of the Republic of China in 1917. He was a delegate to the Disarmament Conference (1921). He has been editor of the *China Journal of Science and Art* since 1923.

**FERNALD, ROBERT HEYWOOD** (1871- ). An American engineer, born at Orono, Me. He studied at the Maine State College and at the Massachusetts Institute of Technology, Case School of Applied Science, and Columbia University. He was professor of mechanical engineering at Washington University, 1902-07, and at the Case School, 1907-12, and from 1912 to 1921 was Whitney professor of dynamical engineering at the University of Pennsylvania. After the latter date, he was director of the Department of Mechanical Engineering at that university. He was a member of many engineering societies and was the author of many reports and bulletins relating to the conservation of the fuel resources of the United States.

**FERNOW, BERNHARD EDUARD** (1851-1923). An American forester and educator (See VOL. VIII). From 1907 to 1919, he was dean of the

faculty of forestry at the University of Toronto and in the latter year he was retired as professor emeritus.

**FERRAN Y CRUA, fè'ràn e crò'o'à, JAIME** (1852-1919). A Spanish bacteriologist and sanitarian. As early as 1885, he wrote on immunization against cholera. In 1893 his work on this subject was translated into French with the title *Inoculation préventive contre le Cholera*. In 1921 Fernandez, a Spaniard, published a volume, *Woe to Great Inventors*, seeking to show that Ferran had anticipated by 30 years the methods of immunization developed by Koch and practiced successfully in the World War. Ferran was deeply interested in tuberculosis and the possibility of immunization against it.

**FERRI, fè'r'rè, ENRICO** (1856- ). An Italian criminologist (see VOL. VIII). His later works include *Il Diritto Staccionato* (1916); *L'Azione di Risarcimento dei Danni dell'Imputato Assolto contro il Denunziante* (1916); *Enrico Pessina ed il Pensiero Italiano sulla Giustizia Penale* (1917); the report of the *Commissione Reale per la Riforma della Leggi Penali* (Fr. Eng. Ger. trans., 1921); *Mussolini, uomo di stato* (1927), and *Il fascismo in Italia e l'opera di Benito Mussolini* (1927). With others, he edited *La Scuola positiva*, a monthly law review (1921- ). His *Criminal Sociology* appeared in a new English translation in 1917.

**FERRIS, DAVID LINCOLN** (1864- ). A Protestant Episcopal bishop, born at Peekskill, N. Y., and educated at the Peekskill Military Academy, the Cayuga Lake Military Academy, Hobart College (Geneva, N. Y.), and the Berkeley Divinity School (then at Middletown, Conn.). He was ordained priest in 1894, having become deacon in the year preceding. He held several pastorates from 1893 to 1920, becoming in the latter year suffragan bishop of the diocese of Western New York and in 1924 bishop coadjutor. He served on various religious boards and committees and was a trustee of Hobart College. In 1929 he became bishop on the death of Bishop Brent.

**FERRIS, WOODBRIDGE NATHAN** (1853-1928). An American educator and public official (see VOL. VIII). He was elected governor of Michigan, 1913-14 and 1915-16, and as a Democratic United States Senator for the term 1923-29. He was put forward as a Presidential candidate in the preferential primaries in his State in 1924, and was defeated by Henry Ford by a narrow margin. He received the degree of LL.D. from Olivet College, the University of Michigan, and the University of Notre Dame.

**FERTILIZERS.** The so-called natural manures, such as animal excreta, animal and vegetable refuse of the farm, peat, and the like, which were formerly the main reliance for fertilizing purposes, are so inadequate to the needs of modern intensive agriculture that they are being replaced to an increasing extent by the more concentrated and active commercial fertilizers. The use of such fertilizers has therefore grown to very large proportions and become almost universal. It is estimated that 7,600,000 tons of commercial fertilizers costing the farmer \$249,660,000 was used in the United States in 1928, and this country is far behind European countries in the per-acre consumption of fertilizers. During and immediately following the World War, the price of commercial fertilizers was prohibitively high, with the result that their use was seriously curtailed, to the

detriment of the manufacturer and the farmer. Prices are now stable at or very near pre-war levels, making allowance for increased cost of labor and freight. At the same time, the quality (plant food content) has steadily improved.

The rapid development in production of synthetic nitrogen compounds and other more concentrated forms of fertilizing materials has greatly influenced fertilizer manufacture and use. The world's need for inorganic nitrogen is now being supplied to an increasing extent by fixation of the nitrogen of the air, and, as a result of this and other advances in fertilizer manufacture, highly concentrated fertilizers, such as ammonium nitrate, ammonium phosphate, ammonium chloride, urea, and various others, are appearing on the market in considerable quantity. The use of such concentrated materials and of higher grade mixed fertilizers results in a great saving in cost of transportation and handling.

A large proportion of the fertilizer nitrogen used is derived from the Chilean nitrate deposits, and this will no doubt continue to be an important source of supply for many years to come, since the processes of working these deposits and preparing the product for the market have been so improved that the cost of production has been reduced and the working of the poorer beds made profitable. There also has been a reduction in price to the consumer to meet the growing competition of the synthetic product. The production of sulphate of ammonia, both as a by-product and as a product of the synthetic process, is increasing and is one of the chief sources of nitrogen fertilizer. Organic sources of nitrogen, such as cottonseed meal, slaughterhouse by-products, and the like, are, however, more profitably utilized for other purposes, and hence their use as fertilizer is declining. The plant begun in 1916 at Muscle Shoals, Ala., with an appropriation by Congress of \$20,000,000 and to have a capacity of 40,000 tons of fixed nitrogen per year, was expected to be an important factor in supplying nitrogen for fertilizers. It has, however, never been completed, and its future disposition remains undetermined. A recent Act of Congress, providing for completion and Government ownership and operation of the plant, failed to receive approval by the President. Meanwhile, progress is being made in production of fixed nitrogen under private auspices and initiative. The Fixed Nitrogen Laboratory of the United States Department of Agriculture has found a catalyst and made other discoveries which increase the efficiency of the fixation process, and it is believed will reduce the cost of fixation. In general, it appears that notable progress is being made in meeting the world's need for fertilizer nitrogen at reasonable cost.

The known sources of supply of phosphates suitable for fertilizer purposes are abundant and are constantly being added to by discovery and exploitation of new deposits. The known and natural deposits of phosphates in the United States alone have been estimated to be capable of yielding over 10,500,000,000 tons. The materials and methods for converting these phosphates into superphosphate and other forms suitable for fertilizer purposes also are amply provided for. Superphosphate, the form in which phosphoric acid is most commonly used as a fertilizer, prepared by treating the raw phosphates with sulphuric acid, requires a

high-grade rock phosphate and results in great wastes of the lower grades. The Bureau of Soils of the U. S. Department of Agriculture has developed a process which utilizes these lower-grade phosphates by smelting the phosphate with silica and carbon and condensing and collecting the volatilized phosphoric acid, which may be used in the preparation of highly concentrated fertilizer compounds.

Potash, the third essential constituent of fertilizers, is still largely derived from the natural deposits of potash salts in Germany and France, despite widespread effort to develop other sources. The necessities of the War led to strenuous efforts to develop a potash industry in the United States, utilizing for this purpose especially certain Western dry lake deposits, kelp, alunite, and dusts of cement works and blast furnaces, but the industry did not grow to any great proportions and declined when the supply from German and French sources again became available. Efforts in this direction, however, are being renewed, and hope of developing a domestic potash industry has been encouraged especially by results of studies by the United States Geological Survey indicating the occurrence of extensive and commercially workable deposits of potash in the Permian salt beds of western Texas and eastern New Mexico similar to those of Stassfurt and Alsace. Progress also has been made in the recovery of potash from various potash minerals and trade wastes and from alkaline lake beds. On the whole, the outlook for an adequate supply of fertilizer potash at a reasonable price is good.

The growing relative scarcity of manure has led to efforts to find an efficient substitute for it. The Rothamsted Experimental Station has reported a fair degree of success with an artificial manure consisting of a fermented mixture of straw, chalk, and ammonium sulphate, and products prepared by similar processes have been tested with encouraging results by other agencies. Attention also has been turned anew to the possibility of greater use of green manures, peat, and city refuse, to better methods of preserving manure, and to sterilization as a means of prolonging the efficient use of manure in greenhouse culture and market gardening, but perhaps the most notable development in this connection has been the demonstration of the large extent to which commercial fertilizers alone or in connection with green manures or other organic substances may efficiently replace manure.

**FESS, SIMON D.** (1861- ). A United States Senator, born in Allen County, Ohio, who was graduated from Ohio Northern University, at Ada. He was professor of American history there (1889-96), head of the College of Law (1896-1900), and vice president of the University (1900-02). The next five years were passed as a graduate student and lecturer at the University of Chicago. From 1907 to 1917, he was president of Antioch College at Yellow Springs, Ohio. He was a delegate to the Ohio Constitutional Convention of 1912, a member of the 63d Congress (1913-15) from the Sixth Ohio District and of the 64th-67th Congresses (1915-23) from the Seventh District, and was elected to the United States Senate for the terms 1923-29 and 1929-35. In the closing session of the 70th Congress, he introduced bills for reapportionment and to permit the merging of railroad corporations. He is the author of *Outline of United States History* (1897); *American Political Theory* (1907); *Civics in Ohio* (1910); *Problems of Neutrality* (1917).

**FEUCHTWANGER, LION** (1884- ). A German writer and dramatist, born in München. He wrote the plays *Warren Hastings* (1916); *Jud Süß* (1917); *Der holländische Kaufmann* (1921); *Two Anglo-Saxon Plays* (1928), and the novels *Die Hassliche Herzogin* (1923); and *Power*. He adapted for the modern stage *Basantasena* (1915); *Der Friede* from Aristophanes (1916); and, with Bertolt Brecht, *Edvard II* from Marlowe (1924).

**FÉVRIER, HENRI** (1875- ). A French dramatic composer, born in Paris. He received his musical education at the Conservatoire under Pugno, Leroux, Fauré and Massenet. His reputation rests on the success of a single work, *Monna Vanna* (Paris, 1909; Boston, 1913). In 1919 he visited the United States for the purpose of witnessing the world première of his *Gismonda* by the Chicago Opera Company. Besides these operas, he wrote *Le Roi Aveugle* (Paris, 1906) *La damnation de Blanche fleur* (Monte Carlo, 1920), *L'île désenchantée* (Paris, 1925), and the operettas *Agnès, dame galante* (1912), *La Princesse et le porcher* (1912), and *Carmosine* (1914), all produced in Paris.

**FEWKES, J (ESSE) WALTER** (1850- ). An American anthropologist (see VOL. VIII). He had contributed largely to anthropological and other magazines and was chief of the Bureau of American Ethnology, 1918-28.

**FICKE, ARTHUR DAVISON** (1883- ). An American author, born at Davenport, Iowa, and educated at Harvard and the College of Law of the University of Iowa. He taught English at the latter institution and was admitted to the bar in 1908. Among his recent works are

*Sonnets of a Portrait Painter* (1914), *The Man on the Hilltop* (1915), *Chats on Japanese Prints* (1915), *An April Elegy* (1917), *Spectra*, with Witter Bynner (1917), *Out of Silence* (1924), and *Selected Poems* (1926).

**FICTION.** See LITERATURE, ENGLISH AND AMERICAN; also BULGARIAN LITERATURE; CZECHOSLOVAK LITERATURE; FRENCH LITERATURE; GERMAN LITERATURE; HUNGARIAN LITERATURE; ITALIAN LITERATURE; POLISH LITERATURE; RUMANIAN LITERATURE; RUSSIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE; JUGO-SLAV LITERATURE.

**FIELD, HAMILTON EASTER** (1873-1922). An American artist, born at Brooklyn, N. Y. He studied at the Polytechnic Institute, at Columbia and Harvard universities, and under Raphael Collin and Fautin-Latour at the École des Beaux Arts in Paris. Shortly before his death, he inaugurated the Salons of America, of which he was the first president. He was editor of *Arts and Decoration*, editor and owner of *The Arts*, the *Touchstone Magazine*, and *The American Art Student*. He was director of the Thurnscoe School of Modern Art, Ogunquit, Me., and the Ardsley School of Modern Art, Brooklyn.

**FIELD, HERBERT HAVILAND** (1868-1921). An American zoologist, born in Brooklyn, N. Y., and educated at Harvard. His published papers at Harvard were mostly on the embryology of the frog, but from 1895 he lived in Zurich (Switzerland), where he organized and administered the *Concilium Bibliographicum*, an international catalogue of scientific literature, which aims of give in card-catalogue form the title of every paper on zoology published throughout the world.

**FIELD ARTILLERY.** See ARTILLERY.

**FIELDS, JOHN CHARLES** (1863- ). A Canadian mathematician (see VOL. VIII). He became a member of the University of Toronto Senate and research professor in mathematics in 1914 and was president of the Royal Canadian Institute from 1919 to 1925. He presided over the International Mathematical Congress which met in Toronto in 1924.

**FIJI ISLANDS.** See PACIFIC OCEAN ISLANDS.

**FINANCE AND BANKING.** The subject of public finance, customarily restricted to include discussion of revenue and expenditure, also may be taken to cover the discussion of public debt; and in recent years has frequently been employed to include within its scope discussion of banking and credit as well. The term finance is here used in the latter broad sense. Finance in its public aspect includes two distinct fields of thought; the first covering the theory of taxation and of public revenue in general, as well as the theory and practice of budgetary management on the part of modern nations, the latter including survey of actual results attained as to revenue and expenditure by principal nations. In banking, discussion is usually divided into two more or less distinct fields, the first dealing with the theory and organization of banking institutions, the second with actual banking systems and results of operation.

Prior to the World War, steady and consistent effort was made by nations to maintain a distinct line of separation between public finance and banking, the principal connection between the two types of activity being afforded by the

operation of central banks in the different countries. During the War, public revenues were in no small degree obtained through banking methods, with corresponding effects upon prices, while governments practically took possession of banking systems with a view to controlling supplies of credit, issues of currency and rates of interest. The result has been that, since the close of the War, a very intimate connection has continued to exist between public finance and banking in actual practice, while levels of prices and other aspects of the general economic situation have felt the effects of financial and banking policies compositely, rather than independently. Therefore, much discussion of public finance and of banking is today carried on jointly, while the bulk of the consideration of public finance implies specified conditions as to banking; and, conversely, statements of theory and practice in banking are based upon specified assumptions made as to financial conditions.

**Relation of Finance and Banking.** Banking is the phase of economic organization, or the economic institution, by means of which the credit function is exercised and through which actual wealth is made available as a means of exchange. Public finance is the science or method whereby governments obtain the resources they need and apply them to designated objects. Evidently, where governments become large operators of industry, large owners of wealth, or large consumers, they come to occupy a very important relationship to banking, inasmuch as they require extensive banking services and must rely largely on banks for the collection and payment of funds as well as for the transfer of wealth from individuals to the government and vice versa, and for the advancement of private resources for government use pending the time when the government has collected from taxpayers wealth in sufficient quantity to meet its requirements. Moreover, the increasing use of paper currency and the hazards involved in leaving its issue unrestrictedly in the hands of the banks have led to the establishment of an intimate relationship between the government and the banking mechanism with respect to the control of the circulating medium. At the same time, the creation and retirement of such medium, coupled with the variations in the volume of bank credit in other forms, have exerted a direct influence on prices, and hence on the volume of taxation required to furnish means for the government's needs as respects the purchase of commodities and services.

**Expenditure of Principal Countries.** It is worth while to take careful account also of the

expenditure of the principal Continental countries, not only because of the inferences that may be drawn from such comparisons as to the causes of growth of public outlay in the different countries but also because of the light that is thereby thrown upon the burdens to which the public of the several nations have been subjected. The accompanying table furnishes the data necessary for such a comparison during the war and the post-war period.

**Trend of Finance 1914-29.** The war and post-war period included in the years 1914-29 is too recent to permit positive judgment with respect to consequent effects upon methods or currents in public finance. It will require a much longer lapse of time to reach definite conclusions as to the probable outcome of the factors which had been set at work as a result of the War; yet, there are outstanding facts which are deserving of special notice from a descriptive standpoint and which supply the basis for inferences with regard to the probable trend to be followed in the future. Generally speaking, the outstanding feature of the period is found in the enormous growth of public expenditure which has carried the outlays of substantially all modern governments, whether belligerent or neutral, up to figures that before the War would have been considered purely imaginative. This enormous growth of public expenditures was, in the belligerent countries, the natural result of warfare and its costs, but in the neutral countries was only partly brought about as the indirect result of these factors. Many of the smaller countries, especially those bordering on the scene of action, found it necessary to mobilize their armies and to keep large bodies of men ready for defense should such a step become necessary. Yet this alone was not a sufficient influence to bring about the tremendous growth of outlay. Added to it was the fact that the enormous inflation of credit and currency in the belligerent countries was reflected in the neutral states, while the world demand for commodities itself tended to raise prices everywhere; the outcome being a great advance in the price level of which the net result was to necessitate corresponding increases in the amounts of revenue raised for the public service as expressed in terms of money. This state of things, it should be remembered, came into existence at a time when there was already a general drift toward higher levels of expense, which had already made itself apparent not only with respect to absolute amounts but also in proportion to population. The movement, viewed in the aggregate, may be illustrated by the experience of the United States, which was at first a neutral and later a belligerent, its

\* Fiscal year. <sup>b</sup> 1913.

Federal expenditure, both absolutely and per capita, moving as indicated below in the table:

AMERICAN FEDERAL EXPENDITURE (ordinary)		
Year	Total (000,000 omitted)	Per Capita
1900	\$520.8	\$6.84
1910	893.6	7.52
1915	760.5	7.66
1920	6,482.1	60.91
1923	3,697.5	33.10
1924	2,946.4	30.83
1925	2,464.1	30.59
1926	5,030.3	80.61
1927	2,897.1	29.45
1928	2,897.1	50.36

This showing is clearly paralleled in the fact that Great Britain, whose conditions are perhaps closer to those of the United States than are those of any other country, has seen her national expenditure rise from £2.31 per capita in 1890 to £3.52 in 1900, followed by a very moderate decline to £3.50 in 1910 and an increase to £22.7 in 1921 then followed by a post-war decline due to economies which, however, carried the figure only to about £19.5 in 1928.

penditures during and after the War greatly exaggerated this tendency toward the growth of military outlay, while at the same time it naturally enlarged the proportion of expenditure going to public debt, due to the fact that the War was necessarily (as will be seen later) so extensively financed upon a borrowing basis. While some progress was made after the close of the War, diminishing the amounts directly spent for army and navy, and while the treaties which grew out of the Washington Naval Conference of 1924 had a palliating effect, rebirth of international suspicion occurred after 1925, and very large naval programmes were put forward both in Europe and in the United States. It was still true in 1928, if the public debt be primarily regarded as a legacy of post-war outlays, that the total amount payable for military and naval reasons far exceeded any other category and was probably on the increase. The accompanying table reviews the development of American Federal government outlays at intervals from 1870 down to the situation during the fiscal year ending in 1928. Whether expendi-

## UNITED STATES EXPENDITURE IN MILLIONS OF DOLLARS

\* Exclusive of postal deficiencies.

**Classification of Expenditure.** Almost as important as the gross amount of expenditure, is its classification as between different purposes. Before the War, there was everywhere a substantial growth toward an undue outlay for military and naval expenditure, which gave rise to much of the demand for a means of obtaining international agreements for the maintenance of peace. The drift of public ex-

penditure has proceeded more rapidly than the growth of wealth in recent decades is another point as to which statistics are very much less positive. It would seem in the main that prior to the War, wealth was increasing slightly faster than expenditures. War experience makes the question far more debatable.

**Comparative Revenues.** While there is much advantage to be derived from careful com-

parison of the revenues of different countries, the same difficulty inheres in any such comparison that has been noted in connection with expenditures. Nevertheless, it is possible to afford a rough general comparison of outlays particularly for recent years, war necessities and negotiations having compelled a closer basis of analysis for the purpose of reducing national expenditures and receipts to somewhat the same footing in one country as in others. The figures in the accompanying table furnish comparative data designed to contrast revenue and expenditure conditions in the several countries.

**Local Versus National Finance.** In the United States, particularly, great interest has always attached to the distribution of taxation and expenditure between the Federal and local governments. This is due to the fact that, under our peculiar system of State and local government, there has been considerable jealousy between the different grades of administration, as well as more or less conflict in their taxing policy. The War and the developments after it materially affected this relative situation while they widely altered the relationship existing between the amount of Federal and local expenditure and income. In 1904 the U. S. Census Bureau, in a first report on the subject, showed that local expenditures were 61.8 per cent of all governmental outlays in the United States. Similar inquiries in Great Britain showed local expenditures for 1910 as 55 per cent. While the increase of local expenditure, not only here but in England and in other countries, has gone on rapidly, measured in absolute figures, being augmented by special causes which are perhaps not permanent in their nature, the relative proportion of local outlay has been reduced, due to the fact that national or Federal expenditures have been so vastly enlarged. For 1927-28 Great Britain's local expenditures were less than 17 per cent of her national total, while those of the States and larger cities in the United States, in 1928, were 46 per cent of the total.

**Local Revenues.** Local revenues in the United States have been studied by the Census Bureau, which furnishes the following figures:

# REVENUES FOR CITIES (146) OF OVER 30,000 POPULATION

Year	NET REVENUE RECEIPTS	
	Amount (000 omitted)	Per capita
1927	\$2,568,749	\$69.77
1926	2,391,607	66.14
1924	2,038,512	58.41
1922	1,801,302	53.57
1919	1,103,666	35.26
1917	968,445	31.97
1915	865,271	30.00
1905	498,837	22.79

**Sources of Public Revenue.** The theoretical classification of public revenues employed by most writers on public finance, omitting minor or casual sources of income such as fines and gifts, includes: (1) Prices.—By this term is meant the revenue arising from the sale of public property such as land and its products, usually a small proportion of the income of well developed states. (2) Charges.—By this term is meant the sums exacted for the particular services, largely industrial, rendered by the state, including post office, telegraph, telephone, railroad, gas and electric light, and sale of manufactured products. (3) Fees.—By this term is meant the sums exacted for services rendered by public authorities in the course of administration of business. Included are court fees, licenses, and the like. They are charged upon the theory that they represent the return for a special service which is not enjoyed by the entire body of the community. Special assessments are grouped under the head of fees by most writers. (4) Taxes.—By taxes are meant sums levied upon the citizen as a contribution to the general welfare or for the support for the government in the performance of functions which are so broadly applicable to all citizens that they cannot be apportioned or assigned, while their cost is so great that they must be paid for on a common basis regardless, in some measure, of specific advantage to the individual. The characteristic of the period 1914-28 has been the great growth of the latter revenue source.

## REVENUES FOR STATES (48)

### COMPARISON OF TOTAL AND PER CAPITA REVENUES

Year	All revenues		From taxes		All other revenues	
	Total (000 omitted)	Per capita	Total (000 omitted)	Per capita	Total (000 omitted)	Per capita
1927	\$1,758,381	\$14.99	\$1,355,127	\$11.55	\$403,254	\$3.44
1926	1,655,495	14.29	1,264,285	10.91	391,210	3.37

1928	3,863.9	568.1	617.6	2,174.5

**Reliance on Direct Taxation.** Pre-war finance in many countries relied largely on indirect taxation. In the United States, the Federal government was collecting in normal years the great bulk of its income from customs duties and internal revenue charges. During the early war years, a small income from direct taxation also was obtained. Great Britain had long had the income tax in effect and it was producing substantially at the opening of the War. Nevertheless, Great Britain also relied largely on indirect taxes and the same was true of most countries. The war necessities changed all this and hostilities greatly increased the total burden of taxation and made it absolutely necessary, in order to get the required funds, to rely largely on the proceeds of direct levies. Not only, therefore, was the total burden of taxation very greatly added to, but also the amount paid to governments as direct deductions from income not dependent upon purchase or the performance of specified acts was greatly enlarged. The effect of this change in method of taxation was undoubtedly to make the burden of the tax loads very much more obvious, and to make it seem more serious than would have been true had it been collected entirely through indirect sources. Efforts to reduce budgets after the close of the War did not prove very successful and it was found in almost all cases that indirect taxation had been carried practically to the extreme of its productivity, while the income and excess profits taxes in those countries which depended upon these sources of income predominantly, had been raised to a point which was interfering with the growth of wealth. This latter consideration seemed to be of peculiar force in Great Britain and in the United States where during the early post-war years there was an obvious decline in the amount of saving due to the fact that taxpayers of large income really engaged in business found it a matter of relative indifference whether to increase their business expenses to a point which consumed what might otherwise have been additional net income or to pay the latter in large part of the Government. With rates on incomes running as high as 60 to 70 per cent, the inducement to saving beyond a

specified limit was not strong. Hence, most post-war fiscal policies which aimed at budgetary economy sought to bring about such economy by a reduction in the burden of direct taxation. One outgrowth of this movement was the adoption in November, 1921, of the Income Tax Revision Law in the United States which eliminated the excess-profits tax, while in Great Britain the budget estimates for the year beginning Apr. 1, 1922, abandoned the idea of further debt reduction during the year in question, excess-profits taxes having already been repealed in 1921.

The post-war taxation on the Continent of Europe naturally followed a somewhat different course because of the fact that during the War so great a reluctance to further tax increases had been made manifest. The necessities of such countries as France, Germany, and Italy after the War naturally dictated the imposition of new, rather than the withdrawal of old, taxes because of the necessity of providing means which would carry the very heavy interest charges resulting from the borrowing policies of the War.

Post-war finance, both in the United States and in Europe, has had three principal objects—the reduction or abolition of the enormous taxation of the war period, the funding and consolidation of the debts created during the War, and the reduction of government expenditures. Coincident with these it was necessary to find a means of insuring the restoration of banking systems to a sound condition, as well as to provide for the placing of foreign exchange rates upon a more stable basis, and at the same time to take measures so that the international flow of trade and of investments should be correspondingly facilitated. One principal obstacle to success in these undertakings has been the tangle of indebtedness existing between the various countries. Such indebtedness represented the aid extended by one country to another during the War, but it was early perceived that in the last analysis there was but one great creditor, the United States, and one great debtor, Germany. It was recognized accordingly that the key to the restoration of a sound system of post-war finance was probably to be found in the introduction of a satisfactory system of reparation payments which should enable the Allied belligerents to collect from Germany enough to enable them to offset the bulk of the losses to which they had been subjected and at the same time to settle with their external creditors. The Treaty of Versailles had made no definite disposition of these questions, leaving final settlement to the so-called Reparation Commission, which in March, 1920, announced a scheme of reparation payments whereby Germany's total obligation was fixed at 135,000,000,000 marks (pre-war gold value). Elaborate details concerning the payment of this sum were provided and the bulk of the cash proceeds was assigned to France, Belgium, and Italy. The Germans, however, failed to pay more than approximately enough to cover the cost of holding the occupied German territory which had been taken by the Allies as security for the liquidation of their claims.

Accordingly, France and, in a much lesser degree, some of the other countries that relied on the collection of German indemnities as a means of meeting their budget requirements were unable to obtain the funds necessary to settle the budget obligations they incurred in the belief

that they would be able to transfer the cost to the Germans. Hence, their budgets failed to balance and such reductions in taxation as occurred simply cut away the fundamental basis upon which a restoration of soundness would necessarily rest.

Great Britain, which did not rely on any considerable receipts from Germany, was able gradually to restore her exporting power, despite some serious industrial obstacles such as the coal strike of 1921. Accordingly, in 1924 new reparations conferences were begun and the so-called "Dawes plan" was the result. Payments under the Dawes plan were to increase to a standard payment for 1929 amounting to \$5,931,000,000 and the capitalized value of the actual payments was estimated at 50,000,000,000 marks. In case Germany should prove unable to transfer the funds owing to lack of exchange, they were to be accumulated in German banks.

This plan was carried out until 1929, when new negotiations were begun. The pressure for reduction of the terrible tax load was severe in all countries and has resulted in a good many revisions and some alleviation, but the only countries in which material reduction was secured have been Great Britain and the United States. In the latter, demand for reduction became formidable soon after the War. The Republican Party, elected in the autumn of 1920, largely on a platform of tax reform, adopted in October, 1921, a so-called tax-revision measure which, however, cut the burden of taxation but slightly, although technically repealing the excess-profits tax. Later revisions culminating in the Income Tax Law of 1928 still further reduced the burden, but it everywhere remained far in excess of previous taxes. Great Britain likewise did away with the excess-profits tax and similar action was taken in other countries. Nevertheless, in all the problems of rebalancing, the budget was seen to rest more and more upon the restoration of sound banking conditions.

Progress toward sound budgetary conditions was greatest in the United States and in England during 1920 and 1921. In the United States, ordinary receipts up to November 12, for the fiscal year beginning July 1, 1921, exceeded ordinary disbursements by about \$155,000,000. The British budgetary recovery was slower, showing deficits in 1920-21, but continuing steady improvement up to 1928 when expenditures had been reduced to £838,000,000 with revenues of £842,000,000.

In most of the Continental countries, the budget situation for some time after the War showed no real improvement; but recovery gradually set in and has now become fairly well confirmed in the major states. Budgetary figures for Italy for the fiscal year 1928-29 showed revenue of 17,643,000,000 lire against outlay of 17,372,000,000 lire. The French government contemplated revenues for 1928 amounting to 42,160,682,000, contrasted with outlays of 41,527,952,000 francs. Of the ordinary receipts, 38,500,000,000 francs were expected from indirect taxes and monopolies. At the opening of 1927, the total public debt of France was 300,000,000,000 francs, internal, and 220,000,000,000 francs, external. This figure does not include loans floated by the cities and industries in the devastated regions, although the Government is responsible for their interest and repayment. In the case of Germany, government expenditures for 1928 were estimated at 10,610,000,000 Reichs-

marks. The funded debt at the opening of 1928 was 8,000,000,000 Reichsmarks.

There has been a prevailing belief for a long time past that the principal element in the existing fiscal difficulties of many countries is to be found in their great outlay for war. This statement is true in broad terms, but requires to be qualified and limited in its application. In some countries, such as the United States, the outlay for war, while a very large part of the total outlay, is in large measure an expense which serves to carry the cost of past wars in the form of interest on public debt. While naval and military expenditure is large in such countries, it is a relatively moderate part of the entire budget. In other countries, as in France, the current cost of military support still constitutes a very important fraction of the budgetary outgo. It has, therefore, been thought worth while to compile statements designed to show the comparative situation of the budget in several of the principal countries, with a view to ascertaining approximately how each stands in this matter of expenditure for national defense, especially as compared with pre-war years.

Compared with 1913, the last pre-war year, the amounts of money expended for national defense by the governments of France, Italy, and Germany show enormous expansion, but it should be remembered that the purchasing power of the currencies of these countries has undergone varying degrees of depreciation and that the larger amounts for the more recent years, when reduced to 1913 monetary equivalents, will not show the same degree of expansion as is indicated in the table. During the war years, the proportion of the total expenditures made directly for war was in excess of 80 per cent in all three of these countries. In 1928 the proportion had declined to 25 per cent in Germany, to 22 per cent in France, and to less than 17 per cent in Italy; in Great Britain and the United States, the proportion for the fiscal year 1928 was 21 and 14 per cent, respectively. Nevertheless, the financial burden upon taxpayers in these countries due to military expenditures was much heavier than before the War.

The accompanying table exhibits the post-war burden of taxation in some of the chief countries of the world:

#### PER-CAPITA TAXATION

United States .....	\$70.96 *
United Kingdom .....	70.95 *
Australia .....	45.36 †
Canada .....	38.50 †
Germany .....	31.30 †
France .....	39.41 †
Italy .....	25.00 ‡
Japan .....	10.62 *

\* On basis of 1927.

† On basis of 1926-27.

‡ On basis of 1928.

The question whether some adjustment or alleviation of this tremendous burden can be devised has occupied the attention of statesmen since the close of the War, but has confirmed most in the belief that heavy direct taxes will continue the chief reliance of most countries for a long time to come.

**Government Activity in Business.** The participation of the government in business, which before the War had produced a very considerable element in the revenue system of some countries (e.g., France, Germany, Austria, and others), received a substantial extension in

consequence of the War and of necessities attendant thereon, but the success obtained has been so slender as to produce a reaction of opinion among those who in former years regarded public activity of this kind as a probable source of future increase in revenue yield. Railroad operation, which was undertaken on an extensive scale both by Great Britain and the United States, proved an actual source of loss and was discontinued in both countries. The operation of ocean-going ships was equally disappointing and state manufacture of various kinds of commodities turned out even more unsuccessfully than during pre-war years. Instead of assuming an increasingly important position in budgets, revenue derived from industrial and business occupations has not only come to form a smaller and smaller proportion of total income; but, as just stated, it has been obtained under circumstances of such difficulty as to make it clear that it must be regarded as an inadequate reliance for the future.

tive purposes. The tariff of the United States adopted in 1922 (Fordney-McCumber Act) with subsequent administrative changes of duty made by the President under the so-called "flexible tariff" sections, has been unexpectedly large in its yield, the annual income amounting to as high as \$600,000,000. In 1929 a further revision of the tariff was undertaken and the Hawley Bill was prepared in the House of Representatives. European tariffs have been steadily raised, partly under the influence of need for more revenue, partly as a result of nationalistic aspirations. So extravagant did rates seem in 1926 that an international group of business men combined to issue a joint letter of protest against the tendency. The drift toward higher rates has, nevertheless, continued.

One feature of the tax system of the War was the great extension of internal revenue duties, especially taxes on articles of luxurious consumption. These taxes proved so unpopular that the greater share of them was abolished.

## REVENUES AND EXPENDITURES OF EUROPEAN NATIONS, 1904-1928:

\* total expenditures

Tariffs and Internal Revenue. Highest productiveness was believed by some to have been reached in the tariff system of the United States prior to the War, with a revenue of about \$350,000,000 as a maximum. In Europe, the productiveness of tariff duties had declined as rates increased. During the War, tariff systems fell into disorder and yielded far less than normal returns, owing to the interruption of international trade or its distortion as a result of war demands. After the War, a new era of tariff taxation set in, based upon the nationalistic spirit and essentially intended for protec-

The United States eliminated a large portion of its consumption taxes from and after Jan. 1, 1922. In all countries, taxes on tobacco and liquors continued very heavy with increasing returns. In the United States, however, the adoption of the prohibition system largely eliminated the regular yield of the liquor taxes.

State and Local Taxation. As a result of war demands, local expenses, as well as national, greatly increased. Such increase in expenditure was met chiefly through an advance in the rate levied upon already existing objects of tax-

tion. In the United States, however, State income and inheritance taxes were given a very considerable development, while in some cases surtaxes were added. Real-estate taxation became much heavier both in the United States and in Europe. Public debts were largely added to among local governments and the tendency to increase in that direction was furthered by bonus distributions to ex-service men, the borrowing for this purpose being rendered easier through exemption of bonds from taxation.

**Budget of the United States.** In all countries, the importance of budgetary control was emphasized as a means of economy. An effort to introduce a budget system into the financial organization of the United States was made early in the administration of President Harding, being recommended in a message to Congress on Dec. 5, 1921. This was the result of about 12 years of discussion beginning during the administration of President Taft. On June 10, 1921, Congress approved a law providing for a national budget system and a bureau of the budget. Appropriations in Congress, however, continued in the hands of the numerous Congressional committees vested with the power of appropriation and resulted in preventing the development of a genuine budget system analogous to that of European countries. In fact, on various occasions, Congress disregarded the budget estimates and appropriated money according to its own inclination. On the other hand, savings which were nominally introduced as a result of the budget system turned out to be illusory in some cases, owing to the fact that they were merely due to curtailments of allowances for upkeep which eventually had to be restored although temporarily interrupted.

**Changes in Public Debt.** It follows closely from what has been said with respect to public finance that the period 1914-29 was notable in its relation to the public debt. Like the growth in public revenue and expenditure, the growth in debt was practically universal in all countries, although not proceeding in the same proportion in all; but in the main, the experience may be described as a universal advance in world indebtedness. The outstanding facts in the situation as affecting the principal countries are reviewed in the accompanying table.

Taxation in France followed a course rather different from that pursued in the United States. The first new impositions adopted in 1914 were made effective in 1916 and applied to incomes in excess of \$1000 with excess-profits rates running up to 50 per cent. On July 1, 1916, a special war levy was made on all citizens who had not actually served with the troops, and fees and stamp dues, as well as taxes on investments were generally raised. In 1917 and 1918 extensive luxury taxes were introduced. After the War, continuous legislation on taxation was proposed but the situation was never taken in hand very vigorously until early in 1924 when the absolute necessity of equalizing the budget became evident. At that time, general revisions occurred, the actual burden of taxation being greatly increased not merely by legislation but also by more thorough and inclusive administration and real collection.

Germany, in the belief that the War would be short, attempted to do without new taxation, but in 1915 provided for a substantial increase, applicable largely in the several German states. The Imperial government in 1916 imposed war-profits taxes, excess-profits taxes, and others, be-

sides taxes on transactions and various objects of consumption. In 1918 internal revenue duties were extended and the rates on war profits were made heavier. After the War, and finally as a result of the ultimate reparations negotiations, a new and far heavier system of taxes was installed. A similar policy of waiting prevailed in Austria, although as the War progressed advances were made from time to time. After the close of the struggle, a complete financial reorganization occurred, but the resources of the nation had been so greatly reduced that its revenues from taxation were scanty notwithstanding heavy per-capita charges.

Italy, on the other hand, recognized the necessity of heavier taxation practically from the beginning of the War, but was not very successful until the struggle was nearly over. In 1918 there were great extensions of luxury and consumption taxes and in 1919 a supplementary income tax. These were followed by extensions and changes under the Fascist regime which brought the average burden to a high level in 1928. In the minor European countries, no general or uniform policy was pursued, some increasing the revenues through taxation while others relied largely on loans and indirect taxes.

In the United States, as a result of continuous agitation, the administration of President Coolidge obtained from Congress at the session of 1923-24 the adoption of a more thorough plan of tax revision than that adopted in October, 1921, basing the demand upon the presence of an expected surplus in the budget for the fiscal year 1925. This was followed by other minor reductions and rearrangements, the latest in 1928.

Among the minor European countries budgetary progress was slow, while in Germany the unsettlement with regard to reparations and the unsatisfactory industrial conditions resulted in continuous deficits.

As already incidentally noted, this growth in indebtedness is to be ascribed in part to actual military expenditure, in part to the protection of neutral frontiers, and in part to the advance of prices and wages. Which one of these factors was predominant in any given country, is possibly a matter of secondary interest. The significant facts relating to the debt situation are, first of all, the actual growth of indebtedness as just surveyed, and secondly the methods by which the debt position at the end of the decade was attained as throwing light upon the problem of reduction.

A feature which distinguishes the financial experience of the war period from periods of similar trial in the past relates to methods of public borrowing. During the War, a probably unprecedented use was made of the short-term obligation, while at the same time the plan of funding the short-term obligations thus incurred into long-term debt was carried to a higher point of development than ever before. The use of this method was practically identical in all of the belligerent countries, but naturally was carried on with far greater success in certain of them, owing to the fact that a greater degree of responsiveness on the part of the public was achieved in some than in others. This method of borrowing, as developed most successfully in England and the United States, was substantially as follows: A given quantity of revenue having been estimated as necessary

within a specified period, funds were then obtained direct from the banks through the issue of certificates of indebtedness or treasury bills, or the equivalent. These short-term obligations usually ran for only about three months. The intent of every issue was to obtain steadily from the community a proportionate part of its current earnings and thus to make sure of drawing off from the general fund of commercial income a sufficient amount to provide for public necessities. In placing these certificates with holders, use was usually made of the central banking mechanism, the method being substantially the same in Great Britain and in the United States. Certificates issued by the Treasury were placed in the hands of reserve banks which distributed them at first voluntarily and later by a process of assignment to members. The proceeds were marked up on the books of the subscribing banks as a credit to the Government. These deposits were then called when necessary, the Government giving as much notice as possible, and also endeavoring to pay out the funds as nearly as possible in the parts of the country from which they were drawn. After a period of some months had elapsed, a general loan was offered to the public and when subscribed, the proceeds were used to redeem the certificates and thus to reimburse the banks for the amounts they had advanced. Success in the method was dependent upon payment by buyers of the long-term bonds in actual cash or bank credit, but, as the War advanced, the practice grew of making a small preliminary payment, borrowing the remainder at the buyer's bank. The result then was chiefly to convert the obligation of the Government into the obligation of the individual citizen, presumably to be paid for out of his income or savings. As the floating debt outstanding increased in this way, and as the amount owing by bond buyers to the banks for the purchase of bonds increased, inflation naturally resulted, owing to the fact that bank credit was greatly outrunning in its rate of growth the rate of production of commodities. The effect was very largely the same as that which had been produced in former wars through the issue of irredeemable currency. Upon the close of the War, the stronger governments took measures to reduce their outstanding floating indebtedness, but during the first two or three years after the close of the struggle, the only countries that made any material progress in this direction were Great Britain and the United States. Italy later began to take steps along the same line but other belligerents met with no success.

**Internal and External Loans.** At the opening of the War, much discussion developed in all countries as to the relative advantage of internal or external loans. Embargoes and blockades made it possible for some to borrow abroad, but the major belligerents, as the War advanced, tended more and more to draw upon foreign markets. The United States was naturally regarded as a primary source of such loans, although during the early years of the War, London houses succeeded in distributing a great many of them. As the War advanced, investors grew more and more hesitant, and it became necessary to negotiate not with foreign investors but with foreign governments, either obtaining their permission or when possible inducing them to advance the funds themselves.

Thus arose the enormous international obligations which assumed a size that was wholly unprecedented and in a very real sense constituted a new phase of national finance. After the close of the War, there ensued a period of funding during which the outstanding foreign debts were converted largely into permanent bonds. Great changes in amount occurred. This period is still incomplete.

The table on page 547 reviews for several of the belligerent countries the situation at about the middle of 1927 (when conditions were most critical) as regards the division of public debts between internal and external obligations.

**War Banking and Finance.** From the date of the entry of the United States into the War, the function of the Federal Reserve System became almost exclusively that of financing the process of borrowing from the people. During the years 1917, 1918, and 1919, the Government increased the national debt from a little over \$1,000,000,000 to a little over \$25,000,000,000. These great loans were for the most part placed first through the banks and then with the rank and file of the investing public. It would probably have been impossible to dispose of the enormous quantities of bonds which the Government was obliged to sell in order to provide itself with funds without some kind of special banking aid. Such aid was particularly necessary in view of the fact that it had been determined by the Treasury authorities to dispose of the bonds at a rate of interest quite materially below the prevailing rate in the market. The first issue of Liberty bonds was sold at  $3\frac{1}{2}$  per cent and as subsequent issues were put out the rate was gradually raised until it reached  $4\frac{1}{4}$  per cent on the fifth, the Victory Loan (1919); although it should be remembered that the first loan bearing  $3\frac{1}{2}$  per cent had been wholly exempt from taxation of all classes, while subsequent loans were only partially so exempt. That the public might be induced to purchase up to the full extent of its saving power, paying for the bonds it thus bought on the installment plan, Federal Reserve Banks were instructed by the Government through the Federal Reserve Board to fix a rate for the rediscount of paper equal to the coupon rate on the Liberty bonds. Commercial banks generally were induced to discount directly for their customers at the same figure. Thus a buyer of bonds who was unable to pay for them in full, borrowed from his bank the additional amount he needed, the bank carrying it without cost to him since the coupons provided for the borrower's own interest charge. The bank then rediscounted such paper at the same (coupon) rate with the Federal Reserve Bank of its district. This policy was very successful in "stabilizing" the rate of interest, but it also tended to transfer the principal burden, for the time being at least, to the banks. The system was perfected through the steady issue of Treasury certificates sometimes as often as twice a month, these certificates running for 90 days as a rule and being funded at the end of that period into the successive issues of Liberty Bonds which were then subscribed for and carried as indicated. The burden resting upon Federal Reserve Banks thus became heavier and heavier as the War advanced and as successive issues were sold. Hence the reduction of the reserve ratio (ratio of gold to demand liabilities) of the system, which fell from about 90 per cent

before the War to about 52 per cent at the end of 1918, shortly after the Armistice. The fifth Victory Loan, which was floated early in 1919, was sold upon the same general principles that had been pursued in the earlier financing and resulted in increasing the burden resting upon the reserve system still further. The successful floating of this loan was followed by a speculative development of business and especially of foreign trade, which continued during the year 1919, and although checked early in 1920 did not reach its peak until about the close of the latter year.

Prices during the War had tended to rise rapidly as a result of a variety of causes. Of these, the principal was the tremendous demand exerted by all governments for commodities, coupled with the natural shortage in production which resulted from the withdrawal of a large part of the productive labor of all of the Western nations for the purposes of war. A contributing cause of the rise in prices, however, was found in the suspension of specie payments and excessive issue of currency which produced the condition of "inflation" reflected in unduly high prices for commodities and services of all classes. This price and wage advance continued steadily up to a peak in May, 1920, at which time the index number of prices was approximately 270 measured from a base in 1913 taken as 100. The check to expansion and wholesale-price advance administered early in 1920 has been variously explained and has been popularly attributed in the United States to the fact that Federal Reserve Banks toward the end of 1919 resolved upon the so-called deflation policy.

This deflation policy took form as an advance of interest rates above the low levels that had been established during the Liberty Bond period. It was aided by a more strict interpretation of the eligibility of paper for rediscount, coupled with an effort to induce borrowers who had obtained advances on Liberty Bonds as collateral to settle these loans and thus to take them out of the banks. The inadequacy of this explanation is indicated by the fact that the recession in business and prices which set in early in 1920 did not originate in the United States but was first indicated by the collapse of the silk market in Japan, while in most foreign countries no very definite deflation effort was undertaken until after the business recession had begun.

Federal Reserve discounts did not reach their peak until the end of 1920, about eight months after the business decline had started. At that time, total assets of the Reserve Banks were approximately \$5,000,000,000 while bills discounted were about \$2,700,000,000 and currency outstanding was about \$3,336,000,000. As the decline of business became more pronounced during 1921, the price level gradually sank to approximately 140, or a little more than half its level at the peak, while discounts at Federal Reserve Banks had been reduced by the end of 1921 to less than \$1,150,000,000. Notes at the same time receded to about \$2,400,000,000, thus contracting over one-fourth of their maximum amount.

The inability of foreign countries to settle their enormous purchases in the United States had led during the War to very heavy advances made by the Government to foreign governments and expended almost entirely in the

United States. These advances were to be continued until about the middle of 1919, eight months after the Armistice, and amounted to about \$9,500,000,000. When they came to a close, there ensued a period of trade expansion already noted during which considerable advances were made by American banks and business houses for the purpose of carrying foreign buyers as long as possible. As it became more and more evident that foreigners would not be able to liquidate these debts in full, banks and exporters began to withdraw these credits and the large movement of gold into the United States which had been very marked during 1916 and 1917 was resumed.

From the opening of the War in 1914 to the close of 1923, the total net importations of gold into the United States amounted to about \$2,150,000,000 and the total gold holdings of the Federal Reserve Banks rose to about \$3,200,000,000. At the same time, the ratio of reserve to liability advanced to approximately 78 per cent. The vast accumulation of gold thus attained by the Reserve Banks was maintained for a year or more nearly intact, but the period of influx was followed by a transition period in which irregular and fluctuating movements became characteristic, and this in turn gave way to an outflow which in 1927-28 took over \$500,000,000 of gold out of the United States. Much of this metal went to France and to other countries which were reestablishing their vault reserves preparatory to monetary reform.

The general situation and development of the Federal Reserve System during the two years following the close of the inflation period was substantially as follows: Immediately after the completion of the task of readjusting the discount rates and business which culminated in the spring of 1921, Federal Reserve Banks endeavored to return to a basis in which their principal activity would be devoted to commercial undertakings while they sought to divest themselves so far as they could of government obligations and to induce the investment public to take up and hold such securities.

The result was a steady decline in their activity, since they had consistently refused to enter into any considerable competition with the larger member banks which held their stock. Coupled with this change of policy was a second remarkable transformation of their position, owing to the steady and great movement of gold into the United States, which resulted in building up enormous specie reserves in the hands of Federal Reserve Banks. When recovery from the speculation in commodities which had brought on the depression of 1920-22 was fairly complete, influx of gold combined with other factors to induce a period of low discount rates. These were availed of to aid Great Britain and other countries in restoring a gold standard of currency, and through international agreements between the Reserve System and the Bank of England, rates were forced still lower. The outcome was an unprecedented era of stock speculation centering in New York during 1927-29.

**Federal Reserve System.** The war period with its sequel had a peculiarly important relationship to American banking conditions because of the fact that, simultaneously with the opening of the War, the United States had arranged to organize an entirely new banking system—the so-called Federal Reserve. This banking system had been framed entirely

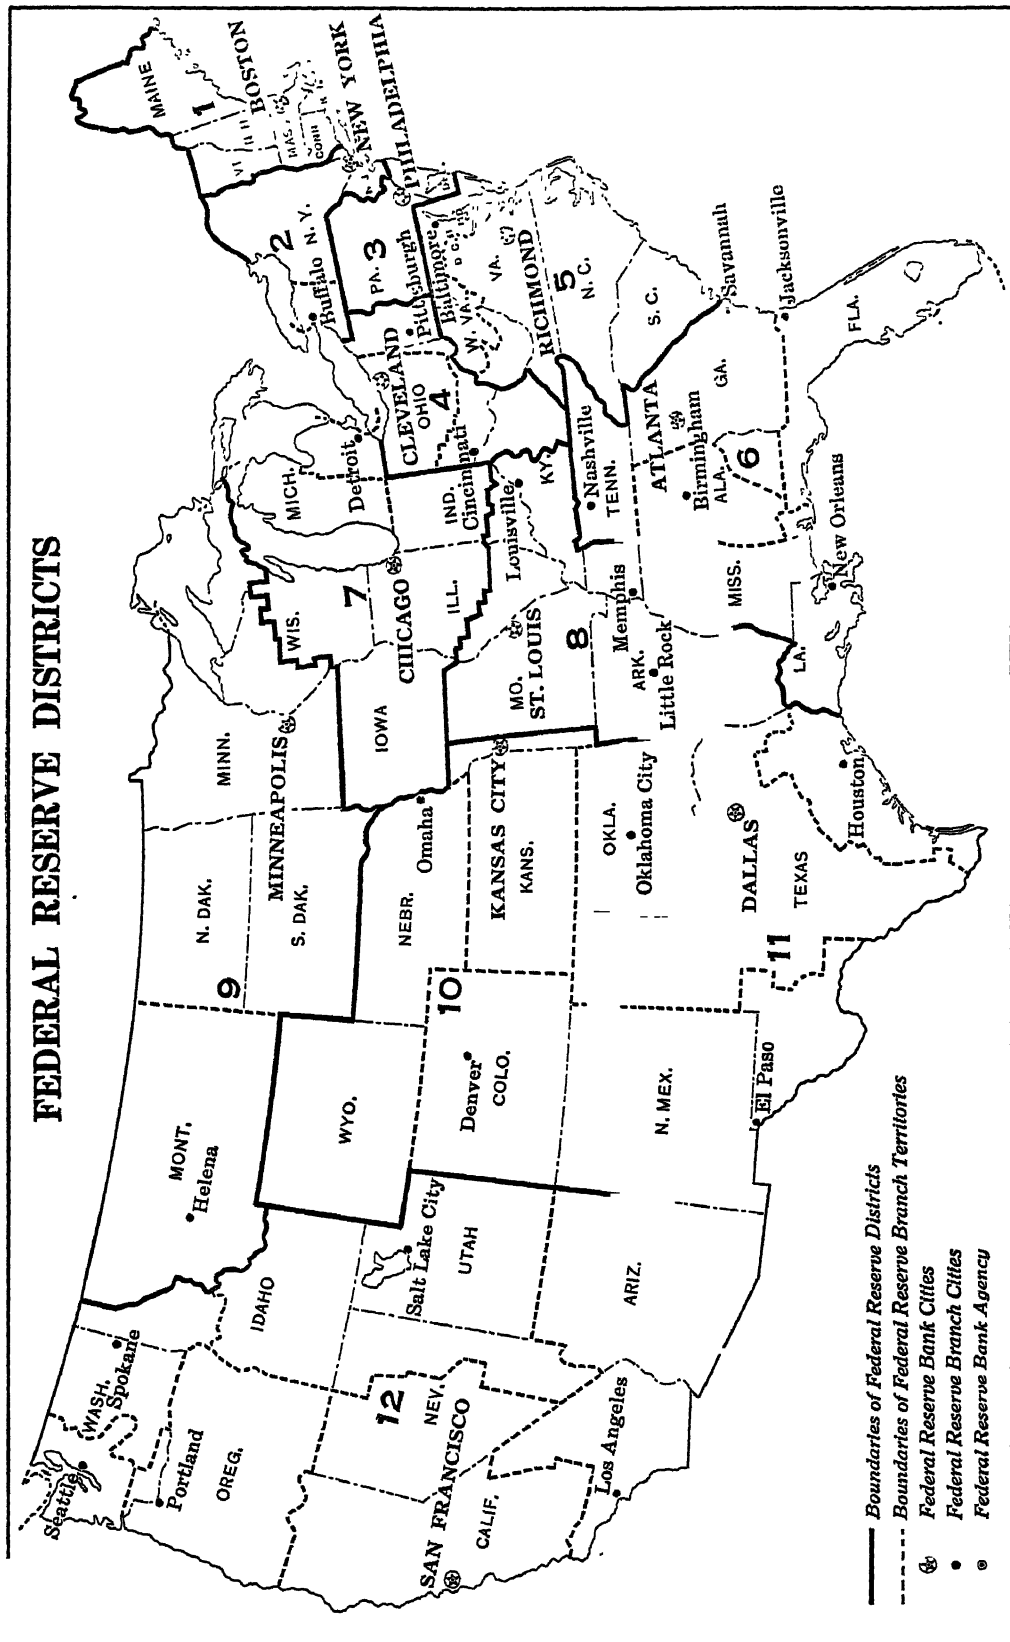

without reference to war necessities but was just on the point of taking effect when the struggle broke out in Europe. During the first two years—1915 and 1916—in which the United States was a neutral, the Federal Reserve System was practically in process of organization and the task of installing its various elements was in progress. Its business during that period was small; but with the entry of the United States into the active participation in the struggle early in 1917, the Federal Reserve System became a war banking system almost exclusively, and this character it retained until the struggle was over and the great advances made by the United States to European countries had been completed and the Liberty Bond issues largely growing out of them had been financed and digested by the banks and the public. Thereafter, the Federal Reserve System was able once more to turn its attention to the tasks of peaceful finance and to assist in restoring more normal condition.

Immediately after the inauguration of President Wilson in 1913, a bill which had previously been developed under the direction of a sub-committee in the preceding Congress was introduced (June, 1913) and thereafter considered and adopted by the House of Representatives on September 17. This measure was considerably modified in the Senate, but in conference committee it was amended back into nearly its original form, becoming a law on Dec. 23, 1913. As thus passed, the act provided for the establishment of a Federal Reserve System in which all national banks were obliged to take membership by subscribing 3 per cent of their capital and surplus to the stock of institutions to be organized in a number of districts throughout the country and known as Federal Reserve Banks. These banks were corporations chartered for 20 years under Federal authority, receiving deposits only from the Government and from their member banks (though subsequently allowed to receive deposits from other banks under certain conditions), their chief duties being the issuing of notes and the holding of the reserves of their members. Their business consisted primarily of rediscounting paper for their members, although they were also authorized to buy paper (of the same kind that had been made rediscountable) in the open market, should they see fit. In issuing notes, the Reserve Banks, as they were popularly called, were authorized to deposit eligible rediscounted paper with their chairmen (the Federal Reserve Agents), acting as trustees for the Government, which then issued an equal amount of notes to the Reserve Bank. The latter then placed them in circulation by paying them out or handing them to members who had requested such accommodation. By a later amendment, gold might also be deposited with the chairman of the local board in lieu of eligible paper. These notes were made obligations of the United States and receivable for all public dues. An organization committee, created under the act, eventually divided the country into districts and established twelve banks.

Government control of the institutions was provided for by authorizing the Federal Reserve Board to name three out of nine directors for each of the Reserve Banks, the other six members being required to include three business men and three bankers, one business man and one banker being selected by banks voting individually, in

# FEDERAL RESERVE DISTRICTS

each of three distinct groups (including the small, medium, and larger banks of each district). It was further provided, in order to insure democratic government of the banks, that each bank should have but one vote regardless of capitalization. With reference to reserves, the act required that the 25 per cent reserve formerly required in central reserve cities be cut to 18 per cent of demand obligations; likewise also the 25 per cent formerly required in reserve cities was cut to 15 per cent, and the 15 per cent in other places was cut to 12 per cent. Of these reserves, 7 per cent was to be placed by central-reserve-city banks with their reserve bank, 6 per cent by reserve-city banks and 5 per cent by all others. Time deposits were made subject to a 5 per cent rate throughout. Federal Reserve Banks were to be authorized to pay 6 per cent cumulative dividends, after all expenses and allowances had been provided for, to their stockholders, and their remaining earnings were then to be paid to the Government.

An important feature of the act on its foreign banking side was found in the authorization granted the larger national institutions to establish branches abroad and in its grant of the power of accepting time bills (not over 90 days' maturity) to national institutions. In their ordinary rediscount operations, the Reserve Banks were limited to 90-day paper growing out of commercial, agricultural, or industrial transactions, speculative paper being barred.

The act as thus adopted was subsequently modified by a series of enactments. The important features in these amendments were:

(1) enlargement of the acceptance power to 100 per cent of capital and surplus; (2) permission to National banks to subscribe to the stock of foreign banking enterprises formed for the purpose of establishing branches abroad; (3) termination of the reserve requirements of the original law and substitution therefor of a provision requiring all reserves to be kept in Reserve Banks, such reserve to consist of 13 per cent of demand deposits for central-reserve-city banks, 10 per cent for reserve-city banks, 7 per cent for all others, with time deposits at 3 per cent; (4) adoption of the so-called Edge Act authorizing the formation of corporations, for the purpose of making long-term investments abroad, National banks being permitted to subscribe to their stocks; (5) enlargement of amount of loans permitted to be made on the strength of Liberty bonds as collateral; (6) modification of voting arrangements governing the elections of directors in Federal Reserve Banks; and a few others. Of these amendments, the only one which fundamentally altered the structure and significance of the act was that transferring the entire reserves to the central institutions and the Agricultural Credits Act of 1923 which gave special privileges to paper growing out of farm credits (see AGRICULTURAL CREDITS). The so-called McFadden Act, of 1927, chiefly designed to relax the restrictions upon National banks, incidentally enlarged the rediscounting power and further gave to Reserve Banks "perpetual" or indefinite charters, revocable by Congress for cause.

As provided for by the Act of 1913, the Federal Reserve System went into operation (preliminary details having been arranged by an organization committee) technically on the 10th of August, 1914, the banks themselves being

actually opened for business on November 2, while reserves were paid over on November 14 of the same year. The two years 1915-16 were occupied largely in developing methods of discounting and establishing new plans of note issue. A constructive piece of work carried through during these years was the establishment of the Gold Settlement Fund at Washington; whereby the Federal Reserve Banks were enabled to clear on the central set of books conducted by the board the bulk of their obligations against one another, thereby avoiding the shipment of specie. This clearance, at first carried on once each week, was later made a daily clearance, and eventually came to supersede in large part the work of the local clearing houses.

With the entry of the United States into the War early in 1917, a new epoch in the history of the Federal Reserve System and of the banking system of the United States in general opened. The fundamental problem at the opening of the War was that of finding means to supply the Treasury with necessary funds. This object was temporarily accomplished by direct borrowing from the Federal Reserve Banks on short-term treasury certificates. The system of Liberty Loans was then developed and the Reserve Banks were made the active agents of the Treasury in placing them. The Federal Reserve Act had originally provided for making the banks the fiscal agents of the Government and this was now interpreted to include not only sub-treasury functions but also those relating to the sale and distribution of bonds. The importance of the sub-treasuries accordingly was reduced and they were eventually closed in 1920, but during the latter part of the War and the period just after it, their activity was purely nominal. With the issuance of the First Liberty Loan in July, 1917, the activity of the Federal Reserve Banks was largely transferred to a war basis, including the management of public finance, and continued so throughout the remainder of the struggle.

**Development of Clearing System.** The national system of clearance which has constituted one of the most outstanding achievements of the Federal Reserve Board under the mandatory provisions of the original act had attained only a moderate degree of development prior to the close of the War. It was not put into effect at the outset of the Federal Reserve organization, but first took form in a definite way on July 1, 1916, when arrangements were made for collecting checks on member banks or on non-members which remitted at par without charge for exchange or collection. Credits and debits were entered upon a deferred basis corresponding to the amount of time required actually to collect the items. From the time that the system was fully inaugurated, the totals transferred by this means rapidly grew, the system largely superseding clearing houses in many parts of the country, a number of the latter being closed in the meantime, as a result. Owing, however, to the fact that as a result of the clearance at par without charge many small banks lost a valued source of income, criticism arose and during the years 1920-23, hostile legislation was undertaken in eight Southern States and suits were brought against Reserve Banks for the purpose of having their clearance function declared unconstitutional. Several of the cases were finally carried to the Supreme Court. In these, the exercise of the clearance function

was upheld, subject to some important reservations, but the latter resulted in considerably restricting the power of the Reserve System and substantially lessened the total number of banks remitting at par. Nevertheless, the par collection system has had a normal growth by reason of its own recognized merits and has greatly reduced the evil of high exchange charges the country over.

**Inter-Governmental Debts.** When the United States entered the War, it found nearly all of the Allied powers approaching exhaustion. England had previously made large war loans to the Allies; but could no longer continue them. Advances were accordingly authorized by Congress in 1917 from the Treasury of the United States. They were steadily made during the remainder of the War and were continued about eight months after the conclusion of the struggle. Thus a total sum of about \$9,500,000,000 was loaned, the proceeds being used in large measure for buying in the United States commodities that were needed for exports. The debts thus contracted were represented by temporary certificates evidencing the obligations in question and signed by the representatives of the various borrowing European countries. Eventually, the question of "funding" or pro-

viding for their definite payment and for the rate of interest they should bear meanwhile became a pressing question. No interest on them had been paid from the time of their issue and Congress eventually passed, on Feb. 9, 1922, the so-called Debt Funding Commission Act in which a commission of five, headed by the Secretary of the Treasury, was directed to make arrangements for settling the obligations of the various countries. These obligations growing out of the War, but not including bonds received from the sale of surplus war supplies and other transactions, and amounting to \$473,000,000 were eventually established as follows:

Bonds of foreign governments received under agreements for funding of their debts to the United States, pursuant to the acts of Congress approved Feb. 9, 1922, Feb. 23, 1923, Mar. 12, 1924, May 23, 1924, Dec. 22, 1924, Apr. 23, 1926, Apr. 30, 1926, and May 3, 1926.

Belgium	\$411,130,000.00
Estonia	13,830,000.00
Finland	8,764,000.00
Great Britain	4,480,000,000.00
Hungary	1,942,200.00
Italy	2,027,000,000.00
Latvia	5,775,000.00
Lithuania	6,218,167.50
Poland	178,560,000.00
Rumania	65,660,560.43
<b>Total</b>	<b>\$7,198,879,927.93</b>

Obligations of foreign governments, under authority of acts approved Apr. 24, 1917, and Sept. 24, 1917, as amended (on basis of cash advances, less repayments of principal):

Czechoslovakia	61,974,041.10
France	2,911,507,904.09
Greece	15,000,000.00
Russia	187,729,750.00
Serbia	26,052,753.01
<b>Total</b>	<b>3,202,264,448.20</b>

Some relatively small loans had likewise been made by sundry of the Continental powers to one another, France advancing nearly \$2,500,000,000. Out of this situation arose in 1919-22 the demand for international debt cancellation. The result was a long-drawn series of negotiations resulting in some settlements but still leaving, at the end of 1928, many unadjusted accounts.

**German Indemnity.** The most troublesome phase of the debt situation produced by the War grew out of the establishment of an indemnity or reparation for Germany. (See REPARATIONS for an extended treatment of this subject.) Because of the inability of the Powers to hasten a settlement, the questions of international debts and reparations passed into a waiting stage which lasted for several years. The only important progress during the period was the funding of the British debt to the United States which was finally effected in January, 1923 (formal agreement, June 18, 1923). Great Britain recognized the entire indebtedness and arranged to pay it over a period of about 61 years with an annual interest rate of 3 per cent, rising after 10 years to 3½. As the United States had outstanding the bonds which were issued to provide the funds advanced to Great Britain, and was paying 4½ per cent on them, the arrangement with Great Britain was equivalent to partial cancellation, although not technically so. Reparations problems, however, were growing more and more acute, and the general disorganization of economic life in Germany was so serious and extensive as to compel resort to new remedies. The result was an international

conference which at Paris in 1924 formulated the so-called Dawes plan under which German payments were placed in the hands of a reparations agent who was to collect annual payments rising gradually to 2,500,000,000 marks in and after 1929. This plan had been carried into effect up to the opening of 1929 when a new conference was summoned, which continued until June when a plan of settlement was announced. This was the so-called Young Plan. It slightly reduced the annuities payable by Germany and received final discussion in an international conference at The Hague which closed at the end of August. See REPARATIONS.

Meantime the United States, through the World War Debt Funding Commission, had negotiated treaties modeled on that with Great Britain, twelve in number and amounting to a cancellation of from 35 per cent to 75 per cent of the debt owing by various countries. All had been ratified at the opening of 1929 except that with France. The French treaty was acted upon by the Chamber in the summer following.

**Debts, Prices, and Exchange.** The growing proportion of debt both before and in a more striking degree after the War, as compared with the volume of national wealth, became an alarming feature because of the disproportionate absorption of national income in meeting debt charges. Inasmuch as existing debts were incurred in units of currency of the pre-war gold value, attempt to pay them in full at the close of the period would involve an enormously greater transfer of wealth than that which was originally borrowed. Alternative to such a course would be the partial repudiation of the debts, either by "devaluation" (change in the gold equivalence of the currency unit) or by the co-called "capital tax," which amounts to an appropriation of enough of the wealth of the propertied class to pay the state's debt to that class. Some settlement of this question would be necessary if the countries were to attempt to restore a sound banking and currency system. The difficulty in the case was particularly marked in those countries which have heavy foreign debts because they must usually settle in terms of gold. This difficulty, so far as internal debt goes, has been technically met in various ways. Great Britain, by returning to her old gold standard at par, accepted the full face value of her original pound sterling. Germany, on the other hand, practically wiped out (with some trifling exceptions and allowances) the whole

of her internal debts by abandoning her old currency, which had been almost immeasurably depreciated in 1924, and substituting a new unit equal in gold value to her old mark, but now called the Reichsmark. France and Italy pursued the policy of devaluation. Each had had before the War a currency unit worth 19.2 cents gold, but Italy stabilized in 1927 at about 5¼ cents and France in 1928 at about 3.04 cents.

**Proportion of Loans to Taxation.** Authorities on public finance prior to the War had generally taken the view that no public loan should ordinarily be floated without the imposition of taxation in an amount sufficient to provide for interest on the principal thus created and for an amortization or sinking fund sufficient eventually to extinguish the debt. At the opening of the War, there was a widespread opinion among theorists both in the United States and Great Britain in favor of restricting loans to not over 50 per cent of total outlay, the balance to be raised by taxation. On the Continent, governments found their populations very restive under taxation and before the War were disposed to make use of deficit financing through public loans because of the already existing burden. During the War, both Germany and France relied largely on borrowing. No consistent policy of financing in this respect was pursued during the War.

**Change in Revenue Systems.** In the endeavor to avoid unnecessary increase in debt, England and the United States early in the War resorted to heavy taxation, adopting income and excess-profits taxes upon a large scale and particularly advancing the rates of surtax up to figures never before thought of. Other countries were slower to resort to heavy taxes because of the reluctance of their own citizens to submit to such control, yet it was practically inevitable that they should eventually do so and in substantially all countries there was an effort to get away from public borrowing and shift over to a basis of budgetary balance. Only by so doing, it was recognized, would it be possible to restore a condition of solvency in the principal countries. The result of this necessity was to emphasize the finding of new sources of income and hence the reconstruction of fiscal systems. How this change worked may be noted from a comparison of the sources of income in France, Germany, and the United Kingdom, shown in the following table.

**Relations with Banks.** Owing to the fact that the War took all countries by surprise, bank loans were necessary in nearly every case in order to furnish funds for immediate requirements. This was an inevitable episode in war finance and was not open to criticism except in so far as it might be adopted as a systematic policy. Fear of popular discontent led a good many countries to continue the short-term financing much longer than they otherwise would, the only countries that possessed the real internal strength to tax severely and effectively during the War being Great Britain and the United States. In falling back upon the banks, the various governments resorted to methods of borrowing that had not been tried in precisely the same form during the course of former struggles. Relatively small use of legal-tender paper or "flat money" was made but the banks were required to take and distribute short-term obligations which were then funded from time to time into longer-term loans, as circumstances seemed to permit. The fact that the subscribers to these loans were encouraged to borrow from the banks the funds which were necessary in order to enable them to make good their subscriptions naturally tended to produce in all countries a highly inflated condition of prices, together

with a steady disappearance of specie, notwithstanding an early embargo upon movements of coin which took effect in nearly all countries, comparatively early in the struggle although at slightly differing dates.

The United States was the last to declare such an embargo, owing to the fact that it did not enter the War until the year 1917 was well advanced. Heavy borrowing at the banks in nearly all countries left these institutions at the close of the War in a very unliquid condition, their government paper holdings being "frozen" owing to inability to find buyers for them either at home or abroad due to the deterioration of public credit. But reliance upon foreign borrowing which was characteristic of practically all European countries that had found themselves able to get access to other markets, left all of them at the close of the War with tremendous external obligations which they were in no position to liquidate, owing to the fact that as a result of the conflict their productive power had been very greatly decreased. An unavoidable consequence of the drawing off of a large share of the population from economic occupation had been in all of the combattant countries a corresponding curtailment of productive effort.

The close of the War, therefore, found practically all European countries facing a highly complex problem in public finance—that of reducing the cost of their government to such an extent as to make it possible to pay the necessary sums from the proceeds of taxation, thereby avoiding further borrowing while at the same time enlarging their surplus export power sufficiently to provide a balance large enough to furnish the necessary funds abroad with which to pay interest and maturing obligations. This latter necessity was the more obvious because of the fact that for one reason or another it had been found necessary to “release” a great deal of gold as the War advanced, thereby reducing the cash stock and in some cases bringing the specie available to so low an ebb that it was exceedingly doubtful whether any restoration of gold redemption could be brought about in the near future.

It remained true, however, that a good deal of the gold “released” had been drawn from circulation leaving the sums in bank reserves relatively little depleted absolutely, though of course wholly inadequate, as compared with the huge outstanding volume of obligations. Great Britain proved to be the only one of the major countries which was able through severe taxation and exchange control to bring her monetary system back to the pre-war base, while in France and Italy, devaluation on a drastic plan was used to bring about a bearable relation between specie and currency outstanding. Germany practically repudiated her currency and made a fresh start, while in other countries various measures of devaluation or revaluation were resorted to. With the aid of the Federal Reserve System, various countries, including France and England, have been able to reimport specie when needed for the building up of their reserves.

\* New index—1926 = 100.

NOTE.—These indexes are in most cases published here on their original bases, usually 1913 or 1914, as determined by the various foreign statistical offices which compile the index numbers and furnish them to the Federal Reserve Board. In several cases, however, viz., France, Netherlands, Japan, New Zealand, and South Africa, they have been recomputed from original bases (1901-1910; 1910-1910; October, 1900; 1909-1913; 1910) to a 1913 base. Further complete information as to base periods, sources, numbers of commodities, and the period of the month to which the figures refer may be found on pages 769-770 of the *BULLETIN* for November, 1927.

**Results of Inflation Policy.** The self-conscious inflation policy which was thus adopted by the belligerent governments soon proved disastrous. It was not only exceedingly disturbing to business, but it also defeated the efforts of the governments which resorted to it as a fiscal expedient. Price levels rose rapidly and enormously in nearly all countries, as may be seen from this table of index numbers.

The effect of this advance in prices, brought about as it was by the practice of borrowing overheavily at banks, was to make commodities and services cost enormously more than they otherwise would. Particularly harmful results were experienced in the case of those countries which found it necessary to apply to foreign markets for munitions and supplies. Nearly all of the European countries had found themselves obliged at an early stage to buy heavily in the United States. Although the American price level had risen considerably even before the United States entered the War, the advance had not been comparable to that which occurred at a later date.

**European Banking Development.** European banking was in a far more stable and completed condition at the opening of the War than was the banking system of the United States, but the strain to which it was subjected was far more severe, relatively speaking, than that to which the United States was obliged to adjust itself. In a general way, the principal effect of the War was to bring about an extensive redistribution of specie, a great reduction in the bank reserves of some countries, an even larger relative reduction in these reserves as compared with outstanding obligations and a very material alteration in the character of the investments held by the banks, this change taking

\* Figures as of last week in month.

form as a great growth in the amount of government paper held by the banks and discounted for the several governments with a corresponding (relative) decrease in the amount of paper discounted for private citizens. A brief general survey of the banking situation of certain principal countries as it has developed during the period in question, and as it stands approximately, is shown in the table on financial statistics on page 558.

**Banking in England.** Opening the War with a well coordinated money and banking system, Great Britain shortly found it necessary to resort to an embargo on gold and an issue of government notes. The result was immediate depreciation of currency, inflation of prices, and disturbance of exchange. This latter gave rise to a "pegging" of the rate, as compared with dollars (and at the same time a pegging of francs in relation to sterling and dollars), the funds therefor being first supplied from the British Treasury and later through loans obtained from the United States. This situation continued until March, 1919, when the pegging was suspended and exchange left to take its own course, the embargo on gold being retained. Almost immediate reaction occurred in the value of sterling, steady recession taking place until Great Britain had been able in a measure to rectify her international position. Thereafter, every effort was directed toward a return to the gold standard, which was provided for in 1925, and at last fully made effective in 1928 through fusion of the war notes with Bank of England notes. Little change occurred in the general structure of Great Britain's banking system as a direct result of the War, although the creation of the Irish Free State separated a portion of the Irish banks from the general British money market, at least in theory, even while they continued to be closely associated with it in fact. Scotch and Irish notes, which had been made legal tender, were deprived of that quality after the Armistice. The Irish Free State in 1926-27 established its own currency system based on a unit equivalent to British sterling.

The principal obvious mark left by the War upon the British banking system is to be found in the great concentration of banking which has occurred, there being today only about 25 banks in the United Kingdom of which by far the more dominating position has been assigned to five or six of the British institutions with headquarters in London.

**European Banking.** The outstanding changes in European banking which took place during the War were, in theory and effect, very similar to those in Great Britain, although usually assuming a more extreme form. In France, a moratorium was declared shortly after the opening of hostilities, applying to deposits as well as notes. This was soon ended, but at no time during or since the War have Bank of France notes been convertible into coin. Today they can be redeemed in bullion in large amounts but the actual gold franc is still theoretical. Large support had been given by the Bank of France to the Government in the form of short-term loans, the result being an enormous increase in note circulation, although changes in the actual structure of banking in France have been fewer than in England. Provisions for the official control of exchange and prohibition of the export of capital were early introduced and have continued in effect. In 1924 France's banking problem was more than ever intimately associated with governmental budget conditions. The decline in exchange which carried the franc down to an ordinary level of about 5 cents soon after the opening of 1924 (a low point of 3.43 cents having been reached in the late winter of 1924), merely reflected the declining confidence of the foreign public in France and her budget management, due to the continuance of extraordinary budgets without provision to meet them, the continued insistence upon reparations at a rate probably out of the question, and the effort to rely upon inflation and short-term loans in lieu of taxation. Conditions became so alarming as to bring about pledges from the Poincaré Ministry in the spring of 1924 bearing upon the reintroduction of budget balances and heavier taxation designed to overcome existing evils. These efforts were successful, the franc being stabilized at the opening of 1928 at about 24 to the dollar by a return to what is called a gold-bullion standard.

In Germany, the shock to the banking system caused by the War was fully as severe as that felt elsewhere, but technically produced no great change during the continuance of the struggle. Early in August, 1914, the Government provided for a legal-tender currency which was later retired, its place being taken by Reichsbank notes. All notes and currency were declared inconvertible and a special type of loan banks was established. Partly as a result of strict military control and government regulation of prices, it was possible to maintain, up to the close of the War, a semblance of solvency. Immediately after the Armistice, this semblance largely disappeared, and rapid deterioration began, partly due to loss of specie, the restoration of the reserves to foreign banks which had been carried away, the necessity of paying for large quantities of raw material abroad and other factors of the same sort. The outcome necessarily was the steady recession of the mark, somewhat aided by apparently intentional inflation with shipment of paper marks and mark obligations abroad. According to expert Committee No. 2, whose report was rendered to the Reparation Commission in April, 1924, careful investigation showed that Germans had in this way disposed of a total abroad of nearly 8,000,000,000 marks, receiving, of course, goods in exchange to an equal amount, the marks in the meantime becoming practically worthless. Increasing difficulty con-

tinued and was greatly emphasized by the inability to obtain any balancing of the budget or any adjustment of reparation claims. The result was the mark was driven to practically nothing, the quotation at about the close of 1923 being \$0.00000000000022. At this microscopic figure, the mark was practically valueless and its place was rapidly being taken by foreign currencies.

Decisive deterioration in the quotation of the mark had set in about the middle of 1922 and continued more or less steadily from that day onward to the autumn of 1923, when effort was made to obtain a substitute currency by organizing the so-called "Rentenbank." This was a bank whose obligations were secured by mortgages upon the lands, houses, and industrial property of Germany, the unit in which they were expressed being designated as the "Rentenmark," presumably equivalent to the gold mark. During the winter of 1923-24, there was also gradually brought into existence under the supervision of Dr. Schacht, the so-called *Gold Diskont Bank*, whose purpose it was to finance foreign transactions. This "gold" bank was such only in name as its capital was largely derived from English sources in sterling, while its foreign payments were made in sterling, it being thus really a sterling bank rather than a gold bank. The reparation committee's plan of 1924 led to the governmentally controlled bank which superseded both of these emergency establishments, becoming a new Reichsbank and reestablishing a gold currency in Germany with corresponding stability in foreign exchange based on a Reichsmark equal to the previous mark. German banking had not changed greatly in its external form, but the same tendency to consolidation apparent in England was felt also in Germany and resulted in a reduction in the number of independent banks, accompanied by some increase in the degree of their dependence upon the Reichsbank.

In other European countries, where central banking systems were in operation practically upon the same general basis as in England or France at the opening of the War, very much the same war changes were experienced. Practically all introduced gold embargoes which were continued after the close of the War and in most of them attempts were made, usually with but little success, to control the direction of foreign exchange. In Russia, practically the entire pre-war stock of specie was taken from the banks and eventually exported. Later, local prosecution and seizure of old hoards furnished a reserve for a new State Bank administering a currency based on the chervonetz, equal to 10 rubles, each equal to the pre-war gold ruble. Austria, too, lost her entire reserve of coin and was obliged to submit to a reorganization of her finance under the auspices of the League of Nations with a gold loan based upon a guarantee by the Allies themselves. In Italy, conditions more closely resembled those of France, and the restoration of governmental frugality under Mussolini had the effect of stabilizing the lira in 1925 and curtailing bank inflation. Among the so-called neutral countries, such as Switzerland, Holland, and the Scandinavian nations, conditions varied somewhat, but the general drift was toward increase of gold owing to payments made by belligerents for supplies that they needed. The result generally was to bring about an overexpansion of gold reserves with a cor-

responding tendency to inflation in bank obligations. Altogether, therefore, the tendency was somewhat parallel to conditions among the belligerents, although for different reasons. Subsequent to the War, this whole group of countries found itself better able to resume the free payment and movement of specie than before the struggle, yet disinclined to do it because of the fact that the principal customers were themselves on a paper basis.

**"Colonial" and Oriental Banking.** Conditions in the colonies of the various principal powers, prior to the War, had been generally dependent upon the situation in the parent countries. The War for the most part threw their systems of money and banking out of gear, partly by cutting off regular trade movements between them and the parent country, partly by leading them to declare embargoes, as in Canada and Australia, in the fear that otherwise they might lose their specie, as well as out of a sense of loyalty to the colonizing nation itself. As a result of these conditions, abnormal difficulties were encountered in those parts of the world where the so-called gold exchange standard had been established, e.g., in India, the effort being there to bring about a conservation of specie and a fair stability of value. After the close of the War these difficulties disappeared in some measure, still leaving the dependencies, such as Australia, Canada, and others, inclined to move parallel to the currency of the parent country.

In Japan, where an independent gold-standard system had existed for many years, the embargo on gold early established during the War was maintained, notwithstanding that the stock of metal there was large and foreign trade in a fairly satisfactory condition. The earthquake of 1927 and the resultant troubles found Japanese business conditions weak and threw them into complete disorder, a general reorganization ensuing. No serious changes in the structure of banking took place in the colonial or Oriental countries upon any considerable scale during the post-war period, perhaps the outstanding development being the creation of a reserve bank in South Africa, closely modeled upon the Federal Reserve System.

In India, the introduction of central banking and a theoretical gold standard resulted from the work of the Indian Currency Commission of 1926. In other countries, effort was made to popularize the banking systems and so far as possible rather to diminish the power of central oversight so far as practicable. A group of new and rather weak central banks came into existence then and there. The future as relating to them is doubtful. Price movements in these economically dependent countries were naturally governed to no small extent by the price movements in the parent country, as may be seen by consulting the table of prices printed on page 555.

**Post-war Changes in Foreign Banking.** The War naturally affected the credit system of all nations very profoundly, resulting in most countries in an enormous expansion of credit both in the form of notes and of deposits, while practically everywhere the banks of the several countries became overloaded with government securities of various kinds either purchased for their own account or taken as collateral behind paper which had been left with them by customers for the purpose of carrying these bonds

pending gradual liquidation of subscriptions to them. After the close of the War, the general development of banking in most countries passed through considerable changes of volume and character of transactions but the alteration in banking structure was comparatively slight. The decade after the War was a period of restoration of sound conditions in banking rather than of real change in structure.

The general effect of the War, as noted above, was to tend toward concentration of banks—England, for example, reducing the number of institutions from upward of 100 to only about 25, of which five were of preponderating importance. In France, the drift toward concentration was not so strong because France had already reached a highly concentrated position in banking prior to the War. In Germany, the Reichsbank became little more than a tool in the hands of the Government, being used there for the purpose of floating short-term loans and later of issuing paper currency in almost unlimited volume to care for the needs of the Government and avoid the necessity for heavier taxation. After the War and as a result of the reparations discussions culminating in 1924, the Reichsbank was entirely reorganized but largely on former lines. In Italy, the whole power of note issue was placed in the hands of the Bank of Italy which became a central institution in the modern sense.

Another phase of post-war banking was seen in the fact that the portfolios of practically all European institutions changed greatly. In lieu of the short-term paper which formerly occupied so nearly exclusive a place, the primacy was taken by government obligations and so-called short-term notes, "direct advances to the state," and other types of public obligations. Still a third important change in the situation after the War was seen in the fact that so many banks and banking institutions were either driven into failure or obliged to go out of business or to amalgamate with others because they had become overburdened with non-liquid paper. The banks in such cases frequently were found to have ventured a good deal of their funds in foreign trade operations of one kind or another and there was great mortality and severe losses among the foreign banks of the world at large.

In the United States, there was a rapid, but not very successful, development of foreign banking during the War, owing to the fact that foreign, and especially English, institutions were so seriously crippled, and hence so little able to take care of the necessities of foreign trade. As a result, the United States enjoyed an unequalled opportunity for the development of its foreign banking system and business, but it never succeeded in gaining a strong foothold; and after the reaction of 1920-21 when foreign trade showed such extensive and serious net losses, there began a movement to disestablish foreign banks which, numerically speaking, went very much further than in any other country, while at the same time the serious losses, which had to be recognized and written off as a result of the shrinkage of prices, became very pronounced. This, taken in conjunction with the readjustment of foreign trade, was perhaps the most striking economic-financial development of the entire post-war period in the business and credit world. During the years 1921-28 the United States passed through a period of bank

# FINANCIAL STATISTICS OF PRINCIPAL FOREIGN COUNTRIES

ENGLAND  
(In millions of pounds)

	Dec. 1922	Apr. 1929
Bank of England:		
Gold and silver, coin and bullion	154	156.5
Bank notes in circulation <sup>a</sup>	104	857.3
Currency notes and certificates	301	...
Total deposits	133	112.4
Nine London clearing banks:		
Money at call and short notice	106	143
Discounts and advances	1,080	1,178
Investments	360	244
Total deposits	1,684	1,743
Total clearings	2,769	3,667
Government floating debt:		
Treasury bills	719	700
Temporary advances	222	37
Total floating debt	941	737

<sup>a</sup> Less notes in currency note account.

ITALY  
(In millions of lire)

	Nov. 1922	Apr. 1929
Banks of issue:		
Gold reserve	1,186	5,125
Total reserve	2,089	10,256
Loans and discounts	9,082	5,523
Note circulation for commerce	9,782	16,274
Note circulation for the state	8,075	...
Total deposits	2,638	2,144
Leading private banks: <sup>a</sup>		
Cash	781	1,163
Loans and discounts <sup>b</sup>	8,659	8,938
Due from correspondents	3,568	5,091

<sup>a</sup> Gold abroad, gold coin and bullion in Japan.

failure and bank amalgamation which greatly reduced the number of institutions.

**Banking, Prices, and Finance.** The problems of banking, prices, and finance had become unusually closely intertwined as a result of disturbance to revenue systems and to bank reserve holdings during the War and there was a disposition subsequent to the struggle to treat the whole situation as essentially a large problem of public concern in which a restoration to soundness could be brought about only through the direct invocation of government assistance coupled with legislation. It was generally admitted that permanent recovery from the effects of war finance and restoration of stability in currency would involve certain standardized and fairly definite elements. Conspicuous among these was the restoration of a budgetary balance designed to bring about freedom for the central banks from constant demands on the part of government short-term borrowing. At the same time the necessity of bringing about, so far as possible, a uniform condition of the monetary standard in all countries trading with one another was recognized. It was thought that this might not necessitate the actual redistribution of gold coin, opinions differing as to the advisability of such a step, pending the time of full restoration of commercial and economic soundness; but it did imply the restoration of currency and banking convertibility into foreign standards of recognized stability and strength and in so doing it rendered the international monetary problem practically a uniform matter subject only to variations of local attitude growing out of the varying amounts of specie that were held, the varying conditions of public debt, budgetary balance, and the like. Finally, it was recognized that in some way it would be necessary to bring about a scaling down or cancellation of international indebtedness on a fairly large scale, since without such cancellation, it would be practically impossible to develop a situation in which the various countries could meet their foreign obligations and provide the interest essential to keeping them alive. The process of carrying out these changes made considerable advance during the period after the War and by 1928 had resulted in the restoration of at least temporarily stable conditions throughout western Europe and in other parts of the world; but the equilibrium remained uncertain and the overhanging problem of German reparations had not been settled.

Not only budgets but international debt and exchange conditions, as well as the distribution of specie among the several countries, were thus (in 1928) still in a transitional condition in which the development of stability or a return of soundness must depend upon measures yet to be taken, some of them of an international nature.

**Bibliography.** The principal sources of information of war finance are contained in the financial reports of the various countries. For the United States, the reports of the Secretary of the Treasury and the annual reports of the Federal Reserve Board give the most complete and authentic information. The League of Nations has published a series of documents which deal at great length with public finances during the War. Volume IV is perhaps the most useful of these publications. The following works also are of service in this same connection:

Bogart's *Direct and Indirect Costs of the Great World War*; Anderson, *Effects of the War on Money, Credit, and Banking in France and the United States*; Gottlieb, L. R., *Financial Status of the Belligerents and Post-war Finance* (a series of four monographs issued by the Bankers' Statistics Corporation, New York, 1920-21); Benson, *State Credit and Banking during the War and After*; Seligman, *Currency Inflation and Public Debts* (Equitable Trust Company, New York, 1922); Hollander, *War Borrowing*. Fisk, *Inter-Ally Debts* (New York, 1924); *Reports of the National Monetary Commission* (Washington, 1910-II); *Reports of the Comptroller of the Currency*; Smith, *Trust Companies* (New York, 1928); Willis and Beekhart, *Foreign Banking Systems* (New York, 1929); Lawrence, *Stabilization of Prices* (New York, 1927); *Currencies After the War* (London, 1920); Cassel, *Money and Foreign Exchange after 1914* (London 1922); Schacht, *The Stabilization of the Mark* (London, 1927). See **TARIFF; TAXATION; AGRICULTURAL CREDIT**, etc.; also paragraphs on *Finance* in articles on countries.

**FINLAND.** Formerly a grand duchy of the Russian Empire, but since Dec. 9, 1917, an independent republic, situated in the northeastern part of Europe on the gulfs of Finland and Bothnia. Area, 149,608 square miles, of which 17,100 square miles are under water; population estimate of Dec. 31, 1927, 3,582,406, as against 3,364,807 in 1920. The 1920 count was a gain (for the same area) of 224,399 over the last decennial period, or 7.2 per cent. In 1927 the rural population numbered 2,962,000. Racially, in 1920 the population was divided into Finns, 88.7 per cent; Swedes, 11 per cent; Russians, 1 per cent; Germans, 0.8 per cent; Lapps, 0.5 per cent. The national church is Evangelical Lutheran, but liberty of conscience is guaranteed. At the end of 1926, there were 3,452,933 Lutherans, 60,071 Greek Catholics and Raskolnics, 655 Roman Catholics, 2178 Methodists, 3896 Baptists, and 1715 Jews. During 1916-20, inclusive, emigrants numbered 16,678 of whom 16,597 went to America. In 1926 emigrants numbered 6043. The principal towns, with their populations in 1910 and 1927, were: Helsingfors, the capital, 221,000 (1910, 147,218); Abo, 63,000 (1910, 49,691); Tammerfors, 53,000 (1910, 45,442); Viborg, 50,000 (1910, 27,508).

**Agriculture.** Of the total area of Finland, 5,293,000 acres were devoted to crops in 1926; 2,931,000 acres to permanent meadows and pasture; 15,000 acres to trees, shrubs, and bushes; and 76,672,000 acres were woods, forests, and uncultivated land. In 1927 there were 1,871,865 cattle, 417,723 swine, 1,368,173 sheep, 395,968 horses, and 70,000 reindeer. The following table gives comparative statistics on acreage and production for 1909-13 and 1927:

Crop	Area (thousands of acres)		Production (thousands of units—bushels except as indicated)	
	1909-1913	1927	1909-1913	1927
Wheat	8	39	136	813
Rye	589	568	10,478	11,468
Barley	278	274	4,804	5,576
Oats	999	1,095	24,752	37,113
Potatoes	182	172	16,716	22,947
Flax and hemp	...	14	4,244 <sup>a</sup>	...
Hay	...	2,163	1,066 <sup>b</sup>	2,998 <sup>b</sup>

<sup>a</sup> Unit, pound of fibre.

<sup>b</sup> Unit, metric ton.

The country's chief wealth is in its forests and its water power. The forests of pine, spruce, and birch cover more than half the country, and the state forests alone include 33 per cent of the country's area. These yield a considerable revenue. In 1913, wood and wood products (including pulp and paper) formed 75 per cent of the exports of the country. By 1921 these had increased to 79 per cent and in 1927, to 89.5 per cent. It is estimated that there is 1,800,000 horse power available in Finland's water courses, but these as yet have been tapped only slightly, as is indicated by the fact that only 220,000 horse power was in use in 1926.

**Mining.** Mineral resources are still inconsiderable for want of capital, copper ore, magnetite, iron, and pyrite being mined only in small quantities. In 1923 considerable deposits of kaolin, which were available for the manufacture of porcelain and paper, were discovered near Wartsila.

**Manufacturing.** During 1927 the Finnish manufacturing industry was more active than ever before, registering new peaks for production values. The gross value of production, estimated at \$284,800,000, was nearly 3 per cent higher than in 1926. The net value of production, \$132,300,000, was 4 per cent higher. In 1926 the total value of industrial production (\$275,566,000) included the following: Wood, \$71,154,000; paper, \$52,628,000; foodstuffs and tobacco, \$49,329,000; textiles, \$26,248,000. There were 149,367 workers engaged in industrial occupations, more than one-third being employed in the wood and lumber industry.

**Commerce.** Imports and exports for typical years (based on the American dollar) were:

Year	Imports	Exports
1913	\$ 96,600,000	\$ 78,100,000
1918	63,076,500	28,355,400
1920	125,051,000	100,911,100
1922	84,700,000	95,600,000
1923	128,010,000	117,070,000
1927	160,924,000	159,328,000

The year 1922 was the first in the annals of Finland to show an excess of exports (13 per cent). In 1913, the excess of imports had been 22 per cent while for pre-war years the import excess had ranged from 15 to 40 per cent. On the basis of 1913 prices, exports in 1922 were 93.4 per cent of those in 1913 and imports were 74.4 per cent of those in 1913. Nothing can indicate more plainly than these figures how rapidly Finland was approaching its normal status. Principal imports were in the order of value: Textiles; cereals; coffee, tea, sugar; metals; machinery; oils and fats. Principal exports in the order of value were: Timber; pulp and paper; animal products, mostly butter; hides and leather; animals; matches; gums, tar, etc. In 1913 the following countries figured in goods sent into Finland, in the order of importance: Germany, Russia, Great Britain, Denmark, Sweden, Holland, Belgium. The United States was fifteenth, with \$712. In 1927 the order was: Germany (32.6 per cent), United States (15.4), United Kingdom (14.2), and Sweden (8.2). In 1913 the following were countries of destination of Finnish exports, by order of value: Russia, Great Britain, Germany, France, Holland, Belgium, Sweden, Denmark. Nothing was reported for the United States. In 1927 the order was: Great Britain (40.4 per cent), Germany (15.7), Netherlands (9.0), Belgium (6.0), United States (5.4).

**Communications.** In 1911 there were 2332 miles of railway; in 1927 the mileage was 3161, all but 186 miles of which belonged to the state. In 1926 there were 2811 post offices, 8758 miles of telegraph, and 114,057 miles of telephone wires. In 1913, 11,901 vessels entered Finnish ports, with cargo of 1,668,000 tons, in ballast 2,028,000 tons; 11,937 vessels cleared, with cargo 3,374,000 tons, in ballast 255,000 tons. In 1926 a total of 7482 vessels entered, with cargo 1,767,000 tons, in ballast 2,256,000 tons; 7536 vessels cleared, with cargo 3,828,000 tons, in ballast 293,000 tons. In 1927 the Merchant Marine consisted of 342 vessels with a capacity of 241,355 gross tons. About 166,076 tons were steam and 75,279 tons were sailing vessels.

**Finance.** On Dec. 31, 1927, there were 1,514,407,000 marks of the Bank of Finland in circulation. In 1914 there were 141,724,000 marks or \$27,352,732. Revenues in 1914 totaled 169,692,000 marks (\$32,777,556); in 1921, 2,887,179,000 marks (\$44,260,000); in 1929, 4,206,200,000. Expenditures in 1914 were 185,987,000 (\$35,895,491); in 1921, 2,698,135,000 (\$51,887,211); in 1929, 4,232,300,000 (\$106,654,000). In 1914 the total debt was 171,186,038 marks (\$33,038,905). At the end of 1927, it was \$91,400,000, at current rates of exchange, including \$79,000,000 of foreign debt and \$12,400,000 of internal debt. On July 31, 1929, it was 29,255,076,500 marks, consisting of 2,579,961,000 foreign consolidated debt and 345,115,400 marks internal consolidated debt. On Jan. 1, 1926, the Finnish mark was stabilized at \$0.0252.

**Education.** In 1928 there were three universities, the Swedish University at Abo being opened in 1919 and the Finnish University at Abo in 1922. There was a total of 4120 students. For secondary education, there were in 1926, 116 lyceums, 65 middle schools, 51 high schools for the people, with a total student body of 47,388. There were in all (1926) 9277 elementary schools with 620,452 pupils. Besides, the educational system included schools for the teaching of navigation, commerce, arts and crafts, agriculture, forestry, etc. In 1926 there were 370 newspapers and reviews in Finnish, 91 in Swedish, 50 in Finnish and Swedish, and 5 in other languages.

**Defense.** The army and coast defense are recruited on the basis of universal service. In 1927 the effectives included 2080 officers and 26,205 men. An integral part of the defense is the voluntary Civic Protective Guards Organization, which in 1927 numbered about 100,000. By 1929 Finland had no battleships. The army and navy budget for 1928 amounted to 423,000,000 marks.

**History.** The World War brought Finland relief from the Russification policy which had been carried on with increasing intensity during the decade preceding the outbreak of hostilities. Although the Finns in 1914-17 received no new political liberties, industrial growth, especially in the making of war materials, was considerable. The cities thus grew affluent while the countryside declined. It could not be said that the Finns hoped ardently for a Russian victory, for enlistments were surprisingly few. Yet the Russian Revolution of March, 1917, was hailed with mixed feelings. The bourgeois classes feared the dominance of the workers, much increased in number as they were by the expansion of industry and impregnated with revolutionary ideas by accessions from Russia. One of the

first steps of the Kerensky government was to restore representative government to Finland. When the Diet met on Apr. 5, 1917, the Social Democrats were in control. Strikes, a threatened famine, and altercations with Russia induced by efforts of the radicals for the Finnish independence featured the year 1917.

In the new Diet, elected Oct. 2, 1917 a bourgeois bloc forced out the Social Democrats and issued a declaration of independence on December 5. The Bolshevik government assented, on Jan. 9, 1918, and Finland was recognized by Sweden, Norway, France, Spain, Denmark, and Germany. The following year was a tragic one. "White Guards" and "Red Guards" appeared and war broke out everywhere, beginning with the seizure of Helsingfors in January, 1918, by the "Red Guards," the establishment of a soldiers' and workers' council, and the inauguration of a Red Terror. The government appealed for aid to Sweden, which declined to interfere, and to Germany, which quickly responded by signing a treaty with Finland on Mar. 7, 1918, which practically made Finland a German vassal, and by sending troops under General von der Goltz to take the Red Forces in the rear. Victories by von der Goltz and General Mannerheim, leader of the "White Guards," immediately followed; Helsingfors was retaken; and by May, 1918, the revolution was crushed. The White Terror then inaugurated accounted for 15,000 to 20,000 victims, and almost 100,000 men and women were thrown into jail.

The German-controlled dictatorship of Senator Svinhufvud which followed attempted to erect a monarchy under a German prince, Frederick Charles of Hesse, but these and other plans were frustrated when the German Armies collapsed on the western front. In December, the pro-German, Svinhufvud, resigned and Mannerheim, whose sympathies were monarchistic, was installed as Regent. In 1919 he tried to bring Finland into the Murmansk campaign, but the country's interest was now entirely absorbed by internal problems. The Diet of Mar. 1, 1919, organized by a bloc of the Progressive-Agrarian parties (though the Social Democrats had a plurality), decided for a republic, and on July 25, Prof. Kaarlo Juho Stahberg was elected first President, over General Mannerheim, for a six-year term.

Finland was admitted to the League of Nations on Dec. 16, 1920. By the Treaty of Dorpat, Oct. 14, 1920, Finland received from Russia the Pechenga region on the Arctic Ocean which is especially desirable because the Gulf Stream keeps it open to winter navigation. Eastern Karelia, on the other hand, was granted autonomy under Russia. A dispute over a local uprising in Karelia in 1921 brought a state of ruffled feelings between Finland and Russia which lasted some years in spite of the efforts of the League of Nations to compose the differences. Another noteworthy controversy was that over the Åland Islands, claimed by Sweden on ethnological grounds and by Finland because of their strategic location at the entrance to the gulfs of Bothnia and Finland. The matter was referred to the League of Nations in June, 1920, and a year later the islands were granted to Finland. See ÅLAND ISLANDS.

Under the moderate Agrarian-Progressive coalition which continued in power after the election of 1922, the country made rapid strides toward regaining its stability and earned thereby the

approbation of European powers and the United States. In the latter part of 1923, however, a crisis was precipitated through the arrest of 23 Communist members of the Diet and the suppression of the Communist Party. On Jan. 16, 1924, the cabinet resigned and a new "cabinet of officials" was formed by Professor Cajander to act until elections could be held. Elections of April 1-2 reduced the Communist delegation from 27 to 18, with lesser changes in the other parties, the new representation being: Coalition Party, 38; Swedish People's Party, 23; Farmers' League, 44; National Progressives, 17; Social Democrats, 60; Communists, 18. On June 1, a bourgeois ministry was formed by Professor Lauri Ingman, and in November, the Cabinet was reconstructed with Professor Ingman remaining as Premier. In January, 1925, an Electoral College of 300 was elected to choose a new President of the Republic. It selected Dr. Lauri Kristian Relander, a conservative, giving him 172 votes, to 109 for the opposing candidate. He was inaugurated on March 1.

On January 16, a notable conference of the Foreign Ministers of Finland, Estonia, Poland, and Latvia met in Helsingfors for the discussion of problems of mutual concern. They agreed upon various cooperative policies relating to travel, commerce, etc., and upon a plan for obligatory arbitration of disputes arising among themselves. On an electoral reform issue, the ministry was forced out in March and was succeeded by a Coalition-Agrarian cabinet headed by Professor Antti Tulenheimo; but the new government lacked support and on December 10 it resigned. M. Kallio, leader of the Agrarians, became Prime Minister at the head of a cabinet of Agrarians and Coalitionists on the last day of the year. Without accomplishing any legislative measures of importance, the Government retained office for nearly a year, giving way in December, 1926, to a Socialist government, with Vaino Tanner as Premier, which was maintained in power by Progressive and Swedish support.

In April, by a close vote, it put through an amnesties measure to release political prisoners serving sentences for participating in the 1918 revolutionary movement. As the three-year life of the Diet came to a close in 1927, general elections were held in July, resulting in a gain of eight seats by the Agrarians and the loss of four by the Coalition Party and of seven by the Progressives. The new distribution was as follows: Social Democrats, 60; Swedish Party, 24; Coalition party, 34; Agrarians, 52; Progressives, 10; Communists, 20. The Socialist cabinet held office until December 9, when it resigned and was succeeded on December 17 by an Agrarian cabinet formed by Dr. Juho Sunila. Its span of life was likewise limited to one year, as a close non-confidence vote brought about its resignation Dec. 13, 1928. Dr. Oskari Mantere, of the National Progressive Party, became Premier, filling the cabinet positions with members of his own party and of the Coalition Party and with nonpartisans.

While this period was marked by few events of note, the various ministries wrestled continuously with the two major problems of Communism and prohibition enforcement. In February, 1928, the Finnish Diet tightened the prohibition laws by a series of amendments, and in April, wholesale arrests of Communists were made on charges of conspiracy. Most of the accused were later sentenced to varying terms in

prison. During 1928 an economic depression prevailed, due in part to overspeculation in industry and building. On Apr. 19, 1929, President Relander dissolved the Diet when it failed to support a government bill raising the salaries of government employees. Elections were set for July 1.

In foreign affairs, Finland for the most part enjoyed peaceful and harmonious relations with other nations. In 1924 treaties were signed with Norway and Italy relating to frontiers and trade, respectively, and in 1925 and 1926 trade and arbitration treaties were concluded with Norway, Sweden, Denmark, Hungary, Poland, Latvia, Spain, and the United States. On Sept. 15, 1927, Finland was elected to a non-permanent seat on the Council of the League of Nations.

**FINLAY, ROBERT BANNATYNE, FIRST VISCOUNT OF NAIRN (1842- )**. A British jurist, who was educated in medicine and law at Edinburgh Academy and University. He was a member of Parliament (1885-92, 1895-1906, 1910-16); Solicitor General (1895-1900); Lord Rector of Edinburgh University (1902-03); Attorney General (1900-06); Lord Chancellor (1916-18); British member of the Permanent Court of Arbitration at the Hague (1920- ); and a judge of the Permanent Court of International Justice (1921- ). He was created a knight in 1895, baron in 1910 and viscount in 1919.

**FINLEY, JOHN HUSTON (1863- )**. An American educator and editor (see VOL. VIII). He was a member of the American Army Educational Commission (1918), commander of the American Red Cross for Palestine and the Near East (1918-19), and resigned "as New York State Commissioner of Education in 1921 to become an editor of the New York Times. He served as chairman of the Committee on International Justice and Goodwill of the Federal Council of Churches of Christ in America, 1921-25. In 1923 he was appointed exchange lecturer to Scandinavian countries under the auspices of the Scandinavian-American Foundation. Among his later works are *French Schools in War Times* (1917), *A Pilgrim in Palestine* (1918), and *The Debt Eternal* (1923).

**FIORÉ, fyörä, PASQUALE (1837-1914)**. An Italian jurist (see VOL. VIII). *Il Diritto Civile Italiano Secondo la Dottrina e la Giurisprudenza* (2 vols., 1918), which he edited, was completed by Professor Biagio Brugi. *International Law Codified and its Legal Sanction* was translated into English in 1918, and new and revised editions of his more important earlier works were published after his death. Consult "Die Stellung des Menschen im Völkerrecht nach der Theorie Pasquale Fiores," in VOL. XIX of *Volksbildung*, by Josef Müller (1921).

**FIRE PROTECTION.** It is a somewhat striking commentary on the progress of civilization that, with the various means of safeguarding life and property, the losses due to fire in the United States and Canada have increased rather than diminished in the period after 1914, though beginning with 1926 some improvement in this respect is to be recorded. In fact, the annual destruction by fire and conflagration fairly could be compared with that of the World War (in 1927 alone it was estimated that some 10,000 lives were lost by fire), yet it has been impossible to arouse adequate public sentiment to deal effectively with this great menace. That this is necessary may be inferred from the fact

that 60 per cent of the fires in the United States are said to take place in homes and a majority of these unquestionably are due to carelessness. An annual property loss of nearly \$90,000,000 has been attributed to matches and smoking alone, a distinctly personal matter. However, along with improved building codes and inspection of premises both by municipal and outside agencies there were certain advances to be noted in securing more adequate fire protection, and there is a hopeful movement toward fire prevention which was becoming more general. A model arson law has been passed in a number of States and increased activity in securing convictions for arson was manifested.

In 1928 the fire loss as computed by the National Board of Fire Underwriters was the lowest since 1920. This was the first year since 1919 that the fire loss was not greater than in the year immediately preceding. From 1926 when the fire loss, the worst in the history of the United States, was estimated at \$561,980,751 or in excess of the San Francisco conflagration year of 1906 when it was \$518,611,800, the fire loss declined to \$478,245,620 in 1927, and \$472,224,568 in 1928. These figures represent the actual reported loss to which is added 25 per cent for unreported and uninsured damages and destruction. It was realized that much of the work of a municipal fire department should be in the field of fire protection and securing the enactment and enforcement of adequate regulations in the interests of public safety.

In 1928 the total estimated fire loss for the entire United States with a population of 120,013,000 was stated to be \$472,224,568, or a per capita of \$3.93, while for 445 cities with a population of 51,836,000, the total loss based on figures reported by fire departments was given as \$140,038,116 or a per-capita loss of \$2.70. While these statistics are only approximate, they may be compared with the record of the following cities: London, England, \$0.51 per capita; Edinburgh, Scotland, \$0.42 per capita; Bordeaux, France, \$0.75 per capita; Stuttgart, Germany, \$0.08 per capita; and Osaka, Japan, \$0.43 per capita. In 1928 there were 51 American cities in which the estimated loss, as reported by the Committee on Statistics and Origin of Fire of the National Board of Fire Underwriters, exceeded \$5 per capita, Fall River, Mass., heading the list with \$21.21 due to its conflagration of Feb. 2, 1928, followed by Freeport, Ill., with \$14.92.

The National Board of Fire Underwriters continue their inspection of municipal fire departments and water supplies, and from time to time have made valuable recommendations which were carried into effect and reacted to the benefit of the citizens by more favorable insurance rates. Since 1914 there has been the practical disappearance of horse-drawn fire apparatus in favor of motorized equipment which had reached a point where for speed and reliability, as well as for economy and capacity, it is able to function satisfactorily. By the elimination of the cost of maintenance for the food and care of the horses, it is possible to provide more adequate protection to the smaller cities and towns, and the increased speed of travel on the road and capability of achieving greater distances makes possible cooperative action by the fire departments of adjoining towns. In this connection, hose coupling, hydrant connections and other fittings have been made interchangeable conform-

ing to a common standard. In some of the larger cities, particularly those on the coasts, larger rivers, and the Great Lakes, independent high-pressure services were installed or extended and, with the tall buildings of modern construction, such independent high-pressure mains were considered absolutely essential.

In the fire departments themselves, it is interesting to note that along with the increase of technical interest and training (for example the Fire College of the New York Fire Department), there has been a marked advance in the spread of fire-prevention spirit and campaign. The old type of fire fighter whose method and pleasure apparently was the throwing of vast quantities of water seems to have passed. The reduction of the number of fire alarms rather than of the number of fires extinguished is beginning to mark the efficiency of a fire department and its chief, who is becoming both a public-conservation officer and an educator.

For the protection of water fronts, large and more powerful fire boats have been built with modern centrifugal and other pumps, and these are now valuable adjuncts to most of the large cities with warehouses, piers, and other harbor facilities, as their pumping facilities can be brought to bear also on fires not too far distant from the water front either through hose lines or permanent pipe systems. Not only on the Eastern coast of the United States but on the Pacific, such cities as Portland, Seattle, San Francisco, and Los Angeles have acquired large and powerful fire boats equipped with steam and gasoline engines and centrifugal pumps for fire protection on their shore fronts.

The seriousness of the annual fire loss has been appreciated by others than insurance authorities and municipal fire departments. The United States Chamber of Commerce through its Fire Waste Council has been cooperating with such agencies as the National Fire Protection Association and the National Board of Fire Underwriters. In 1928 there were nearly 700 chambers of commerce in the United States that were engaged in fire protection work and endeavoring to arouse the sentiment of their respective cities to the serious nature of the situation. Increased publicity was developed to this end and in many cities Fire Prevention Committees were organized and functioning in 1929. Clean-up and fire-prevention campaigns were being organized where civic pride as well as a proper appreciation of the fire hazard, was aroused. See INSURANCE: FORESTRY.

**FIRESTONE, HARVEY SAMUEL** (1868- ). An American rubber manufacturer, born in Columbiana Co., Ohio. He was president of a rubber company in Chicago while still in his twenties and in 1900 organized the Firestone Tire and Rubber Company at Akron, Ohio. That business developed rapidly with the growth of the automobile industry and within a few years established branches and subsidiary corporations in Canada and England. As president of the Rubber Association of America, Mr. Firestone organized its activities for the World War. In 1922 he campaigned against the British Crude Rubber Restriction Act. He investigated rubber-growing in the Philippines and in South America and has undertaken to develop twenty plantations for rubber production in Liberia, Africa, at an ultimate expenditure of \$100,000,000. He is the author of *Rubber—Its History and Development* (1922), and *Men and Rubber* (1926).

**FIRTH, SIR CHARLES HARDING** (1857- ). An English historian (see VOL. VIII). He was knighted in 1922 and became professor emeritus of modern history at Oxford in 1925.

**FISCHER, FISHER, EUGEN** (1881- ). A German writer, born at Balingen, Württemberg, and educated at the University of Tübingen. After the World War, he was made press secretary of the Reichstag commission inquiring into pre-war history. He wrote *Der Kampf um Gott, Das Reich des Lebens*, an historical novel; *Woodrow Wilsons Entschluss*, political scenes; and *Kriegsschuldfrage und Aussenpolitik* (1923).

**FISCHER, MARTIN HENRY** (1879- ). A German-American physiologist and pathologist, born at Kiel, Germany. He came to the United States in 1885 and took a degree at Rush Medical College. He became full professor in the University of Cincinnati in 1910. He was known especially for his original research into the nature of nephritis and was instrumental in bringing the subject of focal infection before the German medical men; he also translated into English a number of German works on physical chemistry. He published *The Physiology of Alimentation* (1907), *Edema* (1910), *Nephritis* (1911), and translated Cohen's *Physical Chemistry* (1903), Pauli's *Physical Chemistry* (1906), Ostwald's *Handbook of Colloidal Chemistry* (1915), and Ostwald's *Introduction to Colloidal Chemistry* (1917).

**FISH, CARL RUSSELL** (1876- ). An American historian, born at Central Falls, R. I., and educated at Brown and Harvard universities. In 1900 he became professor of history at the University of Wisconsin, and was research associate at the Carnegie Institution in 1908-09 and director of the British branch of Historical Service, 1917-20. His works include *Development of American Nationality* (1913), *American Diplomacy* (1915), *The Path of Empire* (1919), *Guide to the Study of American Diplomacy* (1919), *History of America* (1925), *Rise of the Common Man* (1928), and many articles on educational and historical subjects.

**FISHERBERG, MAURICE** (1872- ). A Russian-American physician and anthropologist, born at Kamenetz-Podolsk, Russia. He took his medical degree at New York University in 1897 and became clinical professor of medicine at the New York University and Bellevue Hospital Medical College and chief physician to the Montefiore Home and Bedford Sanitarium. In 1897 he made a tour of Europe for the Bureau of Emigration. He is one of the leading authorities on tuberculosis. His major publications are *The Jew: a Study of Race and Environment* (1911); *Die Rassenmerkmale der Juden* (1913), and *A Treatise on Tuberculosis* (1916). He translated Gley's work on internal secretions from the French in 1917.

**FISHER, THE RT. HON. ANDREW** (1862-1928). An Australian statesman (see VOL. VIII). He was again Prime Minister of Australia in 1914-15 and was High Commissioner of Australia in England, 1916-21.

**FISHER, DOROTHY CANFIELD** (1879- ). An American author, born at Lawrence, Kan., and educated at the Ohio State University and at Columbia University. In 1907 she married John Redwood Fisher of New York, and in 1911-12 she and her husband went to Rome, where she made the acquaintance of Madame Montessori and helped translate her book about her pedagogical system. From this experience resulted her

own book, *A Montessori Mother* (1913), which was translated into five foreign languages. During the World War, Mrs. Fisher engaged in war work in France for three years. Her books include *The Squirrel Cage* (1912); *Mothers and Children* (1914), *The Bent Twig* (1915), *Hillsboro People* (1916), *The Real Motive* (1917), *Understood Betsy* (1917), *Home Fires in France* (1918), *The Day of Glory* (1919), *The Brimming Cup* (1921), *Rough-Hewn* (1922), *Raw Material* (1923), *The Homemaker* (1924), *Made-to-Order Stories* (1925), *Her Son's Wife* (1926), and *Why Stop Learning?* (1927). She translated Papini's *Life of Christ* (1921).

**FISHER, FRÉDÉRIC BOHN** (1882- ). An American Methodist Episcopal bishop, born at Greencastle, Pa., and educated at Asbury College (Wilmore, Ky.), Boston University, and Harvard University. He was ordained in the Methodist ministry in 1903 and in the next year went to India as a missionary, returning in 1906. From 1908 to 1910 he was pastor of the First Church in Boston and in 1910-20, served on the Board of Foreign Missions and in the Laymen's Missionary Movement. In 1920 he was elected bishop. He is the author of *The Way to Win* (1915), *Gifts from the Desert* (1916), *India's Silent Revolution*, in collaboration with Gertrude M. Williams (1919), *Garments of Power* (1920), and *Which Road Shall We Take?* (1923).

**FISHER, THE RT. HON. HERBERT ALBERT LAUBENS** (1865- ). An English historian and educator (see Vol. VIII). He received honorary degrees from Cambridge (1920), and other universities. He was a member of the Royal Commission on the Public Services of India (1912-15), President of the Board of Education (1916-22), a member of Parliament for Sheffield (1916-18), and for the English Universities (1918-26), and a member of the British delegation to the League of Nations Assembly (1920-22). In 1920 he was made a Fellow of the Royal Society. In 1924 he gave the Lowell Lectures in Boston, Mass., which previously he delivered in 1909, and in the next year he became the Warden of New College, Oxford. He edited *The Modern World; a Survey of Historical Forces* in Baltimore (1920-27). His later works are *Studies in History and Politics* (1920); *International Experiment* (1921); *The Common Weal* (1924), the *Life of Lord Bryce* (1926), and *Sir Paul Vinogradoff; a Memoir* (1927).

**FISHER, IRVING** (1867- ). An American economist (see Vol. VIII). He was an officer of many organizations for the advancement of the public health. His later writings include *Why Is the Dollar Shrinking?* (1914); *How to Live*, with Dr. E. L. Fisk and others (1915); *Stabilizing the Dollar* (1919); *The Making of Index Numbers* (1922); *League or War?* (1923); *America's Interest in World Peace* (1924); *Prohibition at Its Worst* (1926); *Prohibition Still at Its Worst* (1928); and *The Money Illusion* (1928). His views on the means of insuring a stable medium of exchange were the subject of wide discussion.

**FISHER, LORD JOHN ARBUTHNOT** (1841-1920). A British admiral (see Vol. VIII). As First Sea Lord of the Admiralty during the first year of the World War, he supervised the reorganization and expansion of the British fleet and devised a plan for the invasion of the Baltic and the landing of an army within striking

distance of Berlin. He resigned in 1915 on the ground that the effort to force the Dardanelles was endangering the British margin of safety in the North Sea. In 1919 he published a volume, *Reminiscences*. He continued as Admiral of the Fleet until his death in London, July 10, 1920. He was buried in Westminster Abbey.

**FISHER, SYDNEY GEORGE** (1856-1927). An American lawyer and writer (see Vol. VIII). He wrote *American Education* (1917), *The Quaker Colonies* (1918), and many articles on nature study and out-of-door life.

**FISHER, WALTER KENRICK** (1878- ). An American zoölogist, born at Ossining, N. Y., and educated at Leland Stanford, Junior, University. He was special field naturalist for the United States Biological Survey (1897-1901); and assistant (1902-05), acting instructor (1905-07), instructor (1907-09), assistant professor (1909-20) associate professor (1920-25), and professor since 1925 at Stanford. Professor Fisher was director of the Hopkins Marine Laboratory (1917- ). His published work was largely on the echinoderms of the Pacific Ocean.

**FISHERIES.** A term of varied application but used here to designate organized governmental agencies which have to do with the collection of information concerning food supplies obtained from oceanic or inland waters and the application of this information to the problem of increasing or making these supplies more available to the citizens. In all countries where fishing industries are important, it has been the experience that there occur periods when there are noticeable decreases in the amount of these supplies to be obtained from the waters and this decrease is usually laid to injudicious fishing. As a result, a large part of the work of a fisheries bureau is to devise methods for increasing the supply, and legislation governing the methods to be employed in taking it.

In the United States, the Bureau of Fisheries (originally the United States Fish Commission but now a bureau under the Department of Commerce) has general supervision over the marine and fresh-water fisheries in United States territory as well as the fur seal, reindeer, and fox industries in Alaska. Under its control are four main laboratories; at Woods Hole, Mass.; Beaufort, N. C.; Key West, Fla.; and Fairport, Iowa. In all of these it has been the policy of the Bureau to encourage abstract scientific investigations, as well as researches having more immediate practical application. At the Woods Hole station formerly there were hatched each year large numbers of lobsters, which were set free in the neighboring waters; but as it seemed impossible to enlist the co-operation of the fishermen in the attempt to prevent the catching of the "short" or immature lobsters, the supply decreased so that it was difficult to get enough eggs for this work and it was discontinued in 1919.

Invention of machinery making commercially profitable the manufacture of buttons from the shells of fresh-water mussels led to the establishment of the laboratory at Fairport, where much attention has been given to the problem of the propagation of mussels and of the fishes upon which the young mussels are parasitic for a period during their immature stage, though in 1927-28 a technique was perfected for rearing

the larvæ in nutrient solutions and thus eliminate the parasite stage.

A large part of the work of the bureau consists of the collection of statistics relating to the fisheries (including the Alaska fur industries), and the reports of the commissioner, as well as the occasional *Statistical Bulletins*, should be consulted for this information, which is too varied and voluminous to be summarized here. These statistics cover not only data relating to fish properly so-called, but relate to a wide range of aquatic products covering oysters and clams, lobsters, shrimps and crabs, and sponges, as well as by-products such as whale and fish oil, shark and porpoise hides, agar-agar, shark fins, whale skeletons and oyster shells ground up for use as lime and poultry grits.

Much of the recent work of the bureau has been extended to cover determination of improved methods for merchandising fishery products, as well as the consideration of better preservation procedures in connection with canning and freezing, thus broadening the scope of its operations so as to include the final distribution of the products, as well as encouraging their increase.

In Alaska, the predominate fishery interests have been connected with the salmon, but halibut, herring, cod, and shrimps form an important part of the total catch. The taking of skins of the fur seals is now under strict supervision, it being decided annually how many should be taken. This has resulted in a desirable increase in the size of the herds and the establishment of the industry on a more durable basis.

According to the Report of the Commissioner for the year ending June 30, 1928, the United States (including Alaska) fisheries employ 118,600 commercial fishermen with 43,000 persons on transporting vessels, the value to the fishermen of annual landings of fisheries products being \$103,000,000. Seal skins to the value of \$721,152.50 and blue fox skins to the value of \$79,172.50, were sold during the year.

The *Conseil Permanent Internationale pour l'Exploration de la Mer* is a coöperative venture, composed of all European nations bordering on the North Sea. This was organized in 1901 and has continued since that time, though interrupted during the War. Their *Rapport Jubilee* published in 1927 gives an optimistic account of the work the *Conseil* has thus far accomplished, not only in increasing the value of the cod, herring, plaice, and eel fisheries, but in accumulating a large amount of hydrographic data as well. For details, the reports of the *Conseil* should be consulted.

**FISK, EUGENE LYMAN** (1867- ). An American physician and co-founder of the Life Extension Institute, born at Brooklyn, N. Y., and educated at the medical college of New York University. After serving as medical director of the Provident Savings Life Insurance Company and the Postal Life Insurance Company, he became the medical head of the Life Extension Institute in 1913. In collaboration (Fisher and Fiske) he wrote *How to Live* (1916) and *Health for Soldier and Sailor*. He is the author of *Alcohol: Its Relation to Efficiency and Longevity* (1917); *Health Building and Life Extension* (1923); and *How to Make the Periodic Health Examination* (1927).

**FISKE, BRADLEY ALLEN** (1854- ). An American naval officer, retired in 1916 (see Vol.

VIII). He was president of the U. S. Naval Institute (1911-23). He was awarded a gold medal by the Aero Club of America for the invention of the torpedoplane in 1919. His later writings include *The Navy as a Fighting Machine* (1917, 2d ed., 1918); *From Midshipman to Rear Admiral* (1919); *The Art of Fighting* (1920), and *Invention* (1921).

**FISKE, CHARLES** (1868- ). A Protestant Episcopal Bishop, born in New Brunswick, N. J., and graduated at St. Stephen's College, Annandale, N. Y. (A.B., 1893) and at the General Theological Seminary (B.D., 1896). Ordained in the Protestant Episcopal Church, he served parishes in New Jersey, Pennsylvania, and Baltimore, Md. In 1915 he was consecrated Bishop Coadjutor and in 1928 Bishop of Central New York. He is the author of *The Perils of Respectability*; *The Experiment of Faith*; *Back to Christ*; *The Faith by Which We Live*; *Sacrifice and Service*; *The Religion of the Incarnation*; *The Christ We Know*; and *Confessions of a Puzzled Parson*.

**FISKE, HALEY** (1852-1929). An American insurance official and expert, who was born at New Brunswick, N. J., and educated at Rutgers College (A.B., 1871). He studied law and was admitted to the bar in New York City, where he practiced until 1891. Becoming a vice president of the Metropolitan Life Insurance Company in that year, he was elected president in 1919 and remained at the head of the company until his death. He inaugurated various policies that developed his company as a social institution and an important agency in public-health campaigns throughout the country. He was a leading layman of the ritualistic wing of the Protestant Episcopal Church and a trustee of and liberal giver to the Cathedral of St. John the Divine and other church enterprises.

**FISK UNIVERSITY**. A coeducational institution for Negroes of Nashville, Tenn., founded in 1868. Dormitory limitations prevented much variation in attendance, which was 516 in 1914, and 503 in 1928-29, with an additional 82 in the music school. The faculty in 1928 numbered 35 members and there were 24 administrative officers and assistants. For its rigid emphasis on high standards in all departments, the University was aided during the period 1914 to 1928 by the General Education Board, the Carnegie Foundation, the Carnegie Corporation, the Phelps-Stokes Fund, the Slater Fund, the American Missionary Association, the Harmon Foundation, and the Juillard Musical Foundation. Fisk received, chiefly from the General Education Board and the Carnegie Corporation, the sum of \$150,000 in 1917; and in 1920 the General Education Board offered \$500,000 on condition that the University raise \$1,000,000. Thomas Elsa Jones, Ph.D., was inaugurated as president in 1926, at ceremonies attended by representatives of numerous leading educational institutions, among whom were President James R. Angell of Yale, who delivered the principal address, and Chancellor Kirkland, of Vanderbilt University.

**FITCH, ALBERT PARKER** (1877- ). An American educator, born in Boston, and educated at Harvard University and Union Theological Seminary. He was ordained in the Congregational ministry in 1903, subsequently holding various pastorates, and becoming president of Andover Theological Seminary at Cambridge in 1909. In 1917 he resigned to accept the profes-

sorship of the history of religion at Amherst College, where he was one of those who withdrew from the faculty on the resignation of President Meiklejohn in 1923. He held a professorship at Carleton College, Northfield, Minn., 1924-27, and since 1929 has been minister of the Park Ave. Presbyterian Church, New York City. He is the author of *The College Course and the Preparation for Life* (1914), *Religion and the Undergraduate, Can the Church Survive the Changing Order?* (1920), and *Preaching and Paganism* (1920).

**FITE, WILLIAM BENJAMIN** (1869- ). An American educator, born in Marion, Ohio. He studied at Hilldale College and took postgraduate work at Cornell. After teaching mathematics in the Academy, he served on the faculty of Cornell as instructor and assistant professor in mathematics until 1910, when he was appointed professor of mathematics at Columbia. He wrote *College Algebra* and *First and Second Courses in Algebra*.

**FITZGERALD, FRANCIS SCOTT** (KEY) (1890- ). An American author, born at St. Paul, Minn. He left Princeton University in 1917 to join the American forces in the World War and served as aide-de-camp to Brig. Gen. John F. O'Ryan (1918-19). Written with refreshing verve and promising talent, his books on the younger generation include *This Side of Paradise* (1920), *Flappers and Philosophers* (1920), *The Beautiful and the Damned* (1921), *Tales of the Jazz Age* (1922), *The Great Gatsby* (1925), *All the Sad Young Men* (1926), and a play, *The Vegetable* (1923).

**FITZGERALD, JOHN DRISCOLL II.** (1873- ). An American philologist and publicist (see VOL. VIII). He was professor of Spanish at the University of Illinois from 1915 to 1925, when he became professor of Romance philology there. In 1922-23 he was visiting professor at the University of Madrid and the Centro de Estudios Históricos. He has been editor of *The Hispanic Series* since 1916, and consulting editor of *Hispania* since 1919. Among his recent publications are a translation (with Thacher Howland Guild) of *A New Drama*, by Manuel Tamayo y Baus (New York, 1915); *Apuntes sobre Literatura Americana* (Madrid, 1924); and *Relaciones Hispano-Americanas* (Madrid, 1925).

**FITZMAURICE-KELLY, JAMES** (1857-1923). An English writer and Spanish scholar (see VOL. VIII). He was professor of Spanish language and literature at the University of Liverpool (1909-16), and at the University of London (1916-23). Among his later works are *Cervantes and Shakespeare* (1916); *Góngora* (1918); *Fray Luis de León* (1921); and *Spanish Literature Primer* (1922). He edited the Romance section of the *Modern Language Review* (1913-20), *Samaniego's Fábulas en verso* (1917), *Iriarte's Fábulas Literarias* (1917), *Garcilaso de la Vega's Eglogas* (1918), *Poesías varias* (1918), *Complete Works of Miguel de Cervantes Saavedra*, and *Cambridge Readings in Spanish Literature* (1920). He also contributed to the *Cambridge Modern History*.

**FITZPATRICK, EDWARD AUGUSTUS** (1884- ). American educator and author, born in New York, and educated at the New York Training School for Teachers and Columbia University. He taught in New York and in 1919 he became secretary of the State Board of Education in Wisconsin. He conducted a seminar on public

educational administration at the University of Wisconsin 1919-23. Since 1924 he has been dean of the graduate school of Marquette University, Milwaukee, Wis., and editor of *Hospital Progress*. He has published *Educational Views and Influence of De Witt Clinton* (1911), *Budget-making in a Democracy* (1918), "Public Administration and the Public Welfare" in *Freedman's America and the New Era* (1920), *The Scholarship of Teachers in Secondary Schools* (1927), *Industrial Citizenship* (1927), *Wisconsin* (1927).

**FITZROY, RT. HON. EDWARD ALGERNON** (1869- ). An English soldier and member of Parliament, son of Baron Southampton. He was educated at Eton and Sandhurst, and attained to the rank of captain in the army. Although nearly fifty, he served throughout the World War, being wounded at the first battle of Ypres. His political career began in 1900 when he entered Parliament as a Conservative. He has since served continuously except for the years, 1906-10. In 1922 he became deputy chairman of committees and in 1924, Privy Councillor. In June, 1928 he was elected Speaker of the House of Commons.

**FIUME-ADRIATIC CONTROVERSY.** The drawing of the boundary line between Italy and Yugoslavia was perhaps the most difficult problem before the Peace Conference in 1919, and continued to be a cause for dissension in Europe long after the peace treaties were signed. The territories in dispute were: Gorizia and Gradisca, Trieste, Istria, Dalmatia (all former parts of Austria), and Fiume (formerly belonging to Hungary). These lands, in the main, are separated from Yugoslavia by chains of mountains; in climate, economic, and cultural activities, with some exceptions, their orientation is plainly toward the West. While the Slavs made up the majority of the population, the Italians predominated in many of the towns and it was for sentimental, historical, and strategic, as well as economic, reasons that Italian aspirations envisaged the acquisition of these territories. By the secret Treaty of London (Apr. 26, 1915), Italy gained the promise of Allied support to an Italian frontier which included Gorizia, Trieste, Istria, Northern Dalmatia, and some islands to the south; Fiume was to remain in Croatia, on the supposition, evidently, that it was to continue to form a part of Hungary. On Oct. 29, 1918, Italian troops, at the behest of the Fiumani, occupied the town. The Allies, in their turn, protested on the ground that Fiume had not been assigned to Italy, with the result that an inter-Allied army took possession. The course of events before the Peace Conference was characterized by a bitter struggle that terminated in a deadlock. The Italians took their stand on the Treaty of London line, claiming Fiume as well on the ground that the dissolution of the Austro-Hungarian Monarchy had entirely changed the situation. The Yugoslavs found a champion in President Wilson, who stubbornly contested the Italian claims on the eastern boundary and supported a frontier which ran on the north along the London line to Tarvis and then dipped south along the centre of the Istrian peninsula. Fiume was to be internationalized though left within the Yugoslav customs union. (This was the well-known "Wilson Line" presented Apr. 14, 1919.) That the Italians should be embittered was natural: they had entered the War largely as a result of the Treaty of London; they had the support

of their allies in their claims; they demanded the territories for important strategic and cultural reasons. The failure to reach a compromise prompted President Wilson to issue his famous appeal of April 23 to the Italian people over the heads of their delegation. (See PEACE CONFERENCE AND TREATIES.) But the statement acted as a boomerang, for instead of winning over the Italian people, it completely estranged them, with the result that Orlando's government, on June 19, was defeated in the Italian Parliament. All chances for a settlement, at least as far as the Peace Conference was concerned, had thus disappeared. It was no wonder, therefore, that when on September 12 the poet-militarist D'Annunzio, at the head of a band of volunteers and Italian regulars, marched into Fiume, his *coup de main* should be received with such exuberant Italian approval. The Supreme Council was spurred into action and during the next few months concerned itself with various programmes. The scheme proposed on Dec. 9, 1919, called for the creation of a Fiume buffer state (for by this time Italy had dropped Dalmatia), which Italy, however, refused to support; a subsequent combined Italian-English-French proposal, Jan. 14, 1920, called for the assignment of Fiume to Italy with League control of its port and terminal connections, but to this both Jugoslavs and Wilson objected. Thenceforth, the struggle became localized, and with the withdrawal of the United States from world affairs, the declining interest of Great Britain and France in the Adriatic, and the imminent defeat of the Democratic Party in the American elections of 1920, it appeared evident to both disputants that only a spirit of conciliation would serve their best interests. In June, 1920, the Italians finally evacuated their last strongholds in Montenegro and Southern Dalmatia. On November 12, a treaty was signed by Italy and Yugoslavia at Rapallo which showed how much both had yielded. Italy was to annex part of Carniola and all Istria and push her frontier east to the confines of Fiume; Fiume was to be created an independent state, though Sušak was to go to Yugoslavia; Italian claims to Dalmatia (except Zara) and almost all the islands (excepting Cherso, Lussino, and Unie) were renounced. Ratifications were exchanged Feb. 2, 1921, and the vexing business seemed on the verge of settlement when it leaked out that the Italian government privately had promised to turn over Porto Barros, a portion of the Fiume port, to Yugoslavia. Again the Italian public was aroused and again Fiume became the bone of contention. Meanwhile, the D'Annunzio tangle had been straightened out. In December, he was ordered by the Italian government to evacuate the town, and on his refusal to do so, the signal was given to attack (December 24). Realizing the hopeless nature of his position, four days later he handed over his powers to the town council, and by Jan. 2, 1921, the Italian regulars were in control. D'Annunzio was ejected and steps were taken to establish the independent government provided for by the Treaty of Rapallo. Elections were held in April, 1921, for a Constituent Assembly, but the Italian Nationalists, being defeated, destroyed the returns, and violence again prevailed. The Fascisti, who had organized themselves in sympathy with Italian Fascism (see ITALY), seized the city government and established a Fascist Directory. Difficulties engendered in

Italian evacuation of the Northern Dalmatian zone necessitated the negotiation of the supplementary convention of Santa Margherita (October, 1922) between Italy and Yugoslavia, though even this did not much expedite matters, in particular as far as Fiume was concerned. In November, 1922, the Fascist government came into power in Italy and Mussolini at once indicated that it was his intention to hasten a settlement. Independent local government in Fiume had proved itself a failure, though this may have been due to the interference of the Fascisti; economic life also was completely disorganized. In 1923 Mussolini exchanged a series of notes with the Yugoslav government relative to the status of the disputed city. As his demands for revision of the Rapallo Treaty and assignment of Fiume to Italy were made in the peremptory style in which he had been accustomed to address the Italian Parliament, rather than with diplomatic suavity, the negotiations became increasingly acrimonious. When an Italian military force under General Giardino seized the city, a rupture of diplomatic relations and perhaps even graver consequences seemed imminent, but secret bargaining between Belgrade and Rome ultimately averted armed conflict. In January, 1924, it was announced that an agreement had been reached. The treaty, signed at Rome, three days later, ceded the city and port of Fiume to Italy, recognized Yugoslav sovereignty over Porto Barros, leased to Yugoslavia a port in the Fiume Harbor, and made the Fiume railway station an international frontier station. Additional conventions signed at the same time recognized Yugoslav sovereignty over Dalmatia and Italian sovereignty over Venetia Julia. See PEACE CONFERENCE.

**FIVE-POWER NAVAL TREATY.** See WASHINGTON CONFERENCE, and NAVIES OF THE WORLD.

**FIXATION OF NITROGEN.** See CHEMISTRY, and FERTILIZERS.

**FLAMMARION,** flá'má'ré'ón', CAMILLE (1842-1925). A French astronomer (see VOL. VIII). Among his later writings were *Death and Its Mystery*, in three parts (1920, 1921, 1922), *Dreams of an Astronomer* (1923), and *Haunted Houses* (1924).

**FLANAGAN, JOHN** (1865- ). An American sculptor (see VOL. VIII). Although his work included such sculptures as the bronze memorial portrait of Samuel Pierpont Langley, Smithsonian Institution, and the Bulkley Memorial, Aetna Life Insurance Building, Hartford, he was active chiefly as a medalist, especially during the World War. He executed the "Médaille de Verdun," voted by Congress and presented to that city by President Harding. The fine realism of his portraiture and his subtle handling of lights and shadows made him preëminent in low relief. He won the Saltus Medal of the American Numismatic Society in 1921.

**FLANDERS, BATTLES IN.** See WORLD WAR, under *Western Front*.

**FLEG, EDMOND** (1874- ). A French writer. His works include the plays *Le Message* (1905); *Le Cloison* (1906); *Le Trouble-fête* (1913); *La Maison du Bon Dieu* (1920); and *Le Juif du Pape* (1925); the poems *Le Mur des pleureurs* and *Le Psaume de la terre promise* (1919); *Ecoute, Israël* (1921), and *Anthologie juive*, from early days to the present (2 vols., 1923; trans. 1925); a French translation of the Hebrew text of *Haggada de Pessah* (1925);

*L'Enfant prophète*, fiction (3d ed., 1926), and *La Vie de Moïse* (1928; trans. as *The Life of Moses*, 1928). He edited *Judaïsme*, seven volumes appearing between 1925 and 1927.

**FLEMING, DANIEL JOHNSON** (1877- ). An American clergyman, born at Xenia, Ohio, and educated at Wooster University, Union Theological Seminary, and Columbia, Chicago, and Punjab universities. He was ordained in the Presbyterian ministry in 1903 and went to India in 1904 as professor of physics and director of Forman Christian College at Lahore. He remained there until 1913. In 1915 he was appointed organizing director of the department of foreign service at Union Theological Seminary, and in 1918, professor of missions. In 1919-20 he was a member of the International Commission on Indian Village Education. He is the author of *Social Study, Service, and Exhibits* (1913), *Devolution in Mission Administration* (1916), and *Marks of a World Christian* (1919). He collaborated in *Village Education in India* (1920), *Schools with a Message in India* (1921), *Building with India* (1922), *Contacts with Non-Christian Culture* (1923), and *Whither Bound in Missions* (1925).

**FLEMING, JOHN ADAM** (1877- ). An American magnetician, born in Cincinnati, Ohio. He graduated from the University of Cincinnati, 1899; from that year to 1910, was with the United States Coast and Geodetic Survey. He was chief magnetician of the Department of Terrestrial Magnetism at the Carnegie Institution (1904- ), chief of the Magnetic Survey Division, 1919-21, and assistant director since 1922. He wrote reports on terrestrial magnetism and other subjects for the Carnegie Institution and also contributed numerous articles to reviews and magazines.

**FLEMING, JOHN AMBROSE** (1849- ). A British electrical engineer (see VOL. VIII). He was professor of electrical engineering in University College, London (1885-1926). He invented the thermionic valve, revolutionizing wireless telegraphy, and was associated with the development of wireless telephony and other electrical inventions. His work earned for him the Albert Medal of the Royal Society of Arts (1921) and the Faraday Medal of the Institution of Electrical Engineers (1928). Among his later publications are *Fifty Years of Electricity* (1921); *Electrons, Electric Waves, and Wireless Telegraphy* (1923), and *The Interaction of Scientific Research and Electrical Engineering* (1927).

**FLEMING, WALTER LYNNWOOD** (1874- ). An American historian, born at Brundidge, Ala., and educated at the Alabama Polytechnic Institute and Columbia University. From 1903 to 1907, he was professor of history in West Virginia University, and from 1907 to 1917, in Louisiana State University. In the latter year, he was called to a similar position at Vanderbilt University in Nashville, Tenn., where he has been dean of the College of Arts and Science since 1923. He was one of the editors of the *Historians' History of the World* and edited Lester and Wilson's *History of the Ku Klux Klan* (1905), *Documentary History of the Reconstruction*, 2 vols. (1906, 1907), section six of *The South in the Building of the Nation*, 12 vols., and the *Mississippi Valley Historical Review*. He is the author of *Reconstruction of the Seceded States* (1905), *The Civil War and Reconstruction in Alabama* (1905), *William Tecumseh Sherman*

as *College President* (1912), *The Sequel of Apomattox* (1919), and *The Freedmen's Savings Bank* (1927).

**FLEMISH MOVEMENT.** See BELGIUM.

**FLERS, flâr, ROBERT DE LA MOTTE-ANGO, MARQUIS DE** (1872-1927). A French dramatist, born at Pont l'Évêque, and educated at the Lycée Condorcet in Paris, who devoted himself to drama both as author and critic. Among his theatrical works, which earned him a place in the French Academy (1920), the undisputed masterpiece was *Le Roi*, who was Edward VII of Great Britain, written with Caillavet and Arène. It combined the breeziness of a revue and the biting satire of Beaumarchais. His theatrical works written with Caillavet include *Le cœur a ses raisons; Les sentiers de la vertu; L'ange du foyer; Miquette et sa mère; La chance du mari; L'Amour veille; L'éventail; Le bois sacré; L'Ane de buridan; Papa; Primerose; L'Habit vert, and Monsieur Bretonneau*. With Etienne Rey, he wrote *La Belle Aventure*, and Caillavet collaborated with Flers in writing the operettas, *Les travaux d'Hercule; Le Sire de Vergy; Monsieur de la Palisse; Paris, ou le Bon Juge; Fortunio; Béatrice, and Ciboulette*, the music for them being by Claude Terrasse, André Messager, or Reynaldo Hahn. With Francis de Croisset, he wrote *Les nouveaux messieurs, Le retour, Les vignes du seigneur, and Le docteur miracle*. *L'Amour veille* and *Primerose* received the Toirac Prize of the French Academy. Among his critical and fictional works may be mentioned *Vers l'Orient*, crowned by the French Academy; *Entre cœur et chair; Essais de critique; Histoire de la Courtisane Tain, and La petite table*.

**FLESCH, CARL** (1873- ). An eminent Hungarian violinist (see VOL. VIII). In 1924 he was appointed head of the violin department of the Curtis Institute in Philadelphia, and the following year founded the Curtis String Quartet (with E. Zetlin, L. Bailly, and F. Salmon). Dividing his time between the United States and Germany, he accepted, in 1928, the post as head of the violin department at the Staatliche Hochschule für Musik in Berlin. He edited Kreutzer's and Paganini's studies, Mozart's violin sonatas and the concertos of Beethoven, Mendelssohn, Paganini, and Brahms, and wrote an excellent method: *Die Kunst des Violinspiels* (2 vols., 1923 and 1928).

**FLETCHER, DUNCAN UPSHAW** (1859- ). A United States Senator (see VOL. VIII). He was reelected to the Senate from Florida for the three terms, 1915-33. In that period, he was a member of the Senate Committees on Commerce and Banking and Currency and of the Joint Committee on Printing. He was also chairman of the U. S. Commission on Rural Credits.

**FLETCHER, FRANK FRIDAY** (1855-1928). An American naval officer (see VOL. VIII). He was promoted to the rank of admiral in March, 1915. He was a member of the War Industries Board in 1917 and the General Board of the Navy, and was awarded a medal of honor for distinguished conduct in battle. In 1925 he was made a member of the President's Air Craft Board.

**FLETCHER, HENRY PRATHER** (1873- ). An American diplomat, born at Greencastle, Pa., and educated at Chambersburg (Pa.) Academy. He was admitted to the bar in 1894 and served with the "Rough Riders" in the Spanish-American War. His diplomatic career

began in 1902 when he was secretary of the American Legation in Cuba. After diplomatic service in China, Portugal, Mexico, and South America, he resigned in 1920, and was under-Secretary of State from Mar. 8, 1921, to Mar. 6, 1922. On the latter date, he accepted the post of Ambassador to Belgium. He headed the United States delegation to the Fifth Pan-American Congress at Santiago, Chile, in 1923, and was a delegate to the Sixth Congress at Havana, Cuba, in 1928. From 1924 to August, 1929, he was Ambassador to Italy, resigning in the latter year. He was principal advisor to President Hoover on the latter's pre-inauguration tour of Latin-America in 1928-29.

**FLETCHER, JOHN GOULD** (1886- ). An American author born at Little Rock, Ark., and educated at Phillips Academy (Andover, Mass.) and Harvard. He later made England his home. He has written *Fire and Wine* (1913), *Irradiations—Sand and Spray* (1915), *Goblins and Pagodas* (1916), *Japanese Prints* (1918), *The Tree of Life* (1918), *Breakers and Granite* (1921), and *Paul Gauguin, His Life and Art* (1921), *Preludes and Symphonies* (1922), *Parables* (1925), *Branches of Adam* (1926), *John Smith* (1928), *The Black Rock and Other Poems* (1928). He was one of the first to essay free verse successfully and together with Amy Lowell was considered as leading the so-called Imagist school of modern poetry.

**FLEWELLING, RALPH TYLER** (1871- ). An American professor of philosophy, born at De Witt, Mich., and educated at the University of Michigan, Alma College (Mich.), the Garrett Biblical Institute (Evanston, Ill.), and Boston University. He was ordained in the Methodist Episcopal ministry in 1896, holding pastorates from 1903 to 1917, and in the latter year becoming professor and head of the department of philosophy in the University of Southern California. In 1918 he was at the Sorbonne, Paris, and was appointed head of the department of philosophy at the American Expeditionary Force University at Beaune, France. He is the author of *Christ and the Dramas of Doubt* (1913), *Personalism and the Problems of Philosophy* (1915), *Philosophy and the War* (1918), *Bergson and Personal Realism* (1919), *The Reason in Faith* (1924), and *Creative Personality* (1926). He also contributed to the *Hastings Encyclopedia of Religion and Ethics* (1917), and founded and edited *The Personalist* (1920).

**FLEXNER, SIMON** (1863- ). An American bacteriologist and pathologist (see Vol. VIII). In the World War, he was chairman of the medical advisory committee of the American Red Cross and served as instructor of army medical officers at the Rockefeller Institute. Under his direction, the work of the laboratories of the Rockefeller Institute for Medical Research was increasingly important. After the War, a fully equipped hospital was added to the Institute where research upon specific diseases is carried on. Dr. Flexner extended his studies to include poliomyelitis, encephalitis, and experimental epidemiology.

**FLIGHT.** See **AERONAUTICS.**

**FLINT.** A manufacturing city of Michigan. Its population increased from 38,550 in 1910 to 91,599 in 1920 and to 148,800 in 1928, by estimate of the Bureau of the Census. This rapid expansion has necessitated wholesale building operations and extensive public improvements. In 1916 a civic building association built 3000

houses and in 1918 as many more; in 1927, 2953 houses were constructed. In 1920 an elaborate programme for civic improvements, costing \$2,215,000, was entered upon by the city. In 1924 these expenditures amounted to \$13,325,000 for streets, sewers, schools, and parks, and to \$10,800,000 for public-service facilities. The value of building permits issued in 1927 amounted to \$22,087,451. Four grade schools and a high school were completed the same year. The assessed valuation of property in 1927 was \$164,170,000; the net indebtedness was \$18,076,000. Flint is an important automobile manufacturing centre, being the home of the Buick Motor Company, Chevrolet Motor Company, A C Spark Plug Company, Marvel Carburetor Company, and the Fisher Body Corporation. About 50,000 persons were employed in these industries in 1928.

**FLOATING DOCKS.** See **DOCKS.**

**FLOODS AND FLOOD PROTECTION.** The years immediately following the World War were responsible for increased attention in many parts of the world to the great problems involved in reducing the damage and danger from floods caused by the overflow of rivers and sudden freshets. In China, this problem has always been a pressing one, but as damage by flood always had been considered inevitable, but slight effort had been made to reduce the hazards by engineering plans and construction. In France, the overflowing of the Seine and other rivers has brought temporary inconvenience and damage, and in 1910 after the City of Paris had experienced severe floods due to the rise of the Seine, a careful investigation was made of the best methods of protecting the city from the flood danger. By 1917 a comprehensive report dealing with this subject had been prepared and officially accepted, and from that time on various measures were taken to construct suitable protection works.

In the United States, the spring floods had often brought about vast inundations of farming and other lands, while the sudden rise of waters had produced great damage and loss of life in not a few instances. In addition to the usual spring floods, there were numerous cases where a cloudburst or protracted rain had developed swollen streams which had overflowed their banks, and in many cases had carried away bridges, dams, and other works.

In this latter connection, great danger has been increased, as where towns have been located on river banks they have often encroached upon the channel of the stream, and while the waterway would be ample in ordinary seasons, yet at time of flood it would be too restricted to accommodate the suddenly increased flow. Furthermore, by the construction of bridges the channel often was seriously reduced by the piers and abutments, so that not only were these structures damaged, or at times entirely carried away, but the water was backed up with manifest injury when it overflowed the banks, particularly where cities or villages were located in proximity.

The great flood of 1913 in the United States along the Mississippi and its tributaries resulted in one of the most interesting and important flood-control works ever constructed. This flood was particularly destructive in the valley of the Great Miami and its principal tributaries, the Mad and the Stillwater rivers in southwestern Ohio. Some 360 lives were lost, there was property damage of over \$100,000,000, and the esti-

mated depreciation in real estate values due to flood risks was over \$70,000,000. By 1915, that is, within two years, the principal cities affected, Dayton being the largest, had organized the Miami Conservancy District, had agreed to the apportionment of costs, and works were planned which, completed in 1922, remove forever the flood hazard in this area.

As this plan was worked out, it became clear that the necessary protection for a flood 40 per cent in excess of that of 1913, which was adopted as the "flood plan," might possibly be secured either by retention reservoirs or by channel improvements. By means of large reservoirs having dams with sluice ways, or outlets, of a fixed size, it would be possible to store up a sufficient quantity of water during the peak of the flood so as to reduce the maximum flow through the outlets to a rate which could be safely handled by the river channel below. On the other hand, by the improvement of the river channel alone, removing obstructions, eliminating bends and the many encroachments of man, and by improving the carrying capacity of the channel by lining, etc., it would be possible to pass great floods without damage. The economical plan, however, was a combination of these two methods, a problem involving some interesting analysis of engineering economics, and both reservoirs and channel improvements were provided.

Retarding basins or reservoirs were built as follows: the Taylorsville on the Miami River, the Huffman basin on the Mad River, and the Englewood basin on the Stillwater River. Further upon the Miami was the Lockington reservoir while on Tivin Creek emptying into the Miami below the city of Dayton, the Germantown retarding basin was built. Each of these reservoirs or basins was formed by a large earthen dike or dam pierced by conduits through which the water passed normally, but which at times of flood temporarily restrained the extra water, discharging it gradually at the capacity of the channel which by straightening and levees was increased. In addition to the construction of dams and channels, extensive changes of location of railways and roads were also involved. The total cost was about \$40,000,000.

The protective works of the Miami Conservancy District experienced their first serious test in the flood following the rainfall of Mar. 27-28, 1924. Water was stored back of all the dams to the following depths above the conduit floors: Germantown, 41.6 feet, Englewood, 40.6 feet; Lockington, 27 feet; Taylorsville, 23 feet; and Huffman, 22 feet. Conduits ran full at all dams except Huffman. Maximum discharges at the dams were as follows: Germantown, 6650 second-feet; Englewood, 8400 second-feet; Lockington, 5350 second-feet; Taylorsville, 23,000 second-feet; and Huffman, 13,000 second-feet.

In addition to the dams, the improved channels, which were an important part of the project, received a test when gauge heights of 12.3 and 13 feet were reached at Dayton and Hamilton, respectively. At the former point, the maximum discharge was 36,000 second-feet, while at Hamilton, it was 42,000 second-feet. The flood handled, while in no way approaching the actual capacity of the system, demonstrated the ability of the flood-control works to meet any emergency. It was estimated that without the protective measures, the gauge height at Dayton would have been five or six feet higher, as under previous conditions, and while it would not

have caused much serious trouble, yet it would have developed considerable alarm among the low-lying sections which was no longer felt.

In many cases, it has been extremely difficult to arouse public sentiment to the necessity for flood protection works. Floods, of course, are of infrequent occurrence and appear to be soon forgotten, while protection works are very costly. In recent years, however, great floods have occurred with startling regularity—the Mississippi disaster in 1927 and the Vermont flood in the fall of the same year—and have focused public attention on the flood problem.

**The Mississippi Flood Problem.** The plan followed in the Mississippi Valley has been to confine the great river to a comparatively narrow channel, so as to provide depths necessary for navigation, by levees, or earthen embankments. Millions have been spent in building up the levee system. On several previous occasions, the levees have been almost overtopped, or have actually failed in part, but in general they have been successful in confining the flood waters within the established channels and thus preventing extensive inundation. The great flood of 1927 proved, however, that the present levee system would not afford adequate protection from the higher floods. The flood channel provided was inadequate to carry off this record flow, some twenty major crevasses or breaks in the levees occurred, and many square miles were inundated.

The problem of proper flood control on the Mississippi is complicated by the fact that an adequate flood channel would not only be too wide to give navigation depths with normal river flow but would also require the sacrifice of the rich lower river lands which in many cases have been cultivated right up to the back of the levees. Thus, widening the river channel to peak load capacity is out of the question financially, due to the fact that to move the levees back a few miles would involve taking the most valuable river lands and would also require great and costly works. Such a plan would leave normal flow to clog with silt and deposit a channel which would be seldom full. Storage reservoirs may offer a means of reducing the peak-flood discharge of some of the five tributaries of the great river, but all plans so far proposed are based on providing what might be termed flood relief channels outside the present channel as defined by existing banks or levees. In this way, normal floods will be kept within present channel lines while floods requiring additional channel section will be spilled into relief channels. The need for careful studies to determine flood possibilities from various combinations of floods from the tributaries of the river, economic considerations as regards the conditions in the various territories to be benefited and the selection of locations so as to conserve the areas of greatest economic value make the problem very complicated, and in addition there is always present the question of the reduction of the capacity of the channel, in the course of time, by silting, a phenomenon on which exact data are lacking. It would appear that the main plan must, as already noted, involve deliberately restoring the natural floodway of the Tensas and Atchafalaya rivers as a means of flood relief.

As the Mississippi problem is probably the greatest engineering work ever faced by any nation, involving as it does 31 States and 20,000 square miles of territory, it has attracted unusual

attention. Following the disastrous flood of 1927, plans were proposed both by the Mississippi River Commission and by the Chief of Engineers of the U. S. Army. As far as physical characteristics were concerned, the reports differed but little, whereas in estimate of cost the former was \$775,000,000 while the latter was only \$296,400,000, the principal difference being in allowance for higher and more extensive levees, etc., and in an estimate for damages for private property taken for the work and for which the army engineers made no allowance.

Throughout the year, Mississippi Flood Control continued to be discussed by engineers and others. Engineers in general confined their statements to the need for careful consideration of the problem rather than any quick acceptance of plans, and to urging civilian engineering representation on the flood commission instead of leaving the matter entirely in the hands of government and military engineers. There was also much discussion as to whether the work should be paid for by the Federal Government or by States immediately concerned.

Final action was taken when President Coolidge signed the Jones-Reid Bill on May 15, 1928, providing for flood relief and carrying an appropriation of \$325,000,000. The work will be prosecuted by the Mississippi River Commission under the direction of the Secretary of War and Chief of Engineers. While, in general, the plan proposed by the Chief of Engineers was adopted, a special committee consisting of the Chief of Engineers, the President of the Mississippi River Commission, and a civilian engineer, was appointed to consider the different reports and to recommend action to the President who is given authority to decide the matter. The work includes the section from the Head of the Passes at the delta to Cape Girardeau, Mo. The bill stated that the States having spent large sums in providing previous levee constructions which failed, the cost of the new work would be met by the Federal Government. Thus, a new era of Federal activity in the field of flood prevention is inaugurated.

At this time, General Edgar Jadwin, U. S. A., was Chief of Engineers and C. W. Sturtevant was appointed as civilian engineer to the board of review. The president of the Mississippi River Commission, Col. C. L. Potter, U. S. A. who was of course thoroughly familiar with the plans of that commission, was retired on June 11, 1928, and Col. T. H. Jackson, U. S. A. Corps of the Engineers, was appointed to succeed him. Colonel Potter has since died, (Aug. 6, 1928).

**Vermont Flood Relief.** In order to prevent a recurrence of the Vermont Flood of 1927, causing the loss of 84 lives and over a 30-million-dollar damage, it is proposed to construct storage reservoirs which will serve the dual purpose of power storage and flood retention. A committee appointed by the governor in March, 1928, has submitted plans for five watersheds, the White, Winooski, Lamoille, Missisquoi, and Passumpsic, and recommends that the study of this plan be continued to cover all rivers within the State.

Briefly, the commission points out that the financial situation in Vermont is such that reservoirs for flood retention alone, such as were used in the Miami works in Ohio, are economically impossible. On the other hand, estimates are given showing that reservoirs for power

purposes can be built to supply, for the five rivers mentioned, some 280,000 horse power—far beyond any present market needs. The experience on the Deerfield River in 1927 showed that such reservoirs, usually at low level in the fall when floods occur and hence capable of storing considerable flood flow, were a very effective means of reducing flood discharge. The removal of a number of encroachments of man which obstruct river channels also is recommended, and it is especially noted that the reservoirs must be under competent control and operation as spring floods are not infrequent and, should a flood occur with reservoirs full, the effect of storage in reducing the maximum flood rate would be lost.

**London Flood.** A tidal wave or bore in the Thames Estuary is generally accepted as the cause of a flood which broke over the Thames Embankment at London and did considerable damage, as well as caused some loss of life on Jan. 6-7, 1928. This is the first time such a bore has ever been recorded at London and is the highest water level ever recorded. A barrage across the Thames below the city, which would have prevented such a disaster, was dismissed in 1906 as impractical, but some additions to the embankment will probably be made.

Other flood projects of importance include the San Gabriel project discussed under DAMS, and it is obvious that one of the great civil engineering activities in the coming years will be in flood protection. In this connection, it is to be hoped that the studies and designs will be fully described and published, as has been done so completely by the Miami Conservancy District, so that the literature of the subject may be more completely developed.

**FLORENCE.** The most important city of central Italy. The population in 1926 was 265,799 and in 1928 was estimated to be 277,688. The metallurgical industry has been revived, iron, copper, and other Tuscan minerals which were previously exported being refined in the furnaces of Porto Ferraio and Piombino. Chemical manufactures have also been introduced, and the glass works of Colle Val d'Elsa are known throughout the world on account of their great production of flasks for Chianti wine. The centre of Florentine life is the Piazza della Signoria, in which stands the majestic Palazzo Vecchio, the seat of the municipality. In contrast to the Renaissance Cathedral and Baptistery are the Post and Telegraph Building, erected in the Piazza Vittorio Emanuele in 1917, and the Museo Civico Bardini in the Palazzo Bardini. The latter contains the valuable art collection of the art dealer, Bardini, which was bequeathed to the city in 1922. Until 1919 the Palazzo Pitti was frequently occupied by the Royal Family, but in 1922 the entire palace was converted into an art museum in connection with the famous Palazzo degli Uffizi. In the court of the Ambulance Barracks in the Via Cherubini, a monument was erected in 1924 in memory of the 200 Italian physicians who fell in the World War. On the left bank of the Arno, in the western outskirts of the city, workmen's dwellings have been erected under the auspices of the Ministries of National Economy and Public Works. Three different types have been erected. Those in the Via Bronzino are for workmen whose daily earnings average about 20 lire; those in the Via Pisano are for a better class of tenant; and the remainder are for the poorest class. The dwellings, which are built of stone,

faced with colored plaster, are grouped around gardens or courts. One-third of the capital required was contributed by the state, one-third by the commune, and one-third by a savings bank. A system of motor roads from Florence to the Mediterranean coast is under construction at a cost of 1,000,000 lire per kilometer (about \$84,200 per mile). The Florence-Torre del Lago speedway will include 85 bridges, 3 viaducts, 1 tunnel, 60 transverse raised crossings, and 70 transverse sunken crossings.

**FLORIDA. Area and Population.** The twenty-first State in size (58,666 square miles), and the thirty-second in population; capital, Tallahassee. The population increased from 752,619 in 1910 to 988,470 in 1920, a gain of 28.7 per cent; 1925 State census, 1,263,549; estimated population, 1928, 1,411,000. The white population rose from 443,634 (1910) to 638,153 (1920); the Negro, from 308,669 to 329,487; native white, from 409,792 to 595,145; foreign-born white, from 33,842 to 43,008. The urban population increased from 219,080 to 355,825; rural, from 533,539 to 612,645. Cities grew thus: Jacksonville (q.v.), from 57,699 to 91,558; Tampa, from 37,782 to 51,608; Pensacola, from 22,982 to 31,035; and Miami, from 5471 to 29,571.

**Agriculture.** Although Florida is not one of the leading cotton-producing States, cotton raising is an industry of considerable importance. Like other Southern States, Florida has undergone and to some extent corrected the ravages of the boll weevil, which was well established in the State by 1916-17. (See *CORRON*.) The extent of this damage is indicated by a comparison of the acreage and production for several years: In 1913, 188,000 acres and 59,000 bales; in 1916, 191,000 and 41,000; in 1920, 100,000 and 18,000; 1928, 95,000 and 20,000.

While the population of the State increased rapidly, the number of farms increased 9.7 per cent, or from 54,005 in 1920 to 59,217 in 1925; the acreage in farms decreased 3 per cent, or from 6,046,691 to 5,804,519; and the improved land in farms from 2,297,271 to 2,022,284 acres. The total value of farm property showed an increase of from \$143,183,183 (1910), to \$513,884,122, or at the rate of 259 per cent; while the average value per farm rose from \$2863 to \$8678. In interpreting these statements, however, inflation of currency during the World War is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of the total area of Florida occupied by farms increased from 15 in 1910 to 16.7 in 1925. In 1925, of the total number of farms, 45,386 were operated by owners; 1010, by managers; and 12,021, by tenants; while comparative figures for 1910 were 35,399; 1275; and 13,342. The white farmers in 1925 numbered 47,205, as compared with 35,295 in 1910; colored, 12,012, as compared with 14,721. The farms reported as under mortgage numbered 8857 in 1925; and 5160 in 1910. The number of cattle was 656,217 in 1924, and 845,188 in 1910; dairy cows in 1924 numbered 43,638; sheep, 59,729 (1924), as against 113,701 (1910); swine, 497,780 and 810,069, respectively. The estimated production of the principal farm crops in 1928 was: Corn, 7,891,000 bushels; potatoes, 3,875,000; sweet potatoes, 2,464,000 bushels; hay, 67,000 tons; tobacco, 9,221,000 pounds; and peanuts, 25,300,000

pounds. (For cotton, see above.) Comparative figures for 1913 are corn, 10,125,000 bushels; oats, 900,000; potatoes, 912,000; tobacco, 4,000,000 pounds; and cotton, 59,000 bales. The increase in production of citrus fruits, from 1909 to 1928 was: Oranges, 4,852,967 to 12,000,000 boxes; grapefruit, 1,061,537 to 8,000,000 boxes.

**Mining.** Florida is not an important mineral-producing State. Domestic phosphate-rock production continues chiefly from this State. Other resources include clay products, fuller's earth, mineral waters, and sand and gravel. The production of phosphate rock in 1914 was 2,138,891 long tons, valued at \$7,354,744; in 1920, 3,369,384 (\$19,464,362); in 1921, 1,780,028 (\$10,431,642); in 1926, 2,708,207 (\$8,683,508). The total value of the mineral products increased steadily from \$4,886,010 in 1915 to \$22,923,780 in 1920; but fell to \$12,597,948 in 1921; for 1926 it was \$19,700,522.

**Manufactures.** Florida is not one of the important industrial States, although its manufactures recently have shown a steady increase. There are 10 cities with a population of more than 15,000, including Jacksonville, Tampa, Miami, Pensacola, Key West, and St. Petersburg. These cities for years have furnished not far from one-half of the State's manufactured products. The total number of establishments in 1909 was 2159; 1919, 2582; 1925, 1863; 1927, 1912. The persons engaged in manufactures in those years numbered 64,810, 82,986, 66,204, and 61,219. The capital invested was \$65,290,640 in 1909, and \$206,293,570 in 1919. In 1909 the value of the products was \$72,889,659; 1919, \$213,326,811; 1925, \$267,000,829; and in 1927, \$218,790,152. The high total in 1919 was in a great measure due to changes in industrial conditions brought about by the World War. The principal industries are those connected with lumber and timber products, with products valued in 1909 at \$20,803,000; 1919, at \$50,409,000; and 1925, at \$43,030,860. Tobacco, cigars, and cigarettes were high in value: in 1909, \$21,570,000; in 1919, \$37,926,000; and in 1923, \$36,000,000. Shipbuilding, especially during the War, acquired great importance, the value of the product rising from \$697,000 in 1909 to \$804,000 in 1914, and to \$8,428,000 in 1919. Florida is first among the States in the production of turpentine and rosin; in 1909 the value of these products was \$11,938,000; 1919, \$21,509,000; and 1925, \$14,110,363. Tampa is the first of the cities in manufacturing importance, with 182 establishments and products valued at \$13,804,000 in 1909; 202 and \$14,039,000 in 1914; and 218 and \$55,446,901 in 1925. The number of manufacturing establishments of Jacksonville increased from 114 in 1909 to 173 in 1914, and 204 in 1925; the value of the products, from \$6,722,000 to \$10,148,000, and to \$49,314,650, respectively.

**Education.** Florida has been one of the most progressive of the Southern States in the development of the educational system. Its advance dates from 1892, the year in which the school system of the State was reorganized. Elementary instruction has been greatly extended, and advance made in high-school education has been still more noticeable. Vocational education has been greatly developed in the fields of both industrial and commercial study; and stress has been placed also on instruction in home economics. The Legislature of 1923 passed a teachers' examination certification law, which aimed at improving the grade of teachers em-

ployed. The general progress of this period is indicated by a comparison of the figures of enrollment for several years. In 1912-13 the total school enrollment was 164,727; in 1919-20, 225,160; in 1925-26, 342,643. Enrollment in the white schools in 1912-13 was 106,777; 1919-20, 157,666; 1925-26, 263,458. Enrollment in the Negro schools in 1912-13 was 57,050; in 1919-20, 67,494; and in 1925-26, 79,185. Attendance in the high and elementary schools of the State was at the daily average of 250,355 in 1925-26. Expenditures for public day schools increased from \$2,713,390 in 1912-13 to \$30,089,478 in 1925-26, of which \$14,497,559 was capital outlay. The percentage of illiteracy in the State fell from 15.5 in 1910 to 10.9 in 1920. Among the native white population, it decreased from 5.7 per cent to 3.7 per cent; among the foreign-born white, from 10.5 to 6.6 per cent; and among the colored, from 28.8 to 24.8 per cent.

**Finance.** Expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$14,210,985 (of which \$1,372,698 was aid to local education); for interest on debt, \$566,149; for permanent improvements, \$23,041,662; total \$37,818,796 (of which \$22,252,223 was for highways, \$2,696,272 being for maintenance and \$19,555,951 for construction). Revenues were \$27,390,541. From property and special taxes, 20.9 per cent was derived; from departmental earnings and payments for officials' services, 7.9 per cent; from sale of licenses and from gasoline taxes, 57.7 per cent. Property valuation was \$786,054,528; State taxes levied thereon were \$5,926,584. Net State debt was nil, but the State was under contingent liability of \$10,250,000 for debts of the Everglades drainage district.

**Political and Other Events.** While the State continued Democratic in national elections until its Republican swing of 1928, in domestic politics there was a serious break in the party alignment which resulted in the defeat, in 1916, of the Democratic candidate for governor. In 1914 elections were held for minor State officers and for United States Senator. Duncan U. Fletcher was the successful candidate for the latter post, and the Democrats were uniformly successful in electing their candidates. In 1916, when a new Democratic primary law was for the first time put into effect, Sidney J. Catts, candidate on the Prohibition-Independent ticket, defeated W. V. Knott, the Democratic candidate, for governor, and Park Trammell, Democrat, was elected United States Senator. In 1916 President Wilson received 55,984 votes and Charles E. Hughes, 14,611. A proposed "grandfather clause" amendment to the constitution, designed to prevent Negroes from voting, was defeated at this election. In 1917 the Seminole Indians of the State were granted an area of 100,000 acres near the Ten Thousand Islands. In the 1918 elections, the Democrats were uniformly successful. At this election, an amendment to the constitution providing for State-wide prohibition was adopted. In 1920 Cary A. Hardee, Democrat, was elected governor, and Fletcher was reelected to the Senate; for President, Cox received 90,515 votes and Harding 44,853. Alleged peonage in the lumber camps of the State resulted in investigations by grand juries and other bodies in 1922-23. On Apr.

26, 1923, the State Senate, in executive session, ordered the removal of Sheriff J. R. Jones, of Leon County, charged with beating prisoners at county convict camps. On May 14, the Legislature enacted abolition of whipping at the convict labor camps. In 1924 the presidential vote was: Davis (Democratic), 62,083; Coolidge (Republican), 30,633. In 1928 the State broke a long-established precedent by giving a majority to Hoover (Republican) who received 144,168 votes to 101,764 for Smith (Democratic). Doyle E. Carlton (Democrat) was elected governor. The southern part of the State was devastated by hurricanes, Sept. 18, 1926, and Sept. 15, 1928.

**Legislation.** In 1915 measures regulating the liquor traffic were adopted. A special session in 1918 passed measures to enforce the prohibition amendment to the State constitution. The State tax commission was abolished. The Legislature of 1910 passed a measure providing for the compulsory school attendance of children under 16. In 1921 a tax of one cent a gallon was placed on gasoline, the revenue to be used for the building and maintenance of State highways. A constitutional amendment to be submitted to the people in 1922 was passed, providing for the reappointment of legislative representation and increasing the membership of both the Senate and the House; measures were passed substituting electrocution for hanging; the infliction of cruel or inhuman treatment upon inmates of State institutions was forbidden; and a bill was passed to facilitate the cooperative marketing of agricultural products. In 1923 the Legislature adopted a measure declaring that "Darwinism, atheism, and agnosticism" should not be taught in the institutions of the State.

**FLORIDA, UNIVERSITY OF.** A State institution of higher learning for men, at Gainesville, Florida; founded in 1905. The student enrollment increased from 349 in the year 1913-14 to 2155 in 1928-29, and from 140 in the summer session of 1914 to 1683 in 1928; the faculty between 1913-14 and 1928-29 increased from 63 to 150 members. A gymnasium was built in 1919; an auditorium, a unit of the administration building, was completed in 1924; a unit of the new library in 1925; chemistry and horticulture buildings, and an addition to the engineering building in 1927; while in 1928 a 179-room dormitory was under construction. Among the important changes which took place in 1925 were the organization of the school of pharmacy into a college, the addition of a school of architecture to the engineering college, and the addition of the school of business administration and journalism to the college of arts and sciences; the schools of architecture and business administration were established as separate colleges in 1926; a professorship of Southern History was established in the same year; and a number of scholarship and student-loan funds were given to the university. In September, 1928, John James Tigert, LL.D. resigned as U. S. Commissioner of Education to become president of the University of Florida, succeeding Albert Alexander Murphree, LL.D., who died in December, 1927.

**FLOTATION.** See CHEMISTRY, APPLIED.

**FLOTILLA LEADER.** See VESSEL, NAVAL.

**FLYING BOAT.** See AERONAUTICS.

**FLYNN, WILLIAM JAMES** (1867-1928). A chief of the United States Secret Service, born in New York, where he was educated at the public schools. He entered the Secret Service

Department of the United States Government in 1897. In the period 1912-17, he was chief of the Secret Service; in 1918, chief of the Secret Service of the United States railroad administration, and director of the Bureau of Investigation of the Department of Justice, 1919-21. After his resignation, he made his headquarters in New York City, where he edited *Flynn's Weekly*.

**FOCH, FERDINAND** (1851-1929). A Marshal of France and Commander-in-Chief of the Allied armies in 1918. He was born at Tarbes, educated at the Catholic College of St. Clément at Metz, and at the École Polytechnique, and entered the army. He advanced rapidly, acted for a time as an instructor of tactics at the Military School of Paris, and later became commandant of the same Academy. During the World War, he served at the Marne, Ypres, and the Somme, entered the Higher War Council in 1917, and in the same year became the French commander on the Italian front. In March, 1918, he was appointed the generalissimo of the Allied armies, and after the winning offensive which he planned and commanded, he drafted and presented the German delegates with the armistice terms of Nov. 11, 1918. Foch was often criticized for halting hostilities instead of continuing the offensive onto German territory, but he held that such a course would mean a useless sacrifice of life. He was elected to the French Academy (1918) and to the Academy of Science, was given the British Order of Merit (1918), having been created a Knight of the Grand Cross of the Bath in 1914, was made a British Field Marshal in 1919, the first foreigner to be so honored, and in 1917 he received an honorary D.C.L. degree from Oxford University. He received the Distinguished Service Medal of the United States; France gave him the Grand Croix of the Legion of Honor, the Médaille Militaire, and the Croix de Guerre, as well as other honors, but he refused all gifts excepting the Paris house lent to him by the French Government, living simply, on his army pay. He was president of the Allied Military Commission which sat at Versailles, and in 1921 visited the United States as the guest of the American Legion. His only son was killed in active service during the War. On Marshal Foch's death from influenza and pneumonia, after an illness of two months, on Mar. 20, 1920, a state funeral was decreed, the first in thirty years. On the 24th, his body lay beside that of the Unknown Soldier under the Arc de Triomphe; on the 25th, it was placed in the Cathedral of Notre Dame where the requiem mass was said the following day. The funeral procession marched through the rue de Rivoli and the Champs Élysées to the Invalides, where Premier Poincaré delivered the funeral oration. Representatives of all the Allied nations joined in the ceremonies. He worked on his memoirs for two years before his death, but was unable to complete them. His other writings were *Les Principes de la Guerre* (1903); *De la Conduite de la Guerre* (1904); and *Éloge de Napoléon* (1921); Consult *Les Trois Maréchaux*, by Le Goffie (1919); *Le Maréchal Foch*, by Louis Madelin (1925); *Foch Speaks*, by Major Charles Bugnet (Eng. trans., 1929). See WAR IN EUROPE.

**FOG SIGNALS.** See LIGHTHOUSES; RADIO TELEGRAPHY.

**FOKKER, fōk'kér, ANTHONY HERMAN GERARD** (1890- ). A Dutch-American aircraft constructor who was born in Kediri, in the

Dutch East Indies and educated in Haarlem, Holland. A pioneer in the construction of airplanes, his first factory was in Schwerin, Mecklenburg. The Germans made much use of his pursuit planes and devices during the World War. At its close, he established a factory in Holland, and two in America, (Wheeling, Va. and Hasbrouck Heights, N. J.). He had a great influence on new developments in airplane construction involving welded-steel tubing in fuselage construction. Mr. Fokker built his first all-steel fuselage in 1911. He became a citizen of the United States, and was the designer of the plane in which Commander Richard E. Byrd crossed the Atlantic.

**FOLINSBEE, JOHN FULTON** (1892- ). An American landscape painter born in Buffalo, N. Y., and educated at the Art Students' League in New York and the Woodstock School of Art. He was a pupil of John Carlson, F. V. DuMond, and Birge Harrison. He is known especially for his winter landscapes, painted in straightforward impressionistic technique, and is represented in the Corcoran Gallery at Washington, in the Syracuse Museum, and in the National Arts Club of New York. His long list of awards includes the Carnegie and J. Francis Murphy prizes from the National Academy of Design in 1921, the first Hallgarten Prize of the National Academy in 1923 and the U. Francis Murphy Prize in 1926. He was elected a member of the National Academy of Design in 1928.

**FOLK, JOSEPH WINGATE** (1869-1923). An American lawyer and public official (see Vol. VIII). From 1914 to 1918, he was chief counsel for the Interstate Commerce Commission.

**FOLKLORE.** See ETYMOLOGY.

**FOLK PSYCHOLOGY.** See SOCIAL PSYCHOLOGY.

**FOOD AND NUTRITION.** Ideas as to what constitutes a complete food have changed considerably since the early years of the century. The beginning of this change was perhaps the discovery that proteins are unlike in composition and that they are complete or incomplete and of good or poor biological value in so far as they do or do not contain in sufficient amounts certain of the amino acids or "building stones" of which they are composed. Fortunately, the essential amino acids which must be supplied in the food are few in number, and in an ordinary mixed diet the deficiencies in one protein are compensated, by an abundance of the necessary constituents in others. It is essential, however, to bear in mind that all proteins are not of equal nutritive value. In general, the cereal grains contain proteins of lower value than do meats, eggs, and milk, and should not be used as the exclusive source of protein.

**Vitamins.** As an outcome of the study of the relative nutritive value of the different proteins came the discovery of the vitamins, those essential food constituents present in natural foods in such small amounts as to have escaped detection for many years and the chemical nature of which is as yet uncertain. At present, six independent vitamins differing in physical, chemical, and physiological properties are recognized, and in all probability these do not complete the list. It has become the custom to name the vitamins alphabetically, as their independent existence is determined, although descriptive adjectives are frequently used to distinguish between the physiological properties peculiar to each. Vitamin A, sometimes known as fat-soluble A, the anti-ophthalmic or anti-ex-

IN THE WORLD WAR**

ophthalmic vitamin, or more properly the anti-infective vitamin, is essential for growth, well-being at all ages, and successful reproduction, and more especially for resistance to infections of various kinds. Its complete absence from the diet of experimental animals is followed by degenerative changes accompanied by infection in the mucous membranes throughout the body. The most easily detected of these is an eye infection, but probably of more frequent occurrence are abscesses at the base of the tongue. Infection in the ear, sinuses, lungs, and alimentary tract often occur. It is thought that many common suppurative processes in man may be due to lack of vitamin A. This vitamin occurs in milk (especially in the butter fat), eggs, green leafy vegetables, and many yellow pigmented foods. When consumed in excess of requirements, it can be stored in the body for future needs, and for this reason and because of its great importance in increasing the resistance of the body to infection, foods rich in this vitamin should be eaten regularly and abundantly.

The next in alphabetical order, vitamin B, is now known to be made up of at least two and possibly more independent vitamins. The mixture, or vitamin B complex, as it is sometimes called, is essential for the maintenance of appetite, growth, reproduction, lactation, and the proper functioning of the digestive tract. Its complete absence from the diet is followed in a short time by loss in appetite, rapid loss in weight, and death. Unlike vitamin A, the body has only a limited capacity for storing vitamin B. It has recently been found that very much more of the vitamin B complex is required for lactation than for growth, and it is thought that lack of sufficient vitamin B may be the cause of a high percentage of infant mortality.

The two vitamins now identified in vitamin B are commonly called vitamin F and G in the United States and B<sub>1</sub> and B<sub>2</sub> in England. Vitamin F is the anti-neuritic vitamin formerly thought to be identical with vitamin B but now known to be a part of it. Vitamin G is often spoken of as the anti-pellagric vitamin for its absence from the diet of experimental rats is followed by symptoms very similar to pellagra in man, and human pellagra may be prevented and cured by substances which are good sources of this vitamin. Among the few foods which have been tested for vitamin F and G separately, cereal grains are good sources of F and poor of G, and milk and green vegetables good sources of G and poor of F. Bread and milk thus supplement each other with respect to these vitamins and become a richer source of what has been known as vitamin B than either one alone. Each of these vitamins is essential for growth.

Vitamin C, sometimes known as water-soluble C, or the anti-scorbutic vitamin, is essential for growth and well-being in certain laboratory animals and in man. Its complete absence from the diet leads to the well-known disease, scurvy. An inadequate supply leads to loss of stamina, tooth decay, decreased resistance to infection, and possibly to much of the so-called rheumatism. The capacity of the body to store this vitamin is limited. Citrus fruits and tomatoes are particularly good sources of this vitamin.

Vitamin D, otherwise known as the anti-rachitic vitamin, resembles vitamin A in that it is soluble in fats and fat solvents and can be stored in the body to an important extent. Like the other vitamins, it is essential to growth and well-

being. It plays an important part in the assimilation and utilization of calcium and phosphorus, and thus in the prevention of rickets, particularly when these elements are present in the food in unfavorable proportions. At present, it occupies the unique position among vitamins in being the only one which has been synthesized in the laboratory from a definite chemical compound. Its inactive precursor or pro-vitamin is ergosterol, which is transformed into vitamin D by suitable irradiation with ultra-violet light. The skin also contains ergosterol so that by the action of light on the skin, vitamin D can be formed within the body. Since ergosterol is present in many food materials, it is possible to synthesize vitamin D in these materials by irradiation. Cod liver oil is one of the richest natural sources of vitamin D. Egg yolk is relatively rich in this vitamin, and milk and dairy products contain it in appreciable though not large amounts.

Vitamin E, the anti-sterility vitamin, belongs to the group of fat-soluble vitamins and resembles vitamin A to a marked extent in its physical and chemical properties. As is indicated by its descriptive name, this vitamin is characterized chiefly by its function in completing the reproduction processes, although it should be kept in mind that absence of any of the vitamins, as of any other essential constituent of food, has an indirect influence on reproduction. Wheat embryo and green lettuce are among the richest sources of vitamin E.

The increasing evidence of minor symptoms, particularly lack of stamina, a tendency to digestive disturbances, and a lowered resistance to infection, resulting from an insufficiency of vitamins makes their consideration a matter of great importance. There is no evidence that excess of any of the vitamins as present in natural foods is harmful, and, since the absolute requirements for human nutrition are as yet unknown, it is well at all times to furnish an abundance of vitamin-containing foods. In this respect milk is an ideal food. It is an excellent source of vitamin A, a good source of vitamin G, contains appreciable amounts of vitamins C and D, and is furthermore the best source of calcium for growing children. It is customary in infant feeding to safeguard possible vitamin deficiencies in milk by the use of a little orange or tomato juice for vitamin C, cod-liver oil for vitamin D, and occasionally wheat germ or yeast extract for the vitamin B complex. In a mixed diet, plenty of milk and an abundance of green vegetables and fruits will insure an adequate supply of vitamins.

**Mineral elements.** Although the necessity in the diet of certain mineral elements, such as calcium, phosphorus, and iron, has long been known, it is beginning to be realized that other mineral elements present in natural foods in traces only may be of equal importance. Iodine is now universally recognized as a food constituent essential for the prevention of goiter. In goitrous localities, the introduction of minute amounts of iodine into the diet through its addition to the drinking water or to common salt has met with success, and iodized salt is now purchasable at almost any grocery store. Discrepancies in the value of different sources of iron in the treatment of simple nutritional anemia have been traced to the presence or absence of copper, traces of which are apparently essential for the utilization of iron in hemo-

globin formation. Some evidence also has been obtained that small amounts of manganese are likewise effective in supplementing iron. The ash of various food materials has been found to be effective in the cure of severe experimental anemia produced by repeated bleedings. It appears probable that a proper balance of many inorganic elements is essential for successful nutrition.

**Standards of nutrition.** In general, the requirements for successful nutrition are included in what might well be called the nutrition creed, as expressed by Sherman: "(1) Sufficient of the organic nutrients in digestible form to yield the needed energy, (2) protein sufficient in amount and appropriate in kind, (3) adequate amounts and proper proportions of the various ash constituents or inorganic foodstuffs, and (4) sufficient of the essential vitamins." Although the recent developments, as summarized above, indicate that information may still be incomplete concerning at least the third and fourth articles in the creed, there has been a gradual change in the past few years toward higher standards of nutrition. With increased knowledge of food requirements, the goal is now *optimal* rather than *adequate* nutrition. The use as laboratory reagents for nutrition studies of the rat with a life span only about one-thirtieth that of human beings, has made it possible to show that diets hitherto considered adequate are capable of still further improvement.

Increasing attention is being given, particularly in the United States, to the nutrition of school children. Various indices of nutrition have been proposed and are being used to determine the extent of malnutrition. The most commonly used is the Baldwin-Wood standard of height and weight for age. These standards, while not infallible, serve to indicate roughly the nutritional status of the child, and considerable success has been attained in correcting malnutrition as thus detected by supplementary school lunches, usually milk. In Great Britain, a long-time experiment on a large scale showed almost as good results from skim milk as from whole milk. Undernourished children have been shown to have a high protein requirement, and the value of supplementary milk feeding is attributed by some quite as much to the quantity and quality of its proteins as to its content of calcium and vitamins.

**Diet in relation to disease.** *Diabetes.* The use of insulin with properly controlled diets has changed the mortality rate among diabetic children from about 80 per cent to 1 per cent. The necessity for rigid control of the diet has afforded an opportunity to study the effect of properly balanced diets upon the general nutritional condition of children. Investigators at the University of Iowa Medical School have found the growth response of diabetic children under careful dietary control to be greater than that of the so-called superior groups of nondiabetic children according to the Baldwin standard. It was found also that children who had been under dietary treatment for diabetes for six months or more invariably showed signs of arrested caries in place of progressive caries before the treatment. This was thought to indicate the dependence of dental caries in children upon recent dietary inadequacies and the possibility of checking or preventing caries by adequate diets. Joslin has recently emphasized the hereditary nature of

diabetes and the possibility that the disease may be latent in the parent until after it has appeared in the child. For this reason, he recommends the avoidance of obesity by all the relatives of a diabetic child as middle life is approached.

**Pernicious anemia.** With the discovery by Minot and Murphy of the beneficial effects of liver in the treatment of pernicious anemia, this disease may now be classed among the nutritional diseases. The publicity given to this treatment caused liver eating to become quite a fad, regardless of the type of anemias or even definite proof of an anemic condition. While liver is undoubtedly an excellent article of diet, other foods may be substituted for it in simple anemia or as a source of vitamins, but thus far nothing, with the possible exception of kidney, has been found to serve the same purpose in pernicious anemia. For this reason, the wave of popularity for liver has worked a hardship in the case of pernicious anemia patients on account of the exorbitant cost and scarcity of calves liver.

**Pellagra.** Although it is generally conceded that lack of a specific vitamin, vitamin G, is responsible to a certain degree in the development of pellagra, the pellagra problem is not yet solved. Salmon and his associates at the Alabama Agricultural Experiment Station have obtained rather convincing evidence that experimental pellagra in rats involves not only a dietary deficiency but an infection, a comparatively nonpathogenic organism becoming pathogenic as a result of a deficiency of the anti-pellagic vitamin.

**Rickets.** The possibility of duplicating the effect of cod-liver oil or other sources of anti-rachitic vitamin by suitable exposure to sunlight or ultra-violet light has led to the exploitation of ultra-violet lamps and special glass for windows. While such glass may be of value in hospital solariums, the expense of installation is hardly justifiable in ordinary homes, nor are ultra-violet lamps within the reach of everyone. In England and on the Continent, irradiated ergosterol is being used extensively in the prevention and treatment of rickets. These measures have tended to obscure the fact that rickets is essentially a matter of nutritional deficiency, and that the action of sunlight or artificial light is probably to form the anti-rachitic vitamin in the body, the function of which is to promote better utilization of calcium and phosphorus. Attention should be paid quite as much to securing an abundance of calcium and phosphorus as of the anti-rachitic vitamin. Park, a critical student of rickets not only under laboratory but clinical conditions, has stated his belief in the possibility of abolishing rickets by food and sunlight as follows: "Personally, I believe that if pregnant women received ample well-balanced diets in which green vegetables were abundantly supplied and cow's milk was regularly taken, and kept a sufficient part of their time in the open air and sun, and if their infants were placed in the direct rays of the sun for a part of each day and were fed cod-liver oil for the first two or three years of life, more could be accomplished in regard to the eradication of caries of the teeth than in all other ways put together, and that rickets would be abolished from the earth."

All in all, the discoveries of the past two or three decades in the field of nutrition have emphasized the importance of what has sometimes been called the "infinitely small" factors in nu-

trition and have shaken the belief that knowledge is complete concerning what constitutes a balanced diet. While the requirements for successful nutrition may still be stated in terms of the four factors referred to above, there is still much to be learned concerning each of these factors, but more particularly the balance of ash constituents and the balance of vitamins.

**FOOT-AND-MOUTH DISEASE.** See VETERINARY MEDICINE.

**FOOTBALL.** Several varieties of football are played, but the term is becoming more and more restricted to the type of game which has made such amazing headway in the American college world. No other sport in modern times has gained so firm a grip on the college man or aroused the intense interest of an immense number of spectators among the public at large as football. Stadiums of sufficient seating capacity to care for the hosts that clamor to see the more important games are still being constructed and each year sees larger and larger amphitheatres erected. Increasing curtailment of the number of tickets allowed to alumni and undergraduates has been made necessary.

The changes made in the rules for the original game have unquestionably contributed greatly to football's increased popularity. Mass play was legislated against and the so-called open play introduced. It is possible now for the average spectator, as well as the gridiron expert, to get the drift of what is going on.

Although the rule makers have done well with most of their innovations, their recent move in 1927 aroused considerable criticism. This called for the removal of the goal posts to a place 10 yards behind the last chalk mark, which has "killed" the drop kick for goal, one of the prettiest manoeuvres of the game in the opinion of many.

No such thing as a "championship eleven" is

now possible in American college football. There is no "world series" between two league or sectional title holders. The only way that the question of supremacy could be settled would be the arrangement of a post-season game between two preëminent teams, but the college authorities have always opposed such a procedure.

But if football can boast no champions, it yet has many elements to afford the desired "thrills." With the open game, the little college is put on a fairly equal footing with the members of the "Big Threes" and "Big Fours," etc. Every gridiron season, therefore, is sure to have its quota of upsets. The intersectional contests also afford much interest and much food for analysis.

The success of the college game led inevitably to the advent of professional football with the teams being recruited mainly from former college players of reputation. In a few cities in the Middle West, this movement appears to be successful in a financial way with the public rallying to its support, but in New York and other Eastern cities, the professional clubs do not appear to be gaining the necessary followings. See SOCCER.

**FORAIN, fô'rân', JEAN LOUIS** (1852- ). A French caricaturist, etcher, and painter (see VOL. VIII). He was elected President of the Académie des Beaux Arts in 1928, and was President of the Société Nationale des Beaux-Arts. During the World War, his weekly cartoons in *L'Opinion* were notable, and later he executed an important series of etchings on war subjects. Although most widely known as a penetrating illustrator of French manners, in which capacity he has continued to contribute to numerous periodicals, as an etcher he is styled incomparable, and his work in painting is delicate and delightful. Additional publications include *Nous, vous, eux*; *La Vie*; and *De la Marne au Rhin*.

**FORAKER, JOSEPH BENSON** (1840-1917). An American legislator (see VOL. VIII). He was defeated by Warren G. Harding in the Republican primaries for a seat in the Senate in 1914. A year before his death, he published *Notes on a Busy Life*.

**FORBES, JAMES** (1871- ). A playwright, born at Salem, Ont. He went to the United States in 1884 and was successively dramatic critic, editor, and press representative. He first attempted play-writing in *The Chorus Lady* (1906), an immediate success. He organized and directed the formation of groups of professionals sent to Europe to entertain the American Expeditionary Forces during the World War, organized the first stock company of actors to play in repertoire in France, and originated the plan of organizing other actors who were serving in the army into stock companies. His later plays include *The Show Shop*; *The Famous Mrs. Fair* (1919); *The Endless Chain* (1922); and *Young Blood* (1926).

**FORBES, W (ILLIAM) CAMERON** (1870- ). An American public official (see VOL. IX), who was appointed by President Harding to the Wood-Forbes mission to investigate conditions in the Philippine Islands in 1921. He was overseer at Harvard, 1914-20. He wrote: *As to Polo* (1920); *The Romance of Business* (1921); *The Philippine Islands* (1928).

**FORD, FORD MADOX** (1873- ). An English author, son of a German, Hueffer, whose

name he later abandoned, and editor of the *Transatlantic Review*. His education consisted largely in listening to the conversations of the Pre-Raphaelites and visiting relatives in France and Germany. Strongly influenced by the Henley group, who considered that one ought to undergo a real struggle with existence, he worked on a farm for thirteen years. Conrad and Henry James were in the neighborhood, and he came under the influence of the latter, and wrote *The Inheritors* (1901) and *Romance* (1903) with the former. He was gassed while with the British forces in France during the World War and temporarily lost his memory. His biographies were *Life of Madox Brown*, his grandfather, the painter (1896), *Henry James* (1913), and *Joseph Conrad* (1924). Miscellaneous works included *The Pre-Raphaelite Brotherhood* (1907); *Ancient Lights* (1911); *Thus to Revisit; Some Reminiscences* (1921); *Mr. Bosphorus and the Muses; or a short History of Poetry in England* (1923); *New York Essays* (1927), and *New York is not America* (1927). His travel books were *The Soul of London* (1905) and *A Mirror to France* (1926). *The Collected Poems of Ford Madox Hueffer* appeared in 1914 and 1916, and were supplemented by *New Poems* in 1927. His novels were of two kinds—the historical and the modern. The former included *The Fifth Queen* (1906); *Privy Seal* (1907); *The Fifth Queen Crowned: A Trilogy* (1908); *Ladies Whose Bright Eyes* (1911), and *A Little Less Than Gods*, dealing with the French Revolution (1928). Some of his novels of modern life were *Mr. Apollo* (1908); *A Call* (1910); *The Good Soldier* (1915); *Some Do Not* (1924); *More Parades* (1925); *A Man Could Stand Up* (1926); and *The Last Post* (1928).

**FORD, GEORGE BURDETT** (1879– ). An American architect and specialist in city planning, born at Clinton, Mass., and educated at the Massachusetts Institute of Technology and the École des Beaux-Arts in Paris. He began practice in Boston in 1901, afterward continuing in New York City. As a specialist in city planning, he was consultant, at various times, for New York City, Passaic, Jersey City, N. J.; Omaha, Neb.; Springfield, Mass.; Cincinnati, Mansfield, Ohio, and many other cities. In France, he was consultant to the French government for the reconstruction of cities in the devastated regions after the World War.

**FORD, HENRY** (1863– ). An American manufacturer (see VOL. IX). In December of 1915, he chartered a ship to send a party of peace enthusiasts to Europe with the object of organizing a conference to influence the belligerent governments to cease warfare. The party went to Christiania, Norway, and thence some members proceeded to Stockholm, Copenhagen, and The Hague, but the entire movement ended unsatisfactorily; it was not officially recognized abroad, and dissension arose in the ranks of the members themselves. In 1916 he brought a libel suit against the *Chicago Tribune* for \$1,000,000 because he had been called an anarchist in one of its editorials. The court awarded him a verdict of \$06 and the cost of the trial. A controversy arose in 1918 over the results of the senatorial election between Truman H. Newberry, Republican, and Mr. Ford, Democrat. Ford charged his opponent with excessive expenditure in his campaign. Newberry was charged and convicted, but on appeal to the Supreme Court, the decision was reversed in

January, 1922. Mr. Ford resigned as president of the Ford Motor Company in 1920 and was succeeded by his son. He built and equipped the Henry Ford Hospital in Detroit at a cost of \$7,500,000. About the same time, he bought the *Dearborn* (Mich.) *Independent*, in which from time to time he severely criticized the Jews. This criticism he publicly recanted on July 8, 1927. In 1928 he supported Herbert Hoover for President. In that year he made extensive purchases of early American machines and implements to be placed in his industrial museum. He also made a hobby in later years of collecting early American furniture, household implements, etc. See **MUSCLE SHOALS**.

**FORD, HENRY JONES** (1851–1925). An American journalist and professor of politics (see VOL. IX). In 1920–21 he was a member of the Interstate Commerce Commission. He published *The Scotch-Irish in America* (1915), *The Natural History of the State* (1915), *Woodrow Wilson, the Man and His Work* (1916), *Washington and His Colleagues* (1918), and *The Cleveland Era* (1919).

**FORD, JAMES LAUREN** (1854–1928). An American humorist, editor, and critic (see VOL. IX). He wrote *Waitful Watching* (1916), *Forty-odd Years in the Literary Shop* (1921), and *Hot Corn Ike* (1923), and edited *The Porcupine*, 1917–18.

**FORD, WALTER BURTON** (1874– ). An American mathematician, born at Oneonta, N. Y. He was graduated from Harvard in 1908 and took post-graduate courses at that university and in Europe. He was instructor of mathematics at the University of Michigan, 1900–03, and in 1904–05 at Williams College. After 1905 he was again a member of the faculty of the University of Michigan, serving as professor of mathematics since 1917. He wrote *Plane and Solid Geometry*, 1913; *First Course and Second Course in Algebra*, 1919; *College Algebra* (1922); and *Analytic Geometry* (1924). He also contributed various articles to scientific journals and was editor-in-chief of the *Mathematical Monthly*, 1923–27.

**FORDHAM UNIVERSITY**. A Roman Catholic institution for higher education at Fordham, New York City, founded in 1841. It is under the Society of Jesus and is the largest Roman Catholic institution in America. The student enrollment increased from 1500 in 1913–14 to 7859 in 1928–29, plus 1397 in the summer session of 1928; the faculty was increased from 140 to 212; and the library from 72,700 volumes to 100,000. In 1928–29 the law school enrollment at the University was 1465 and there were, in addition, 175 pre-law students. A gymnasium was built in 1923; the Seismic Observatory, which was a gift of William J. Spain in memory of his son, was completed during 1924; a new library was erected in 1925; a new building which provided a biological laboratory, lecture rooms, and class-room space for about 800 additional students of the college department was completed in 1927; and in 1928 a new faculty building was completed with accommodations for 70, and the seating capacity of the chapel was enlarged to accommodate 1200. In the spring of 1924, the Rev. Joseph Assmuth, from Germany, became head of the biology department; and in 1926 a unit of the Coast Artillery Reserve Officers Training Corps was organized in the college department. President, the Rev. William J. Duane, S.J. Ph.D.

**FORDNEY-McCUMBER TARIFF BILL.**

See TARIFF IN THE UNITED STATES.

**FORDYCE, JOHN ADDISON (1858-1925).** An American physician known especially for his work in dermatology and syphilography. He was born in Guernsey Co., Ohio, and received his degree in arts at Adrian College in 1878 and in medicine at Chicago Medical College in 1881. Later, he studied at the University of Berlin and then returned to practice in New York. He was editor of the *Journal of Cutaneous Diseases*, professor of dermatology in Columbia University, and head of the dermatological clinic at Bellevue Hospital. When the salvarsan treatment of syphilis was first introduced, he took it up with great enterprise and many students were attracted to New York to observe the technic and results of the treatment. His name is commemorated in an ailment known as "Fordyce's Disease."

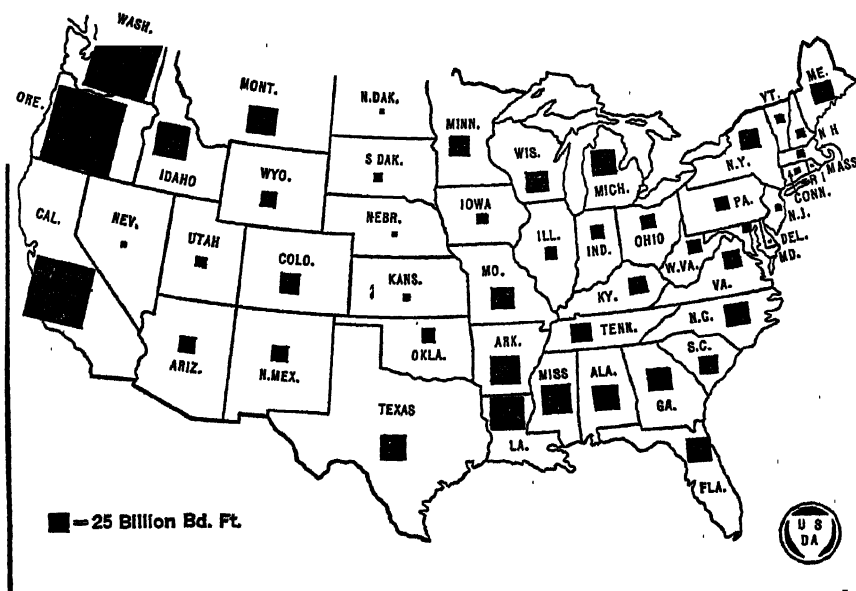

**FOREIGN EXCHANGE.** See FINANCE AND BANKING.

**FORESTRY.** In no single equal period of the world's history were the forest resources of the world so heavily drawn upon as in the years after 1914. Not only the needs of ordinary population growth but the enormous demands of war caused an unprecedented use of lumber, especially the very finest grades. The seriousness of the situation in the United States was indicated in the 1921 report of the Chief Forester, who stated that three-fifths of the virgin timber was gone, and, worse yet, the people were using the remainder at a rate four times that of production. The one redeeming feature of the situation was the growing realization throughout the civilized world at large and in

the United States in particular that forest resources must be conserved in every possible manner. The World Forestry Conference held in Rome, Italy, Apr. 29-May 5, 1926, was a striking example of this increasing interest. A total of 58 widely scattered nations were unanimous in their approval of lumber conservation.

The World War clearly showed how vital forests are to a nation's existence. Without the systematically managed forests of France, the successful prosecution of the War by the Allies might have been grievously delayed. Likewise, it was equally true that the forests of Germany enabled that nation, surrounded as it was by blockading fleets and armies, to endure much longer than it could have without them. One of the peculiar results of the War in relation to forestry was the shutting off for a time of the vast Russian timber supplies from the nations of western Europe. English, French, and German forests suffered severely during the War. It is roughly estimated that in England alone over 1,000,000 acres of private woodlands were cut down for war needs.

**National Forests.** In the United States, the area of the National Forests showed a net decrease of 4,367,608 acres from June 30, 1914, to June 30, 1928, a loss explained in part by the consolidation of small areas and by the release of lands adapted primarily to agriculture. That the National Forests are an important source of income to the Federal government was shown by an aggregate income, during the year ending June 30, 1928, of more than \$5,000,000. The value of the forests as recreation places for the people is beyond calculation. The future of the

**RELATIVE STANDS OF SAW TIMBER BY STATES**

(From U. S. Department of Agriculture.)

Most of the remaining timber in the United States is in the South and West, far away from the great industrial and farming States of the Middle West and Northwest, where the need for timber is greatest. Destructive lumbering has greatly reduced the forests of this region. One of the most urgent economic problems is reforestation—the growing of timber on the immense areas of rough land best suited for forests.

National Forests was brightened by the passage in 1928 of the McNary-Woodruff Law which laid down a definite purchase programme. The importance of increasing Federal holdings is suggested by the fact that approximately only one-fifth of the forest lands of the United States are public property.

**Lumber.** Despite the stimulus of war, there has been a consistent decrease in lumber production in the United States since 1906, when a maximum of 46,000,000,000 board feet was reached. This decline in the face of rapidly increasing population meant a sharp drop in per-capita consumption. Taken in connection with a rapid westward movement of the source of supplies, resulting in ever-increasing transportation costs, the lumber situation became increasingly serious. In an effort to reduce waste resulting from the use of a multiplicity of grades and sizes, a committee on lumber standardization, representing the lumber trade and similar committees from the United States Departments of Agriculture and Commerce, proposed in 1923, as the result of joint studies, a series of standard grades for yard lumber and structural timber of all important species. The Forest Products Laboratory of the U. S. Department of Agriculture has rendered material assistance by determining economical means of using low-grade and waste lumber. The United States Forester repeatedly warned the people of the country of the decreasing supply and urged that efforts be made to stimulate timber production in the United States.

**Reproduction.** The period since 1914 has witnessed unusual expansion in forest planting throughout the world. England, suffering from the loss of 1,000,000 acres of woodland during the World War, began actively planting on a large scale and establishing forest nurseries in various parts of England and Scotland. In the United States, not only the Federal government but many States and municipalities saw the wisdom of encouraging forest planting, and many private corporations in Canada and the United States engaged in various forms of lumber operation began planting on a large scale. New York and Pennsylvania developed State nurseries having an annual capacity of millions of trees for distribution.

**Forest Fires.** Fire, long conceded to be the most serious enemy of the forests, continued during this period to exact its enormous toll of timber from the nation. The newspapers and periodicals in directing attention to the fearful results of forest fires did much to present to the general public the seriousness of the situation and to warn tourists and hunters of the danger of careless practices. The first national fire conference ever held in the United States was convened at Sacramento, Calif., during the summer of 1921. All aspects of forest-fire control were discussed. Serious attempts made by both the Canadian and the United States governments to utilize the airplane as a means of controlling forest fires pointed to the probability that airplanes would be most effective in detecting rather than in subduing forest fires. Efforts were made to develop the radio as a means of communication in isolated areas. The Weeks Law, providing \$400,000 Federal funds annually to assist the States in fighting forest fires, aided materially in the reduction of loss. It was generally conceded by expert foresters that fire control is really the most vital factor in forestry, since all

efforts in replanting and improvement are cancelled by failure to suppress fires.

The value of effective fire protection was demonstrated in western Washington when, despite the destruction of 6,000,000,000 board feet of timber by a tornado which swept the west side of the Olympic Peninsula on Jan. 29, 1921, no fire losses were reported from the tangled mass of highly inflammable material. As a means of more effective coördination, there was organized in 1928 a national forest protection board composed of representatives of the Forest Service, National Park Service, Bureau of Indian Affairs, General Land Office, the Biological Survey, the Weather Bureau, Bureau of Entomology and Bureau of Plant Industry.

**Forest Experiment Stations.** Under the stimulus imparted by the consciousness of the rapidly diminishing forests, research received unusual consideration during the period subsequent to the War. That there was a significant awakening was concretely manifested in the establishment of a series of new Federal forestry stations as follows: Southern, New Orleans, La., 1922; Appalachian, Asheville, N. C., 1922; Northeastern, Amherst, Mass., 1923; and Lake States, St. Paul, Minn., 1923. Pacific Northwest, Portland, Ore., 1924; Ohio-Mississippi Valley, Columbus, O., 1927; Allegheny, Philadelphia, Pa., 1928. The immediate purpose of these new research institutions is to develop better methods of handling the existing forests and to encourage the reforestation of vast cut-over lands now idle, which only a few decades ago were covered with a splendid growth of forests. The cut-over land problem is particularly acute in the Lake States region, where aspen and scrub oak have succeeded noble stands of pine.

**Pulpwood.** The replacement of the enormous quantities of wood used in the manufacture of paper and paper products presents a problem of national scope, and one that grows increasingly acute. Realizing the seriousness of the situation, the U. S. Department of Agriculture Forest Service studied the possibility of growing more pulpwood and also of utilizing species which hitherto had been considered useless. Some progress has been made in developing means of converting corn stover into paper.

The decline in the forest resources of the mainland of the United States created interest in other possible sources of supply, notably Alaska. Figures presented in the 1921 report of the United States Forester, indicated that the national forests of that territory comprise 20,000,000 acres, containing an estimated stand of 75,000,000,000 board feet of usable timber. Fortunately, the national forests of Alaska represent 85 per cent of the Territory's lumber supply. In order to encourage the rational use of Alaskan timber, the Federal Forest Service offered inducements to reliable corporations to establish pulp mills in the national forests, on a basis of permanent production. Contracts were completed in 1927 whereby two large tracts near Juneau and Ketchikan were opened to development by private corporations working under carefully guarded provisions.

**Insects and Disease.** Not fire alone, but insects and diseases exacted a heavy toll from the forests of the United States and of all the world during the period ended 1928. Perhaps the most insidious enemy of all was the chestnut blight, which, gaining a foothold on the Atlantic coast of the United States, practically eliminated

the chestnut from the eastern United States forests. The white-pine blister rust, long an enemy of the white-pine forests of the eastern United States, became established in the western white-pine forests of British Columbia, Washington, and northern Idaho. The gipsy and brown-tail moths continued their slow but menacing spread throughout New England forests. The tremendous areas involved in forest-pest control rendered suppressive measures exceedingly difficult. Experiments with airplanes as distributors of poisonous dusts gave promising results.

**Land Classification.** The agricultural depression following the War forced the attention of thinking agriculturists, foresters, and business men to the considerable amount of land in the United States which, though utilized for agriculture, was for the time being of essentially greater value for the growing of forest trees. The Secretary of Agriculture named a committee to classify the lands of the United States according to their probable value in the effort to prevent the vain and futile attempts of pioneers to establish homesteads on land primarily unfitted for agriculture.

**Miscellaneous.** The organization in 1920 of the British Empire Forestry Association, connecting all the scattered units of the vast Empire, was a very progressive move. In addition, the publication of a quarterly journal by the association, the first number of which appeared in March, 1922, has helped to promote friendly relations between the various units of the service. The *Journal of Forestry*, published by the Society of American Foresters, continued to develop as an important medium for the exchange of thought and knowledge on American forestry problems. Steady progress was made by the leading forestry schools in strengthening their research and teaching staffs and improving their curricula.

**Bibliography.** The growth of scientific forestry in the United States was indicated by the appearance of an unusual number of books relating to fundamental subjects. The more significant are F. Roth, *Michigan Manual of Forestry*, 2 vols. (Ann Arbor, Mich., 1914 and 1916); H. H. Chapman, *Forest Valuation* (New York, 1915); J. W. Toumey, *Seeding and Planting* (New York, 1916); R. C. Hawley and A. F. Hawes, *Manual of Forestry for the Northeastern United States* (New York, 1918); H. H. Chapman, *Forest Mensuration* (New York and London, 1921); K. W. Woodward, *The Valuation of American Timberlands* (New York and London, 1921); R. Zon and W. N. Sparhawk, *The Forest Resources of the World* (New York and London, 1923); S. J. Record and C. D. Mell, *Timbers of Tropical America*, (New Haven and London, 1924); H. H. Chapman, *Forest Finance* (New Haven, Conn. 1926); E. P. Stebbins, *The Forests of India*, vol. iii, (London, 1926) J. W. Toumey, *Foundations of Silviculture upon an Ecological Basis*, (New York, 1928).

**FORMAN, HENRY JAMES** (1879- ). An American author and editor, born in Russia. He was educated at Harvard and at the École des Hautes Études Sociales, Paris. He was attached to President Roosevelt at the Russo-Japanese Conference as a special correspondent. Earlier in his career, he was literary editor of *Appleton's Magazine* and political editor of the *Literary Digest* (1905-06), associate editor and general manager of the *North American Review* (1906-10), a member of the editorial staff of

*Collier's Weekly* (1913-14), its managing editor (1914-18), and United States propaganda agent abroad (1918-19). His works include *In the Footprints of Heine* (1910), *The Ideal Italian Tour* (1911), *London—An Intimate Picture* (1913), *The Captain of His Soul* (1914), *Fire of Youth* (1920), *The Man Who Lived in a Shoe* (1922), *The Enchanted Garden* (1923), *Guilt* (1924), *The Pony Express* (1925).

**FORMOSA, or TAIWAN.** An island in the western Pacific belonging to Japan; area 13,830 square miles; population, in 1926 3,923,752 as compared with 3,341,217 in 1910. The Japanese increased from 50,000 to 195,769. The great mass of the population thus remained Chinese. The chief town, Taihoku, had 195,555 inhabitants in 1925 as against 95,000 in 1910.

**Industry and Trade.** Rice production is the chief agricultural pursuit, its yield (two crops) in 1927 being 12,444,614 hectolitres. Sugar, tea, jute, and sweet potatoes are other important products. The production of camphor through a government monopoly was 479,204 tons in 1926. A greater application to the natural resources showed itself in increased returns from mining. The total value of minerals, principally coal, gold, copper, and silver, was 14,627,334 yen in 1925; in 1913, it was 4,015,102 yen. Japan continued to absorb the greater part of the Formosa trade, though China and the United States occupied fairly important positions. Discounting the unfavorable years of the World War, the advance was consistent. In 1914 imports from foreign countries totaled 13,013,937 yen and from Japan, 39,879,148 yen; in 1927 imports were 65,840,396 yen from foreign countries, 121,107,991 yen from Japan; exports, 44,597,707 yen to foreign countries; 202,078,577 yen to Japan. Means of inland communication have been pushed. Railroad mileage increased from 290 miles in 1913-14 to 518 miles of government line and 1327.1 miles of private line in 1927.

**Government and History.** Under Japanese administration, the island's welfare improved materially. From the point of view of civil liberties, however, it must be recorded that the government remained absolute. The cost of administration has mounted. In 1913-14 expenditures were 44,473,781 yen; in 1928-29 (estimate), 109,246,000. Receipts were derived from inland taxes, customs, public undertakings, and Japanese subsidies (from 5,000,000 to 9,000,000 yen annually). Monopolies were maintained over camphor, salt, tobacco, opium, sake, and other spirits. As a result of this action, the use of opium gratifyingly fell off.

**FÖRSTER, E(DWARD) M(ORGAN)** (1879- ). A British author, who was educated at Tonbridge and King's College, Cambridge. His novels were *Where Angels Fear to Tread* (1905), *The Longest Journey* (1907), *A Room With a View* (1908), *Howard's End* (1910), *A Passage to India* (1924), awarded the Prix Femina-Vie Heureuse and the James Tait Black Prize, and *The Eternal Moment* (1928). Other works include *Alexandria, a History and a Guide*, *Introduction and Notes to the Letter of Mrs. Eliza Fay*, *Anonymity*, *An Enquiry*, and *Aspects of the Novel*, Clark Lectures, (1927).

**FÖRSTER, für'stär, FRIEDRICH W.** (1869- ). A German pacifist and social philosopher, born at Berlin. He studied philosophy, sociology, and political economy at the univer-

sities of Berlin and Freiburg. After teaching philosophy at the Zurich Polytechnikum, he became in 1912 professor of philosophy at the University of Munich. He resigned his chair in 1920 and retired to Switzerland. Förster opposed the German government's policy all through the World War. After the Armistice, he became one of the spiritual leaders of the new Germany. In the manner of the idealistic philosophers of classical Germany, he published an appeal to the people's conscience. In his *World Politics and World Conscience* (*Weltpolitik und Weltgewissen*, 1919), he made a penetrating attack on the policy which Germany had followed since 1870. He pleaded for the return to pacific federalism. From Switzerland he published an autobiographical account of his long struggle with German militarism (*Mein Kampf gegen das Militarismus Deutschlands*, 1920). Förster's other works include *Technik und Ethik* (1905); *Schule und Charakter* (1907); *Sexualethik und Sexualpädagogik* (1907; English translation, *Christianity and Sex*, 1908); *Christentum und Klassenkampf* (1908); *Autorität und Freiheit* (1910); *Schuld und Sühne* (1911); *Politische Ethik und Politische Pädagogik* (1919); *Christentum und Pädagogik* (1920); *Angewandte politische ethik* (1922, 2d ed., 1924); and *Franco-German Reconciliation* (1923).

**FORSYTH, ANDREW RUSSELL** (1858- ). A British mathematician (see Vol. IX). He became professor emeritus of mathematics at the Imperial College of Science and Technology in 1923. His later works include *Calculus of Variations* (1927). He also edited Cayley's *Collected Mathematical Papers* and Burnside's *Theory of Probability* (1928).

**FORT, PAUL** (1872- ). A French poet, born in Rheims; who continued the tradition of the symbolist school of the eighties and nineties. His verse style was a sort of rhythmic prose without any of the ordinary transpositions. His works, largely published as sub-titles in a series entitled *Ballades Françaises*, include *Montagnes, Forêts, Plaines, Mers; Le Roman de Louis XI; L'Amour Marin, Les Nocturnes; Réponse de l'Aube et de la Nuit; Coqcombe, ou l'Homme tout Nu Tombé du Paradis; Vivre en Dieu; Deux chaumières au pays de l'Yveline* (1916); *Poèmes de France* (1916); *La lanterne de Proust* (1918); *Chansons à la Gauloise* (1919); *Élène en fleur et Charlemagne* (1921); *L'arbre à poèmes* (1922); *Louis XI, curieux homme* (1922); *Les Compères du roi Louis* (1923); *Ysabeau, chronique de France* (1924); *Le camp du drapeau d'or* (1926), and *L'or Ruggieri* (1927), all plays; *La Tourangelle* (1925); *Fantômes de chaque jour* (1925), and, with Louis Mandin, *Histoire de la poésie française depuis 1850* (1926). Consult *Six French Poets*, by Amy Lowell (1915), *Selected Poems and Ballads of Paul Fort*, translated by J. S. Newberry with an appreciation of Carl Sandburg (1921), and *Paul Fort, sa vie, son œuvre*, by G. A. Masson (1922).

**FORTESCUE, SIR JOHN WILLIAM** (1859- ). A British historian who was librarian at Windsor Castle (1905-26). He received honorary degrees from Edinburgh and Oxford Universities, and was made Knight Commander of the Royal Victorian Order in 1926. His works included *History of the 17th Lancers* (1895); *Dundonald* (1896); *The Three Pearls* (1916); *History of the British Army* (12 vols., to 1859; 1899-1921); *My Native Devon* (1924); *Wellington* (1925); *Six British Soldiers* (1928); *His-*

*torical and Military Essays* (1928); and *The Empire and the Army* (1928). He edited *The Correspondence of King George the Third, 1760-1788* (6 vols., 1927-28); *The Recollections of Rifleman Harris* (1928); *The Note-Books of Captain Coignet* (1928); and *The Life and Adventures of Mrs. Christian Davies*, by Daniel Defoe (1928).

**FORT WORTH.** A city of Texas and an important grain, meat-packing, and oil-refinery centre. The population rose from 73,312 in 1910 to 111,536 in 1920 and to 170,600 in 1928 by estimate of the Bureau of the Census. The area of the city was considerably enlarged by the annexation of a closely built-up territory at the outskirts. In 1925 the city-manager plan of government became effective. During the World War, Camp Bowie and three flying fields were built close to the city. Shortly afterward, the discovery of oil fields near by brought increased activity, and by 1928 the value of petroleum products turned out by the nine refineries in the city was \$54,000,000 annually. The United States helium-gas plant, costing \$5,000,000, was established at Fort Worth, and the city was named one of the four stations for dirigible airships. The dam across Trinity River, begun in 1913, was completed, and on the lake so formed a municipal bathing beach was opened in 1917. A filtration plant was also built. Several large office skyscrapers and many minor buildings were erected, and in the area that had been Camp Bowie, 3500 houses were built. In 1928 building permits reached nearly \$20,000,000. The assessed valuation of property in 1927 was \$164,938,000; the net debt was \$19,803,000. In 1925 industrial plants gave employment to 6968 persons who received \$8,492,000 in wages. The value of products was \$100,329,000.

**FOSDICK, HARRY EMERSON** (1878- ). An American clergyman and professor, born at Buffalo, N. Y., and educated at Colgate University, Union Theological Seminary, and Columbia University. He was ordained to the Baptist ministry in 1903, holding a pastorate at Montclair, N. J., until 1915, when he was named professor of practical theology in the Union Theological Seminary, in New York City (where he had been instructor in homiletics since 1908). He became pastor of the Park Ave. Baptist Church of New York in 1927, having previously served for several years as preacher for the First Presbyterian Church of that city. In 1920 work was in progress upon the new Riverside Church, New York, of which Dr. Fosdick was to become pastor. His works include *The Manhood of the Master* (1913); *The Assurance of Immortality* (1913); *The Meaning of Prayer* (1915); *The Challenge of the Present Crisis* (1917); *The Meaning of Faith* (1917); *The Meaning of Service* (1920); *Christianity and Progress* (1922); a Spanish translation of one of his books, as *La Personalidad del Divino Maestro* (1923); *Twelve Tests of Character* (1924); *The Modern Use of the Bible* (1924); *Adventurous Religion* (1926); *Spiritual Values and Eternal Life* (1927); *A Pilgrimage to Palestine* (1927).

**FOSTER, BEN (JAMIN)** (1852-1926). An American landscape painter (see Vol. IX). In his later works, among which may be mentioned "Late Summer Moonrise," "Litchfield Hills," "Hazy Moonrise," and "From Hill to Hill," his interest in the misty effects of dawn and twilight and moonlit nights was still conspicuous. In 1917 he was awarded the Altman Prize, Na-

tional Academy of Design, and the gold medal and prize, awarded by the National Arts Club.

**FOSTER, SIR GEORGE EULAS** (1847- ). A Canadian public official (see VOL. IX). In 1916 he was a representative of the British government at the Economic Conference in Paris. After the Armistice, he was Canadian representative at the Peace Conference (1919), at the first assembly of the League of Nations in 1921, of which he was elected a vice president, and at the seventh assembly (1926). His publications include *Citizenship* (1926).

**FOSTER, JEANNE ROBERT (MRS. MATLACK FOSTER)** (1884- ). An American editor and author, born at Johnsbury, N. Y., and educated at Boston University, in Harvard courses, and the Stanhope-Wheatcroft Dramatic School in New York. After various newspaper experience, she became literary editor of the *Review of Reviews*, 1910-22. She was also American editor of the *Transatlantic Review*. Her works include *Wild Apples* (1916), *Neighbors of Yesterday* (1916), and *Rockflower* (1922); all of these are poetry. She edited the *John Quinn Letters* (1925).

**FOSTER, MAXIMILIAN** (1872- ). An American author born in San Francisco and educated at Andover Academy (Mass.). His career started in the newspaper field, which he abandoned for magazine work. Since 1902 he has published several plays and novels, which include *Keeping Up Appearances* (1911), *The Whistling Man* (1913), *The Trap* (1920), *The Silent Partner* (1923), *Humdrum House* (1924), *I Want to Be a Lady* (1926), and various motion-picture plays. During the World War, he was official correspondent for the United States government in France.

**FOSTER, WILLIAM TRUFANT** (1879- ). An American educator (see VOL. IX). He resigned from the presidency of Reed College in 1920 and accepted the directorship of the Francis D. Pollak Foundation for Economic Research (1920- ). He wrote *Should Students Study?* (1917). With Waddill Catchings he wrote: *Money* (1923), *Profits* (1925), *Business Without a Buyer* (1927), and *The Road to Plenty* (1927).

**FOUGNER, G. SELMER** (1884- ). An American journalist, born in Chicago, Ill. He was educated at the Sorbonne, Paris, and began his newspaper career as a member of the editorial staff of the *Paris Herald* (1906-09). He was later with the *New York Press* (1909-12), the *New York Sun* (1912-17), London correspondent for the *New York Sun* (1915), manager of the Press Bureau of New York for the Liberty Loans (United States Treasury, 1917-20), director of newspaper publicity for the second, third, fourth, and fifth loans, and for many organizations and committees of the World War. He directed the publicity of the New York Republican campaign for the Governorship in 1926. He also edited *Paper, The Publisher's Guide*, and *L'Exportateur Américain*.

**FOULKE, WILLIAM DUDLEY** (1848- ). An American civil-service reformer (see VOL. IX). In September, 1923, he was head of a delegation which visited President Coolidge and urged reform of the methods of appointing postmasters. In 1923-34 he was president of the National Civil Service Reform League. He wrote: *A Hoosier Autobiography* (1922); *Is Our Civilization Really Declining?* (1923). A

*Random Record of Travel During Fifty Years* (1925); *Roosevelt and the Spoilsmen* (1925); *Songs of Eventide* (1928).

**FOULOIS, BENJAMIN DELAHAUF** (1879- ). An American army officer, born in Connecticut. He enlisted in the Army as private, became 1st lieutenant in the Signal Corps in 1908, and in 1914 was appointed captain of the Aviation Section of that Corps. From that time he was constantly on aviation duty and was the senior military aviator in the point of service. He commanded the air-service troops on the Mexican border in 1916-17 and in 1917-18 was Chief of the Air Service, A. E. F. He was the American member of the Aviation Committee of the Supreme War Council from 1917 to 1919, in 1920-21 was assistant military observer for the American Commission at Berlin, Germany, and in 1921-24 served as assistant military attaché to the American Embassy at Berlin. He was promoted to be brigadier general in the Signal Corps in 1917, was appointed commanding officer of Mitchel Field, N. Y., in 1925, and assistant chief of the Air Corps in 1927.

**FOUNDATIONS.** The interval since 1914 has not witnessed striking developments in the method of constructing foundations, though there were naturally many improvements in the organization and execution of the work, due to better appliances and incidental improvements. There naturally has been a tendency toward the more extended use of steel or concrete-steel in many cases where wood was formerly used. In foundation construction, reinforced concrete has become an indispensable construction material. The foundation work of the most important character has to do with bridge piers and with large office or public buildings, such as hotels, state or municipal buildings and opera houses.

In modern building construction, the foundation not only supports the skeleton steel frame which with modern construction is constantly increasing in height, but also has to be considered in connection with the increased space in the basement and cellars for machinery for various purposes. As a result, there are involved not merely the piers to carry the main columns of the structure, but also a continuous exterior wall which not only serves as a foundation for the exterior columns but also acts as a retaining wall or coffer dam to resist the pressure of soil or soil and water on the outside of the wall and permits the cellar excavation to be carried below water level. A typical instance of such modern construction was shown in the Federal Reserve Building completed in New York in 1924, where 2,910,000 cubic feet of space, or 182,000 square feet of floor area was provided below curb level for machinery, vaults for securities, storage of various kinds and other general purposes. The deepest pier in this building went down 118 feet below the high curb on Nassau Street and the deepest floor was 80 feet below the same level.

In bridge foundation construction, there have been several notable works since 1914. One of these comprised the anchorages and piers for the suspension bridge across the Delaware between Philadelphia and Camden. An essential element of the Camden anchorage was two reinforced concrete cribs, each 40 feet by 140 feet in plan, which were sunk through silt, sand, and gravel of the river to rock 110 feet below high-water level on the Delaware River. For the river piers, pneumatic caissons were employed which

were fitted with horizontal locks and galleries in the body of the pier so as to afford safety and more convenient access to the working chamber. These pneumatic caissons were built of steel and reinforced concrete 70 feet by 180 feet, and were sunk to a depth of over 75 feet. This did not show a very striking development either in size or method, as the caisson for the New York and Brooklyn suspension bridge, though made of timber, was 172 feet by 102 feet, while that for the Eads Bridge at St. Louis was of boiler plate, 60 feet by 82 feet, both of which works were built a half-century ago.

It has been claimed that in building the piers for the Carlton Railroad-Highway Lift Bridge over the Kennebec River at Bath, Maine, the astounding and long-standing record made in sinking the caissons of Ead's St. Louis Bridge over the Mississippi in 1873 was broken. The east pier of Ead's Bridge was carried down 115 feet below water level, but even this record was surpassed in the east abutment which went down 130 feet below high water. The pier caissons at Bath reached depths of 114.3, 118.3 and 123 feet below high tide. On Ead's Bridge, however, there were 600 men in all employed at various times in the compressed-air work sinking the huge caissons. The air pressure reached 60 pounds per square inch, and it is said the gauge was then removed and there is no record of the highest pressure. Fourteen men died of caisson, or compressed-air disease and there were 119 cases of the malady in all.

At the present time, however, a great deal of compressed-air practice has been standardized, an important addition to the modern caisson being a patented excavating lock through which an ordinary bucket could pass in and out of the compressed air without being detached from the hoisting rope. Improved air compressors are employed. However, most of the improvements in caissons for deep foundations involved such adjuncts as telephones and electric lights in the working chamber, and a better understanding of the physiological effects of compressed air. There was also developed the use of the hospital lock so that the workmen were better protected and less exposed to danger, notwithstanding the fact that their employment under conditions of air pressure was regulated and restricted by local statutes or ordinances. Thus, on the Bath Bridge, a pressure reaching 50 pounds per square inch was used with no difficulty.

Another foundation method first employed on a large scale in sinking the piers for the Poughkeepsie cantilever bridge in 1886, has been recently used on two notable works. At Poughkeepsie there was 100 feet depth of water, and rock was 140 feet below water level. The open dredging process was used. Open caissons divided into a number of compartments were floated to position and sunk in place. Excavation was carried on under water through the open wells, the river bottom being removed by a clam-shell bucket. After completing the excavation, the caisson is solidly filled with concrete. In 1927 unexpected difficulty was encountered in sinking the east pier for the Mid-Hudson suspension bridge just below the Poughkeepsie cantilever bridge. The work was being carried out by the same method, open dredging, but at one time the east caisson was as much out of plumb as  $43\frac{1}{2}$  degrees. In July, 1928, it was finally righted and work again resumed.

In the Carquinez Straits Bridge, crossing an arm of San Francisco Bay and completed in 1927, the fourth largest cantilever in the world, the same open dredging process was employed and a record depth, either close to that at Poughkeepsie or slightly over it, of 132 feet was attained.

Certainly one of the most remarkable pieces of bridge-pier work recently carried out was the foundation construction for the west pier of the great Hudson River suspension bridge. Borings showed rock sloping off steeply from the shore. At the west or shoreward edge of the piers (there are two piers side by side 89 by 98 feet in size and 153.5-ft. centres) rock averaged 39 feet below mean high tide, while at the east or river edge the depth averaged 68 with a maximum of 76 feet. Such depth would usually be reached by pneumatic caissons, but in this case a huge steel sheet-piling cofferdam, with double walls on three sides and of course requiring very heavy interior bracing, was used. The entire excavation was unwatered, the rock surface cleared off and the masonry tower footings were built in the dry. This is probably the largest and deepest bridge-pier work ever undertaken by the cofferdam method.

Pile foundations, of course, continue to be extensively employed. The modern tendency in using piles is to substitute those of concrete for timber piles, and several types of the former are being used extensively. One leading advantage is that the concrete pile when properly made is absolutely permanent under practically all conditions of use including both wet and dry service. Obviously, their use did away with the possible danger of decay in case of water level below the cut-off level which was likely to happen under conditions where much subterranean construction acts to alter the natural water level. The simplest form of modern pile is one of reinforced concrete which has been cast and seasoned before driving and is used in the same manner as one of timber. There was also developed a steel shell and driving mandrel which was left in the ground and acted as a form in which the concrete could be poured. Still another type was a pipe which was closed at the bottom by a loosely fitting cast-iron point. This pipe was sunk in the ground and then after being filled with concrete was removed, leaving the concrete pile and the point in the ground. Another system employed an open pipe which was driven in the ground and the material inside excavated by using a jet of compressed air. The vacant space thus formed could be filled with concrete, both pipe and concrete filling being left in the ground. For driving such pipes, a hydraulic jack was employed and the method was found to be particularly useful in underpinning buildings.

**FOUNDATIONS, EDUCATIONAL.** See UNIVERSITIES AND COLLEGES.

**FOURTEEN POINTS.** See WORLD WAR, DIPLOMACY OF THE, under *War Aims*.

**FOWLER, CHARLES EVAN** (1867- ). An American engineer, born in Bartlett, Ohio. He studied engineering at the Ohio State University and in 1886 began active practice. He designed and built many important railroad and other bridges and was consulting engineer for the Williamsburg Bridge in Manhattan. He planned the Detroit suspension bridge (1920-21), the arch bridge at Sydney, Australia, and the 24-mile causeway over Lake Ponchartrain

at New Orleans, La. He also built many large plants and performed other work in Manila, Mexico, Cuba, and cities of the United States. He was a member of several scientific engineering societies and wrote much on building construction, including *Engineering and Building Foundations* (1919); *World Ports and Harbor Data* (1921).

**FOX, DIXON RYAN** (1887- ). An American historian and professor, born at Potsdam, N. Y., and educated at Columbia University. He was assistant professor of history there, 1919-22, associate professor, 1922-27, and professor since 1927. His works include *Decline of Aristocracy in the Politics of the United States* (1919); *Historical Atlas of the United States* (1920); an *Outline of Early American History* (1922); *Herbert L. Osgood, an American Scholar* (1923); *Caleb Heathcote, Gentleman Colonist* (1926). With A. M. Schlesinger, he edited *A History of American Life* (1928).

**FOX, FONTAINE (TALBOT, JR.)** (1884- ). An American newspaper cartoonist born in Louisville, Ky., best known for his creation of "Fontaine Fox's Funny Folk," "Fontaine Fox's Cartoons," "The Toonerville Trolley," all collected in book form, and many other cartoons. He was connected with the Wheeler Syndicate from 1915 to 1920, with the McNaught Syndicate, 1920-25, and since 1925 has been with the Bell Syndicate, supplying humorous cartoons to about 250 newspapers.

**FOX, PHILIP** (1878- ). An American astronomer, born in Manhattan, Kan. He graduated from the Kansas State Agricultural College in 1897, and from Dartmouth in 1902, taking post-graduate courses in Berlin. After serving on the faculty of Dartmouth College, he became Carnegie research assistant at the Yerkes Observatory at the University of Chicago in 1903, and was instructor in astro-physics at the University of Chicago from 1907 to 1909, when he became professor of astronomy and director of the Dearborn Observatory at Northwestern University. He served in the World War as major of infantry, and as assistant chief of staff in the 7th Division. Professor Fox is the author of *Annals of the Dearborn Observatory* (vols. i and ii).

**FOX, WILLIAM** (1879- ). A motion-picture producer born in Hungary and brought to the United States in infancy. He began his career as a theatrical manager in Brooklyn in 1904 and became president of the Fox circuit of theatres and the Fox Film Corporation. He was one of the earliest moving-picture producers, beginning, like Zukor, with the "penny arcades" and gradually expanding his interests until he was maintaining studios in California and New York. In 1916 he began exhibiting in Europe. Soon he was showing his pictures in many countries. His best-known productions include *Les Misérables*, *Tale of Two Cities*, *Romeo and Juliet*, *A Daughter of the Gods*, *Salome*, *Oleopatra*, *Evangeline*, *Over the Hill*, *The Queen of Sheba*, etc. He did excellent work assisting the Red Cross organization in its drives during the World War.

**FRAENKEL, frēn'kel, SIOMUND** (1868- ). Austrian biochemist, known for his exhaustive works. Born in Krakau, he received the degree of M.D. from the University of Vienna and was appointed professor extraordinary of medical chemistry there. His *Arzneimittelsynthese*, devoted to the synthetic medical drugs and the

relations between chemical constitution and physiological action, appeared in 1901, and has gone through several editions and a translation into English. *Descriptive Biochemie* appeared in 1907, *Dynamische Biochemie* (1911), *Praktikum der Medizinische Chemie*, (1918), and *Arzneimittelsynthese* (1927).

**FRAMPTON, SIR GEORGE JAMES** (1860-1928). An English sculptor (see Vol. IX). He was made a member of the Royal Academy of Belgium (1926). Among his later works, marked by the decorative quality and fine modeling that distinguish his productions, were the Edith Cavell Memorial, London, the statues of Queen Mary for Victoria Memorial Hall, Calcutta, and for Government House, Delhi, and the portrait busts of King George and Queen Mary for the Guildhall.

**FRANCE.** A country of western Europe, bordered on the south by the Mediterranean Sea and Spain, on the east by Italy, Switzerland, and Germany, on the north by Belgium and Luxemburg, and the English Channel, and on the west by the Bay of Biscay and the Atlantic Ocean. Since the Treaty of Versailles, its territory has been increased by the addition of Alsace and Lorraine, which had been in the possession of Germany since 1870. Before the World War, France was divided for administrative purposes into 87 departments (including the territory of Belfort, the remnant of the Haut-Rhin department left to France after the Franco-Prussian War of 1870). The Treaty of Versailles in 1919 restored Alsace-Lorraine to France, adding the three departments, Haut-Rhin, Bas-Rhin, and Moselle. The area of France was 207,054 square miles in 1913, and was increased, by the restoration of Alsace-Lorraine, to 212,659 square miles. The population of France (the old area) in 1911 was 39,604,902, with a population density of 191 persons to the square mile, but War losses brought the population in 1921 down to 39,209,518, with an average density of 184 to the square mile, in spite of the new territories added, which had in 1921 a population of 1,709,740, with a density of 305 to the square mile. The population in 1927 was estimated at 40,990,000 and the density in 1926 at 191.5 per square mile.

About 55,657,000 acres were devoted to crops in France in 1926, this representing 26.4 per cent of the total land area (136,101,760 acres); 27,669,000 acres were used for permanent meadow and pasture; 5,919,000 for trees, shrubs, and bushes; 25,587,000 were covered by woods and forests; and 11,741,000 acres were waste and uncultivated land.

**Population.** The capital and largest city of France, Paris, had a population of 2,906,472 according to the census of 1921 and in 1926 of 2,871,429. The Department of the Seine, which comprises Paris and its suburbs, had a population of 4,628,037 in March, 1926, in an area of 185 square miles. Other important cities are Marseilles (population 652,196 in 1926), the chief Mediterranean port and in most respects the leading port of France; Lyons (population 570,840 in 1926), the centre of French silk manufacture, at the confluence of the Rhone and Saône rivers; Bordeaux (population 256,026), the chief port of southwestern France, the outlet of the Garonne Valley; Lille (population 201,921), textile and industrial city of northern France, before the War one of the most rapidly growing French cities; Nantes (population 184,

509), on the Loire River near its mouth, the outlet for the valley of central France; Toulouse (population 180,771), an inland city on the upper Garonne River, in the centre of an important agricultural and viticultural region; St. Etienne (population 193,737), an important centre for silks, ribbons, and other industries; Strasbourg (population 174,492), formerly in German territory, an important river port and manufacturing city on the Rhine; and Le Havre (population 158,022) at the mouth of the Seine, a port of entry for Paris, of rising importance.

The population of France, even in times of peace, tends to increase with extreme slowness. Several years in the period before the War showed excess of deaths over births; for instance, those of 1890, 1891, and 1892, and 1911. In 1920 and 1921 the birth-rate increased, the excess of births over deaths being 160,000 and 117,000, respectively. The average number of births from 1923 to 1927 was 758,213 and of deaths 689,204, the excess of births being 69,009. The average birth rate per 1000 inhabitants was 18.7 and the death rate 17. In 1928 there were 745,315 births and 675,110 deaths, or a surplus of 70,205 births over deaths. In 1927, 59,271 foreign workers came into the country under contract, and 89,982 such workers departed. Between 1923 and 1927, the excess of entrance of such workers over departures was 589,761.

There is no state religion in France, but the dominant faith is Roman Catholicism. The higher clergy in France included 17 archbishops and 70 bishops. In addition, there were 51,000 clergy of various grades. There were also a number of ecclesiastics teaching in the universities and in the Catholic institutions. Protestantism in France was represented chiefly by synodal Presbyterianism. The Protestant population of France was estimated at about 1,000,000. Judaism and Mohammedanism (the latter chiefly in Algeria) were also represented in France.

**Education.** Educational freedom is provided for by law in France. There are, consequently, a number of private schools maintained by individuals and associations, but all have to conform to national standards of learning and morality, and the state alone has the right to award diplomas and degrees, through examination of the aspirants. The public schools formed the bulk of the French educational system; together they made up the so-called Université de France, divided into three orders—primary education, secondary education, and higher education. The most elementary schools in France were the *écoles maternelles*, a sort of kindergarten; in 1912-13, there were 3976 of these schools, and in 1926-27 only 3690, due to the slowness of reestablishing schools of this type in the devastated regions; the number of pupils attending was 608,315 in 1912-13 and 303,652 in 1926-27. Next were the primary schools proper, numbering 83,095 with 159,982 teachers and 5,669,251 pupils in 1912-13, and 80,183 with 3,853,431 pupils in 1926-27. In 1912-13 there were 83 primary normal schools each for males and females, with 4629 male and 4959 female pupils; while in 1926-27, there were 85 normal schools for males with 5663 students, and 86 for females with 6702 pupils. Secondary education for boys was given in 343 schools in 1913 to 100,203 students and in 262 schools in 1927 to 115,096 students, while secondary education for girls was given in

138 schools in 1913 to 33,282 students, and in 205 schools in 1927 to 52,459 students. Higher education was given to 60,000 students in 1927 of whom 17,125 were under the law faculty, 11,182 students studying medicine, 12,820 science, and 13,343 letters. In 1929 there were 17 universities in France, at Aix-en-Provence, Algiers, Besançon, Bordeaux, Caen, Clermont-Ferrand, Dijon, Grenoble, Lille, Lyon, Montpellier, Nancy, Paris, Poitiers, Rennes, Strasbourg, and Toulouse. The oldest was the University of Paris, founded in 1200, the newest that at Algiers, founded in 1885. The only illiteracy statistics available for France were those in connection with conscription for the army. In 1912 the percentage of illiterate conscripts was 4.18 and in 1921 it was 4.07. In the earlier year, 7694 could neither read nor write, and in the latter year, 6600. In 1926, 9.44 per cent of the conscripts could not write.

**Agriculture.** France is preponderantly an agricultural country, notwithstanding the great importance of French manufactured products, but the proportion of rural inhabitants was steadily, though gradually, decreasing. According to the 1911 census, the rural population was 22,096,000 out of a total of 36,605,000, and according to the 1921 census, for the same area, the rural population was 20,119,000 out of a total of 37,500,000; for the new area of France in 1921, the rural population was 21,004,000 out of a total of 30,210,000. The proportion of persons actually engaged in agricultural work was slightly less; in 1911, the working population of France was 20,931,000, while the agricultural workers numbered 8,517,000. Thus, in 1911 the ratio of agricultural workers to total workers was 407 to 1000, and the ratio of rural population to total population 558 to 1000.

**Agriculture.** The following table gives a comparison between pre-war production and that for 1927. It will be noted that post-war acreage and production in most instances have not caught up with the pre-war figures.

Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1909-1913	1927	1909-1913	1927
Wheat	16,500	13,209	325,644	284,353
Rye	3,095	1,970	52,502	36,799
Barley	1,988	1,754	52,827	55,572
Oats	9,829	8,542	368,465	372,539
Potatoes	4,066	3,895	526,789	629,960
Sugar beets	612	545	5,937 <sup>a</sup>	5,573 <sup>a</sup>
Grapevines	4,017	3,393	1,326,821 <sup>b</sup>	1,300,399 <sup>a</sup>

<sup>b</sup> Unit, gallon of wine.

<sup>a</sup> Unit, metric ton.

The value of the principal crops in 1926 was as follows: wheat, \$374,812,000; oats, \$192,312,000; potatoes, \$265,022,000; grape wines, \$262,255. On Dec. 1, 1926, there were 14,482,000 cattle, 5,777,000 swine, 10,775,000 sheep, 1,388,000 goats, 2,894,000 horses, 185,000 mules, and 264,000 asses. The figures for 1913 were: horses, 3,222,000; cattle, 14,788,000; swine, 7,036,000.

**Fisheries.** The French fishing industry was greatly damaged by the War, not only by the requirement of fishermen for service in the army, but also by the requisitioning of boats and equipment. At the end of 1926, the number of vessels was only 23,648, in spite of increases since 1918, as compared with 29,451 in 1912. The number of steam and motor vessels is in-

creasing, but sailing craft (19,812) still predominate. The value of all fishery products in 1926 was placed at 1,057,567,000 francs, and the industry gave employment to 134,532 persons.

**Minerals and Industries.** The leading minerals produced in France are coal, iron, gold, lead, zinc, silver, copper, antimony, manganese, tungsten, bauxite, iron pyrites, mineral oils, salt potash, and stone of various kinds, but not all of these are produced in important quantities.

The accompanying tables give a comparison of representative post-war years with the pre-war year, 1913, for mineral and metal production and manufacturing industries:

MINERAL AND METAL PRODUCTION  
(Thousands of Metric Tons)

	1913	1923	1927
Coal and lignite	43,847	37,679	51,780
Coke (metallurgical)	4,027	4,287	4,068
Briquets	...	3,056	3,906
Iron ore	43,054	23,349	45,672
Iron pyrites	311	186	204
Potash (K <sub>2</sub> O content)	350	249	372
Bauxite	309	314	540
Pig iron	9,071	5,468	9,298
Steel (ingots and castings)	6,976	5,302	8,268
Iron and steel (finished products) *	3,592	3,321	...

\* 1913 is exclusive of Alsace-Lorraine.

NOTE.—Data for 1913 are for production within the present boundaries unless otherwise noted.

MANUFACTURING PRODUCTION

Product		1913	1923	1926	1927
Silk (conditioned at Lyon)	1000 lbs.	18,519	10,370	14,577	12,707
Wool (conditioned at Roubaix-Tourcoing)	1000 lbs.	204,525	212,250	223,884	229,049
Wool (conditioned at Mazamet)	do	59,842	52,619	46,006	58,387
Cotton cloth	1000 yds.	1,377,950	1,224,844	1,356,064	1,298,103
Artificial silk	metric tons	2,900	3,700	8,000	13,000
Boots and shoes (estimated)	1000 pairs	49,000	52,000	80,000	...
Alcohol	1000 gals.	78,036	47,225	39,217	...
Refined sugar *	metric tons	717,319	445,368	666,055	...
Vessels launched	1000 gross tons	176	97	111	42

\* Data are for seasons ended following year.

**Foreign Trade.** In 1927 the total value of French imports was 52,853,000,000 francs (\$2,073,952,000), as compared with 59,598,000,000 francs (\$1,932,258,000) in 1926 and 10,724,000,000 francs (\$2,070,000,000) in 1913. In comparing 1927 figures with those of 1913, the change in the value of the franc must be taken into consideration. Exports in 1927 were valued at 55,225,000,000 francs (\$2,162,729,000), as against 59,678,000,000 francs (\$1,935,178,000) in 1926 and 9,260,000,000 francs (\$1,787,000,000) in 1913. The weights of both exports and imports were much higher in 1927 than in 1926. The lower value in terms of francs resulted evidently from declines in French selling and buying prices abroad following the improvement in the exchange value of the franc. Imports of manufactured articles were lower both in value and volume in the later year. Imports of foodstuffs, particularly wheat, increased in value and weight, due, in a large measure, to the insufficient crops harvested during 1926.

That the visible trade balance was so favorable is traceable almost entirely to trade with the French colonies and protectorates. Imports from the United States, the largest suppliers, were valued at \$276,691,000 in 1927 as against \$256,698,000 in 1926. Of this total, 36 per cent was represented by raw cotton. Total exports to the United States in 1927 were valued at \$141,462,000, as compared with \$126,516,000 in 1926.

Lingerie and clothing made up approximately 13 per cent of the total export values.

In 1927 the United States supplied 13.3 per cent of the imports and purchased 6.5 per cent of the exports; Argentina, 4.4 and 2.1; Belgium, 7.0 and 13.7; Germany, 8.0 and 11.7; United Kingdom, 12.2 and 18.4; Algeria 4.8 and 7.1. The five leading imports in the order of value in 1927 were wool, cotton, wheat, coal, and wines; the five leading exports in similar order, silk fabrics, cotton fabrics, iron and steel, pearls, and wool and waste.

In contrast to the favorable trade balance of 1927, there was a heavy adverse balance in 1928, as the imports amounted to 53,448,265,000 francs and the exports to 51,346,799,000 francs. The imports in 1928 were classified as follows: foodstuffs, 12,549,775,000 francs; raw materials, 32,989,027,000 francs; and manufactured articles, 7,909,463,000 francs. The exports were: foodstuffs, 6,240,247,000 francs; raw materials, 13,077,023,000 francs; and manufactured articles, 32,029,529,000 francs. The trade with foreign countries as distinguished from that with the colonies and protectorates was responsible in large measure for the heavy adverse balance referred to. Imports from foreign countries were valued at 46,720,343,000 francs and exports at 43,022,282,000 francs. The value of imports from the French colonies and protec-

torates in 1928 was 6,727,922,000 francs, and of exports 8,324,517,000 francs. As in previous years, the United States was the principal supplier to France, followed by Great Britain, Germany, Belgium-Luxemburg, and Argentina in the order named. Great Britain was the heaviest buyer of French merchandise, followed by Belgium-Luxemburg, Germany, Switzerland, and the United States. French imports from the United States were valued at 6,200,346,000 francs and the exports at 3,331,481,000 francs.

**Reconstruction.** The population of the devastated region in the northern and eastern departments of France which totaled 4,790,000 in 1914, had fallen to 2,075,000 in 1918, but in 1928 had increased to 4,645,000. Out of the 1,258,053 dwellings and farm buildings, 866,844 were destroyed; by 1928, 641,011 had been reconstructed, the difference being due to concentration in building. For the same reason, only 8296 factories had been reconstructed, whereas 9332 out of 11,189 plants employing at least 10 workmen were destroyed. Of the 17,616 public edifices destroyed, out of 20,824 which existed in 1914, 14,756 had been rebuilt. Summing up, of the 1,290,066 buildings of all kinds, contained in the census of 1914, a total of 893,792 were destroyed; these had been replaced by 663,063 buildings which were much superior to the pre-war structures.

In 1914 this area had 2,236,227 hectares of land under cultivation, of which 1,922,479

hectares were damaged; 1,862,852 hectares, all that could be restored profitably, were again fit for cultivation. The number of live stock which was reduced almost to nothing was greater than before the war. Of 120,000 kilometers of roads, practically one-half were rendered unfit for use, and 2490 kilometers of main railway lines were destroyed; this damage was practically all repaired. The lines operated by the railways of local interest were longer than before the war, and the length of the navigable waterways also had been increased.

The developments regarding the mining industry are no less striking. In 1914 the coal mines of the Departments of Nord and Pas-de-Calais comprised 271 pits, 3399 kilometers of galleries, 1233 kilometers of track, and 220 machines for extraction of coal; the monthly production of coal averaged 2,260,000 tons. Though all the pits were destroyed in 1918, in 1928 the coal-mining facilities comprised 295 pits, 3788 kilometers of galleries, 1321 kilometers of track, and 236 machines for extraction; the average monthly extraction has increased to 2,706,000 tons. In the iron mines of the Briey and Longwy Basins, which were also destroyed, the facilities in 1928 were much better than formerly, and the output had increased much beyond the pre-war figure.

The work of restoration had included the filling in of 310,675,000 cubic meters of trenches, the clearing of 379,000,000 square meters of barbed wire, the destruction of 22,134,000 tons of munitions found underground, and the pumping out of 107,000,000 cubic meters of water in the coal mines and 10,218,000 cubic meters in the iron mines. The commissions for the evaluation of war damages had examined 3,092,884 demands and had rendered decisions covering indemnities totaling 77,752,750,000 francs. Of this amount the payments made covered 73,525,870,000 francs. It was estimated that the total indemnities due would reach 85,500,000,000 francs and that they would be entirely paid in 1930.

**Finance.** Before the War, French budgets had a practical balance of receipts and expenditures, though in some years expenses showed a greater or less excess. The accounts for the fiscal period, 1913 (i.e., amounts properly attributable to the year 1913, whether received or spent in that year or in 1914) showed revenues amounting to 5,103,000,000 francs and expenses amounting to 5,349,700,000 francs, with an excess of expenses amounting to 246,700,000 francs. The budget for the year 1914 provided for a slight surplus, but war expenses upset the calculations, and initiated the period of large budgets which have continued ever since.

The French budget for 1929 as finally passed on Dec. 30, 1928, varied very slightly from the proposals of the Government. Expenditures were fixed at 45,366,000,000 francs and revenues at 45,430,000,000 francs, leaving an estimated favorable surplus of 64,000,000 francs. These totals represented an increase of approximately 2,780,000,000 francs over the receipts and expenditures of the preceding year. In addition to the general budget, there were various annexed budgets, which for 1929 amounted to 6,233,674,000 francs. Each of the additional budgets included its own independent revenues, which, as a general practice, correspond exactly with the expenditures authorized. The following tables show proposed revenues and expendi-

tures by categories for 1929, with comparative figures for 1928:

REVENUES AND THEIR SOURCES IN THE FRENCH GENERAL BUDGET FOR 1929 (In millions of francs)		
Item	Estimated 1928	Proposed 1929
Direct and assimilated taxes	8,536	9,737
Registry taxes	3,760	3,712
Stamp taxes	1,850	1,898
Taxes on transactions on the bourse	391	347
Tax on securities	3,426	3,525
Luxury tax	21	24
Customs duties	3,677	4,227
Indirect taxes	6,568	6,181
Business turnover tax	8,562	8,509
Sugar and saccharin tax	1,135	1,081
Monopolies	532	557
Public domain	444	444
Reimbursements	2,050	2,181
Sundry receipts	1,186	2,553
Exceptional receipts	842	288
Amounts recoverable in Algeria	17	22
<b>Total</b>	<b>42,497</b>	<b>45,281</b>

EXPENDITURES IN THE FRENCH GENERAL BUDGET FOR 1929 (In millions of francs)		
Ministries	Estimated 1928	Proposed 1929
Finance	25,279	25,241
Justice	246	286
Foreign Affairs	236	245
Interior	736	888
War	6,031	6,815
Marine	2,451	3,091
Public Instruction and Fine Arts	2,585	3,091
Commerce and Industry (commerce and industry, aviation and air transports)	40 218	46 317
Labor, Health, and Social Welfare	959	1,234
Colonies	457	561
Agriculture	381	454
Public Works	2,034	2,180
Pensions	792	907
<b>Total</b>	<b>42,445</b>	<b>45,225</b>

Below are shown the amount and composition of the public debt on July 31, 1926, and Feb. 29, 1928.

FRENCH PUBLIC DEBT ON JULY 31, 1926, AND FEBRUARY 29, 1928 (In millions of francs)		
Allocation	July 31, 1926	Feb. 29, 1928
<b>INTERNAL DEBT</b>

<b>Total, political</b>	<b>155,711</b>	<b>161,400</b>
<b>Total, foreign debt</b>	<b>180,320</b>	<b>179,180</b>

\* The official figures for the foreign debt are given in gold francs at the old parity. In the above table, they have been converted into the new franc created by the law of June 24, 1928, by using the coefficient 4.917.

Probably the outstanding event of post-war French finance was the stabilization of the franc on June 25, 1928. Until that date, the franc was worth 19.3 cents. Actually, however, the franc had, since December, 1926, been worth approximately four cents, and, in previous years, had declined to two cents. Its fluctuations were many and varied and worked a great hardship on many persons, particularly the holders of securities yielding a fixed income in francs. The stabilization law created a new monetary unit, still called the franc, but defined as 65.5 milligrams of gold 0.900 fine, or slightly more than one-fifth the former weight. The gold parity of the franc is 25.52 francs to the dollar, which corresponds very closely to its exchange value at the time the law was promulgated.

Aside from budget deficits and the increase in the public debt, the chief reason for the depreciation of the French currency in 1924 was the large note circulation of the Bank of France, as compared with the metallic reserve. In 1913 the average metallic reserve of the Bank of France was 3,342,800,000 francs in gold and 629,300,000 francs in silver, making a total of 3,972,100,000 francs. The average note circulation of the bank in the same year was 5,665,300,000 francs, making the percentage of metallic reserve to note circulation just over 70. On Dec. 21, 1927, the gold reserve in the bank was 3,681,000,000 francs, that held abroad, 1,864,000,000 francs and the silver reserve 343,000,000 francs, making a total reserve of 5,838,000,000 francs. On the same date, the note circulation was 56,551,000,000 francs, and the percentage of metallic cover to note circulation

10½. On Jan. 11, 1929, the gold reserve of the bank had risen to 33,709,000,000 francs, as compared with 28,935,000,000 francs at the time of stabilization on June 25, 1928.

**Transportation.** France is well provided with means of communication, internally by means of railways, rivers, and canals, and externally by the same means and also through harbors and ports and with the help of an extensive merchant marine. The length of navigable rivers and canals in 1925 was 6796 miles with a total traffic of 37,105,000 metric tons.

The French railway system comprises six private lines and one state line with a total mileage open for traffic in 1928 of 25,947 miles. This mileage was comprised as follows: State, 5629 miles; Nord, 2378 miles; Est, 3121 miles; Paris-Orleans, 4651 miles; Paris-Lyons-Mediterranean, 6091 miles; Midi, 2652 miles; Alsace-Lorraine, 1425 miles. The total receipts of the seven systems for 1928 was 14,576,975,000 francs and for 1927, 12,996,071,000 francs. For the latter year, the operating expenses amounted to 10,903,100,000 francs and fixed charges to 2,680,900,000 francs, the deficit for the year being 321,700,000 francs. By 1928, 716 miles of French railway had been electrified in pursuance of a settled policy. The State Railway had 56 miles in the suburbs of Paris electrically operated; the Orleans Railway, 144 miles, including 127 miles of the Paris-Vierzon Railway; the Paris-Lyons-Mediterranean Railway 16 miles from Chambéry to St. Pierre d'Abigny; and the Midi Railway about 500 miles. Statistics of railways in 1913 and 1926 are given in the accompanying table:

## STATISTICS OF PRINCIPAL RAILWAYS

		1913	1926	State, 1926	Private, 1926
Length of line	miles	24,573	26,872	6,907	19,965
Locomotives	number	14,150	20,942	5,888	15,054
Passenger cars	do	31,504	36,108	11,303	24,805

Rouen		2,285	2,439	377	646

France had witnessed considerable growth of air traffic, mileage of airways having increased from 3556 in 1921 to 6000 in 1925 and the mileage flown from 1,460,000 to 3,000,000. The passengers carried in 1921 numbered 10,619 and in 1925, 19,708. Freight by airplane had increased from 577,000 lbs. in 1921 to 2,092,000 lbs. in 1925 and mail from 77,000 lbs. in 1921 to 1,963,000 lbs. in 1925. See AERONAUTICS.

**History.** On Dec. 1, 1913, the moderate Barthou cabinet was overthrown and was succeeded by a ministry formed by Gaston Doumergue, whose Radical-Socialist Party filled seven of the twelve seats. Joseph Caillaux was the directing genius of the cabinet, but was kept from the premiership by the stigma of the Morocco settlement of 1911. He was made Minister of Finance. In view of the forthcoming elections, the cabinet chose to concentrate on his financial proposals rather than on the delicate question of reducing military service from three to two years, at the time the central issue with the Radical-Socialists. On that issue, nevertheless, the Radical-Socialists and Unified Socialists cooperated to form a pacifist bloc, in clear-cut opposition to the Federation of the Left which Barthou, Millerand, and Briand had organized with a programme of electoral reform and the Three Years Law. In the latter part of March, 1914, both Caillaux and his lieutenant, Monis, Minister of Marine, were forced to resign because of the shooting of Gaston Calmette by Madame Caillaux and the subsequent revelation of an old financial scandal. Meanwhile, the electoral campaign was on, centering for the most part around the Three Years Law. In the May elections, the Radical and Socialist bloc more than held its own, but the Doumergue cabinet, in accordance with custom, resigned before the meeting of the new Chamber, and a ministerial deadlock ensued in which a Ribot cabinet was smashed by the Radical-Socialist bloc within 24 hours after its formation. Finally, René Viviani succeeded in forming a cabinet based on a national-defense policy which received the Chamber's support.

While the French public was deeply absorbed in the sensational trial of Madame Caillaux during the latter part of July, President Poincaré, accompanied by Premier Viviani in his capacity as Foreign Minister, set out to visit France's ally, Russia. The Kronstadt Conference brought a further cementing of the alliance between France and Russia. The French statesmen returned to Paris on July 29, just after the Austrian ultimatum had been delivered to Serbia. When war between Russia and Germany seemed unavoidable, the German government requested of the French government a definite answer as to the attitude of France in case of a Russo-German conflict. In view of her alliance with Russia, France felt compelled to answer that she "would consult her interests." Orders for mobilization were issued in France and Germany on August 1, and two days later, war was declared by Germany on France. See WORLD WAR.

The French people received the news with patriotic fervor. Their outward calmness was marred, outside of a few minor occurrences, only by the assassination of Jean Jaurès, the great Socialist and pacifist, on July 31 by Raoul Villain, who acted under the influence of the extreme Royalists. Confronted with a situation which called for the greatest efforts and

sacrifices, the parliamentary factions abandoned all partisan strife and concluded a truce, known as the "Union Sacrée," to which even the Socialists subscribed. The draining of man power from all walks of life took place without friction and a financial panic was averted by a moratorium. Measures were taken to provide for the maintenance of an adequate food supply, and a rigid censorship was imposed.

With the rapid German advance threatening Paris, Premier Viviani resigned on August 26 and formed a more representative cabinet. General Gallieni, a capable and resolute soldier, was appointed military governor of Paris, but the danger became so great that the government moved to Bordeaux on September 2 and returned only in December, 1914. When Parliament reopened in Paris on Dec. 22, 1914, Premier Viviani passionately declared that France would not lay down her arms until Alsace-Lorraine was regained, Belgium restored, and Prussian militarism broken. Parliament criticized freely the conduct of the war, especially the handling of medical and munitions supplies by Millerand, Minister of War.

The Viviani government, however, withstood all attacks until Oct. 22, 1915, when the failure of its Balkan policy brought its downfall. A new coalition government was formed, by Aristide Briand, which included members of practically all political parties. Reports of lack of provision in the defense of Verdun in the spring and summer of 1916 brought a very stormy secret session of Parliament July 16-22, but the Government withstood all attacks, and the Battle of the Somme and the great diplomatic success of securing Rumania's entrance into the War on the side of the Allies prolonged its life. In December, 1916, Briand reconstructed his cabinet, giving the Ministry of War to General Lyautey (q.v.) but when the Chamber shortly afterward drove Lyautey from office and severely criticized Briand's economic policy, the cabinet resigned, on Mar. 17, 1917. The succeeding ministry under Ribot differed from the outgoing ministry only in that it contained as Minister of War a Radical-Socialist, Paul Painlevé, who on May 15, 1917, made important changes in the army command by appointing General Pétain commander-in-chief, in place of General Nivelle, and General Foch chief of staff at the War Office.

During the spring and summer of 1917, the seemingly interminable duration of the War and the terrible losses and sacrifices, coupled with grave economic troubles, seriously affected the morale of the French people and produced widespread war-weariness. The symptoms of this state of mind were "defeatism," industrial unrest, and mutinies at the front. Socialists increasingly took a stand of opposition to the War. Caillaux and other Radical-Socialist leaders, who had always more or less openly opposed the French war policy, were carrying on a campaign for a "White Peace," i.e., a peace without victory. The situation became so critical during the summer of 1917 that immediate energetic action seemed imperative to prevent a breakdown. During August, Georges Clémenceau made a vehement attack in the Senate on Minister of the Interior Malvy for the way in which he permitted the spread of defeatism and pacifism. This brought about the fall of Malvy on Aug. 31, 1917, and a week later that of the entire cabinet. Paul Painlevé succeeded Ribot

as Premier on September 12 and inherited all the troubles that beset the holder of this office.

Upon the speedy fall of the Painlevé ministry, Clémenceau assumed office and began to clean the Augean stable of treason and of neglect. He abandoned coalition and the political dilly-dallying of his predecessors and declared that he would pursue but one policy, that of vigorously prosecuting the War. In pursuance of this policy, he assumed, aside from the Premiership, the Ministry of War as the all-important cabinet post and filled his ministry for the most part with men who had been little before the public eye but who stood out for ability and energy and were thoroughly faithful to his policy. He put a speedy end to the defeatist campaign by ordering the arrest of its more important leaders. At the end of 1917, the prosecution of Caillaux was ordered, and the arrest of this former Prime Minister and leader of the great Radical-Socialist Party took place on Jan. 14, 1918.

A series of treason trials now followed in rapid succession. On February 14, the adventurer, Bolo Pasha, was condemned to death for using German money to invest in French newspapers for defeatist purposes. Other trials resulted in the execution of M. Duval, editor of the defeatist newspaper *Bonnet Rouge*, and Pierre Lenoir, and the imprisonment of many others, while Malvy, lieutenant of Caillaux and Minister of the Interior in five successive cabinets, was sentenced to five years' exile for "negligence equivalent to treason." Caillaux himself was not brought to trial until the spring of 1920. He was convicted of giving the enemy material aid but was exonerated of having guilty intentions, and was sentenced to two years' imprisonment, which he had already served, loss of civic rights, and five years' residence in an assigned district. The importance of these treason trials lies in the fact that they marked the temporary conclusion of a struggle, started long before the War, between the policy which aimed at a Continental concert under French and German leadership and that which looked toward a military victory over Germany and an entente with England.

Having checkmated the anti-war elements, etc., Clémenceau set to work organizing all energy in the country to prosecute the War. He refused to follow his predecessors in the policy of deceiving public opinion and stated to the country the sombre truth as to the military and political situation. He supplied the weakened army with new soldiers by drastically draining offices, factories, and fields of dispensable manpower. At the same time, he instituted rigorous measures to ensure an adequate food supply. His rationing system had not, however, the same success which similar measures had in Great Britain and Germany because of the disinclination of the French people to submit to strict alimentary discipline. Clémenceau also dealt sternly with the Socialist and Syndicalist opposition which raised its head during the summer of 1918. French morale improved steadily notwithstanding severe trials, such as the Parisians experienced during the bombardment and air raids in the spring and the summer of the last year of the War. If the desired end, military victory over Germany, was finally achieved, it was in no small measure due to the iron rule of Clémenceau.

Immediately after the Armistice, the politicians made a determined effort to reestablish the cabinet system and to divest Clémenceau of that one-man power which he had exercised during the War and which had enabled him to hold the country together till the final victory. In opposition to such designs, Clémenceau made clear in the debates in the Chamber during November, 1918, that he had no intention of giving up his powers as peace-maker and that, outside of a general outline, he would not take the whole country into his confidence in regard to his peace policy. In this attitude, he was sustained by the Chamber by a vote of 398 to 93. Clémenceau conducted the peace negotiations (see PEACE CONFERENCE) in secrecy, aided not by eminent French politicians but by his own faithful and trusted collaborators. This caused considerable resentment in Parliament. Moreover, able as Clémenceau had been as War Premier and as peace negotiator, he had failed in his economic and labor policies. Extremist agitation and the failure of the Government to remedy economic distress, and particularly the high cost of living, brought about a number of serious strikes during the first half of 1919. When the Peace Treaty came up for discussion in the Chamber in September, 1919, the Left censured the spirit of harshness in which it had been conceived, while the Nationalist deputies maintained that it did not go far enough in providing France with security, especially since Germany was permitted to retain the left bank of the Rhine. A rejection of the Treaty being out of the question, it was finally ratified by 372 votes against 52.

Great interest centred in the elections of 1919, the first since 1914. With the aid of Alexandre Millerand, Clémenceau organized an electoral phalanx, the National Bloc, composed of the more conservative parties, to combat Socialism and Bolshevism. The elections to the Chamber, held on Nov. 16, 1919, resulted in a decisive victory for the National Bloc and in a defeat for the Socialists and the Radical-Socialists. The balance of power was shifted from the Left and the Left Centre to the moderate Centre and the conservative Right. Moreover, since the two parties which had hitherto opposed anti-clerical legislation, the Progressists and the "Action Libérale," made the greatest gains, the election signified, for the time at least, a Catholic revival. It was quite evident from the results that the election was an expression of the spirit of the War and not of peace. The most important business before the new Parliament was the election of a successor to Raymond Poincaré as President of the French Republic. Clémenceau, though not eager, was induced to stand for election, but was defeated by Paul Deschanel in the Republican Caucus ballot which was held before the election. Thereupon, the National Assembly chose Deschanel by 734 out of 888 votes on Jan. 17, 1920. On the following day, the Clémenceau Ministry resigned, and Alexandre Millerand formed a new cabinet, in the composition of which he followed Clémenceau's example of choosing men of practical experience rather than brilliant politicians.

The new Government was soon called upon to deal with very serious strikes which began in February, 1920. These were caused by extremist sections in the French labor movement and were unpopular with the great mass of the

French people; they failed disastrously by the end of May, dealing a severe blow to the *Confédération Générale du Travail*. The chief aim of the Millerand government was the application of the terms of the Peace Treaty, and toward this end Raymond Poincaré was appointed President of the Reparations Commission on February 20. The successive Conferences at Boulogne, Spa, and Hythe produced very few results. The unsatisfactory trend of the Reparations policy engendered no little discontent in Parliament and Millerand might have had to contend with very strong opposition had it not been for the success of his labor policy and of his Polish policy. In accordance with the French post-war policy of erecting Poland as a strong "buffer" state between Russia and Germany in order to prevent a union of interest between these two former Powers, the Millerand government during the summer of 1920 gave successful aid to Poland in its struggle with Soviet Russia. The national approval accorded to this policy made, in conjunction with other factors, Millerand the logical candidate for the Presidency when President Deschanel was forced to resign on account of illness on Sept. 16, 1920. Millerand accepted the candidature and issued a statement declaring that, if elected, he would continue the same policy which he had pursued while Premier. He was duly elected on November 26 by 695 out of 892 votes and immediately thereafter let it be known that he intended to increase the powers of the presidential office and to assume a greater control over foreign affairs than his predecessors had done. A new ministry was formed by Georges Leygues, but this cabinet was clearly intended as a makeshift and gave way in the middle of January, 1921 to a cabinet under Aristide Briand.

The return to power of the parliamentary veteran Briand marked a revival of government by coalition and an attempt to modify the French Reparations policy and above all improve the somewhat strained relations with England. Ever since the Peace Conference, there had been gradually increasing disagreement between France and Great Britain (q.v.) as to the application of the terms of the Treaty. The French interpreted the English counsel for moderation as an attempt to whittle down France's share after England had been fully indemnified by the German colonies, markets and ships. They reasoned, moreover, that the English could well afford to be lenient with the Germans since England as a result of the Allied victory had been secured against any possible German aggression, while France, situated on the continent, had to reckon with a rapid recovery of a neighbor possessed of great powers of recuperation. Whatever the merits of this contention were, it produced on the part of the French public and government a tendency to use the policy of the strong arm in continental European affairs and it brought discord into the Franco-British relations. This estrangement was also fostered by other points of divergence in policy, such as Franco-British differences in the Near East, notably in Syria; the conflict between the French pro-Turkish and the British anti-Turkish policy; the British negotiations for resumption of trade with Soviet Russia and the vehement opposition of the French to Soviet Russia because of the Poles and the Russian debt; the refusal of the British to follow the French in giving unconditional

support to the Poles in the Danzig and Upper Silesian questions, etc. Briand made an earnest effort to remove the diplomatic friction between the two countries but from the outset he encountered the opposition of the conservative elements under the leadership of Poincaré. Further dissatisfaction in France was produced by the results of the Washington Conference at the end of 1921. See *WASHINGTON CONFERENCE*. By virtue of the fact that this Conference concerned itself chiefly with problems of the Pacific, France was placed at this meeting in a position of less importance than either the United States, Great Britain, or Japan. The Agreement on Naval Limitation, subscribed to by Briand, was felt to be disadvantageous to France. This discontent delayed the ratification of the Five Power Naval Treaty by France until July 7, 1923. The hostility toward Briand in the Chamber, resulting from what was considered his too conciliatory attitude, reached such intensity after the Cannes Conference, Jan. 6-12, 1922, that Briand deemed it best to resign (Jan. 12, 1922).

The reaction against Briand's policy brought Poincaré into office. The new Prime Minister stated from the outset that he preferred strong methods and the old diplomacy to conciliation and conferences and in consequence a distinct change for the worse took place almost immediately in Franco-British relations. Poincaré had inherited from his predecessor a pledge to attend the forthcoming Genoa Conference (Apr. 10-May 19, 1922), and, while refusing to go himself, he felt bound, in compliance with the obligation entered into by Briand, to send a delegation which was headed by Louis Barthou, the President of the Reparations Commission, as his personal representative. Owing to Poincaré's insistence that neither the Peace Treaty nor Reparations should be subject to discussion at the Conference, the Genoa meeting had at best only a moral effect.

The Hague Conference, held in June of the same year, which was intended to be a continuation of the Genoa Conference, likewise ended in failure, since no agreement could be reached with the Soviets. In the Turkish question, France found herself during 1922 often in a rather embarrassing position to Great Britain and it was only after the sweeping Turkish victory in August, 1922, that the two Powers recognized the harmful effects of their disagreement and arrived at more effective cooperation in regard to Turkey; but the Reparations problem, and the connected problems of the inter-Allied debts and of security for France, tended more and more to produce serious divergence of opinion between France and Great Britain, all the more so in view of Poincaré's reversion to strong methods at the close of 1922. At the conference with Great Britain, held in Paris during the opening days of 1923, Poincaré announced his intention of seizing from Germany productive guarantees with the view of holding them till Germany fulfilled her obligations under the Peace Treaty. Accordingly, French troops were ordered on Jan. 10, 1923, to occupy the Ruhr. See *REPARATIONS*.

This action not only caused anger abroad and among France's allies, but also evoked protests from the Left groups in the French Chamber. When it came to a showdown, however, the Chamber, with the exception of the Communists and some of the Socialists, supported Poincaré

in his venture. The Ruhr occupation involved a heavy drain on French resources and complicated still further the already very serious French financial situation. During his premiership, Poincaré strove with zeal to consolidate French military supremacy by encouraging the afterward discredited Separatist movement in the Rhineland and by cementing France's relations with the Little Entente (q.v.). The French policy toward the latter aimed at the building up of a wall of defense for France out of the succession states which had been constructed by the Peace Conference on the ruins of the former three great Powers of the European continent. By rendering political, military, and financial assistance to these new states, France bound them to her in close alliance and thereby sought to prevent the possible rise of these former Powers in challenge to her own hegemony on the European continent.

Meanwhile the failure of Poincaré's Ruhr and Rhineland ventures and the comparative isolation of France among the Powers resulting from his policy had greatly diminished his popularity at home. Already, during the summer of 1923, a number of by-elections had gone against the government and the Radical-Socialists and the United Socialists had formed the Bloc des Gauches for the purpose of offering a compact political organization in the forthcoming elections in opposition to Poincaré's and Millerand's Bloc National. Moreover, the Prime Minister was seriously embarrassed in the early spring of 1924 by a domestic crisis due to the dwindling of the value of the franc and the increase in the cost of living. Poincaré's proposal to meet the critical financial situation by an increase in the taxes amounting to 20 per cent, while credit to his courage, did not improve his chances in the impending elections. In the face of strong opposition, the Government's tax bill was carried on Feb. 22, 1924. Poincaré took drastic measures to stop the continued fall of the franc, but the currency crisis was not remedied until Morgan & Co. stepped into the breach with a loan. All these measures were used by the opposition against Poincaré in the Chamber and in the constituencies. When defeated on March 26 on an unimportant issue, Poincaré resigned but resumed office two days later with a reconstructed cabinet.

In regard to the Dawes Report of Experts, Poincaré after some hesitation signified his approval, but raised and left open the all-important question of "sanctions" in case of German default. He also refused to declare his willingness to evacuate the Ruhr. His attitude was, however, of less importance than formerly in view of the results of the elections on May 11, 1924, which indicated a defeat of the Bloc National by the Bloc des Gauches. The composition of the new Chamber was as follows: Conservatives, 11; Republican Entente, 137; Left Republicans, 92; National Radicals, 34; Radical Socialists, 127; Independent Socialists, 39; Unified Socialists, 101; Communists, 29. The government strength was roughly 274, while the opposition was able to muster at least 296.

The radical opposition immediately brought strong pressure to bear against Poincaré and Millerand. They aimed not only at the fall of the Poincaré government, which was a foregone conclusion, but at the resignation of President Millerand as well. They charged the President with having gone outside the non-

partisan sphere within which the President of the French Republic is confined by tradition and the spirit of Republican French government. The chief reason for their opposition to Millerand was, however, the fact that the latter was, in conjunction with Poincaré, the maintainer of the Nationalist policy inaugurated by Clémenceau during the War. Upon the assembling of the Chamber on June 1, the Poincaré government stepped out of office. Determined opposition, however, was encountered from President Millerand, who was not willing to relinquish his office without a serious fight. A tense parliamentary crisis ensued in consequence. Millerand attempted to gain time by appointing the stop-gap cabinet of François-Marsal, on June 8, but the radical opposition, which numbered by this time 307 deputies, would have no relations with it and forced it out on June 10. A message of the President was met by a vote of 329 to 214 in the Chamber and of 154 to 144 in the Senate in favor of the technical motion to adjourn all discussion of the message, whereupon President Millerand resigned his office on June 11. On June 12 the moderate Radical-Socialist Doumergue, President of the Senate, was elected President by 515 votes against 309 for the more advanced Radical-Socialist Painlevé, President of the Chamber, and two days later Herriot formed a Radical-Socialist cabinet. Since the Radical-Socialist Party, the party of Caillaux, was now in power, supported by the Socialists, and since the new Premier had been Caillaux's successor as the leader of this party, the change in the French government may reasonably be regarded as a step in the direction of the policy of Caillaux.

This development was signified by the immediate passage by the Chamber of an Amnesties Bill of broad scope with specific clauses under which the cases of Caillaux and Malvy could be included, although the Senate did not pass the bill until near the close of the year. With a narrow majority in face of the large Nationalist bloc in the Chamber, the Herriot government had to take into consideration the wishes of the Nationalists and could not at once abandon the Poincaré policy entirely. On the whole, the Bloc des Gauches in internal affairs favored chiefly reduction of taxes and of military service and a resumption of anti-clerical legislation, while in foreign affairs it stood for complete accord with England, a betterment of Franco-German relations through conciliatory methods on the part of France, for international as against isolated French action in regard to Reparations, and against the occupation of the Ruhr.

These foreign policies were clearly in evidence at the London Conference in July and August, 1924, which provided for the application of the Dawes Report, and for the time being removed the vexed question of Reparations from the field of discussion. Second in importance only to Reparations was the evacuation of the Ruhr, which the Allies promised would take place within a year if the Germans fulfilled their obligations under the Dawes Plan. Evacuation, in fact, began almost at once and by the end of the year was well advanced. A happy outcome of the conference was the reestablishment of the cordial understanding between France and England which had seemed on the point of vanishing before the advent of the two radical ministries. The Poincaré party naturally op-

posed the terms of the agreement, but Herriot was supported by substantial majorities in both houses of Parliament.

Various other policies of the Herriot ministry reflected its liberal character. French ports were opened to German shipping for the first time since the War. The government's match monopoly was reestablished. Military maneuvers due in the autumn were postponed. A strong supporter of the League of Nations, Premier Herriot personally attended the meeting of the League Assembly in September; and his ideas supplied the basis for the Geneva Protocol adopted there, providing for arbitration, mutual guarantees of security, and a future disarmament conference. On October 28, France extended recognition to the Russian government, stipulating that the old Russian debts to French bondholders were still considered valid by France and that there was to be no interference by either country in the internal affairs of the other. On December 4, Leonid Krassin was received as the first Soviet Ambassador to France. His arrival was made the signal for riotous demonstrations and for wholesale arrests on the discovery of an alleged revolutionary plot. While the opposition to these various measures was more or less pronounced, the real storm came over the decision to discontinue French representation at the Vatican, and other anti-clerical moves.

In Alsace-Lorraine, the Government proposed to put through a programme of secularizing the schools, all of which offered religious instruction of some kind. The old religious fires were rekindled and discussion raged throughout France. See *ALSACE-LORRAINE*. In September, the cardinals of France addressed a letter to the Prime Minister protesting against the action with regard to the Vatican and Alsace-Lorraine, as well as the Government's strict application of the laws suppressing religious orders. Herriot replied rather tartly. The bill suppressing the Vatican Embassy finally passed the Chamber Feb. 2, 1925, but Alsace-Lorraine was left with a special representative at Rome. The long religious controversy weakened the Herriot ministry, however, and contributed to its early downfall. It also alienated some of its supporters by the stand Herriot took toward the question of evacuating the Cologne area in accordance with Treaty provisions. In December, 1924, the Council of Ambassadors decided it could not carry out this evacuation because Germany had not kept faith in disarming, and on Jan. 28, 1925, Premier Herriot made a speech supporting that position and emphasizing the necessity of military security for France. While Parliament supported him, the Socialists were none too well satisfied. The troops were actually withdrawn a year later.

But the leading issue which led to Herriot's resignation was one which was to trouble France increasingly until it brought her to the brink of disaster. This was the highly critical state of French finances. Poincaré's efforts to check the depreciation of the franc early in 1924 had had only a temporary effect. Under the Herriot regime, with the extremists insisting on a capital levy and with increased taxes inevitable, the exodus of French capital became more pronounced than ever. Further falling-off in exchange and rise in living costs were the immediate results. To raise the thirty-three and one-half billion of francs called for by the 1925

budget, which was not passed until the spring of that year, the Government proposed an internal loan of 10 per cent on the country's entire wealth and an increase in the limits of note issue by the Bank of France from 41 billion to 45 billion francs. On this latter issue, the Government was defeated in the Senate and resigned, Apr. 10, 1925. On April 17, Painlevé formed a cabinet in which he retained for himself the position of Minister of War.

The formation of the new government was signalized by the return of Caillaux, who became Minister of Finance. He had long enjoyed the reputation of being almost a miracle-worker in finance and the country looked to him to find a way out of its difficulties. At the end of June, he proposed a further note issue of six billion francs and a loan to be used in part to consolidate the floating debt. He also turned his attention to the war debts which France owed to England and the United States. In August, he arranged in London a settlement of the former, conditional on the making of a similar agreement with the United States, and he then made a somewhat hurried visit to Washington. He was unable to agree on terms with the American commissioners. Returning to France with diminished prestige, he was eventually forced out of the cabinet on the capital levy issue (Oct. 27, 1925).

The Painlevé ministry itself survived only until November 22, when it likewise foundered on the rock of finance. It was succeeded by another Briand ministry with Louis Loucheur as Minister of Finance, but he soon gave way to Doumer, and when Briand reconstructed his ministry in March, 1926, Doumer's place was filled by Raoul Peret. All their efforts failed to stop the downward course of the franc. A committee of experts appointed in June made a number of recommendations which influenced the Government's later policies, but did not save the immediate situation. On June 15, Briand again resigned, but once more formed a cabinet, turning again to Caillaux for the post of Finance Minister. With the franc down to a value of about two cents United States currency, the situation became desperate. There was more and more talk of an overthrow of the Republic and the setting up of a dictatorship. On July 17, Caillaux requested dictatorial financial powers for a limited period but was refused by a vote of 288 to 243. Briand then resigned. Herriot formed a cabinet which lasted but a day or two. President Doumergue then called upon Poincaré to head a government of National Union, and he succeeded in forming such a coalition, with six former premiers in his cabinet. Parliament willingly rushed through the measures he desired, including notable increases in taxes on foreign trade, transportation, sales, property transfers, and foreign investments. As a result of these and other energetic measures, the franc rapidly recovered, public tension was eased, and the greatest crisis the country had faced since the War was passed.

During the remainder of the year, the financial position steadily improved. The budget for 1927 was approved well before the beginning of the year, a rare occurrence in modern French history. A discordant note came from the Left, which continually reminded Poincaré that he was put in control to stabilize the franc. As a matter of fact by December, 1926, the franc had attained a value of about four cents, and for

a year and a half it was actually, though not legally, stabilized at that figure. By the middle of 1928, the floating debt had been reduced, a gold reserve built up, and other requirements met and Parliament passed the bill which put France on a gold basis again with the value of the franc fixed at 8.92 cents, or 25.52 to the dollar. Premier Poincaré continued to enjoy the support of Parliament and the country, as evidenced in Senatorial elections on Jan. 16, 1927, and general elections Apr. 22 and 29, 1928. The latter were held under the new electoral law of July, 1927, by which deputies were elected separately by districts, as in the United States, instead of collectively by "lists."

While the domestic life of the nation was thus passing through dramatic phases, foreign affairs were somewhat more felicitous. As Foreign Minister, Briand pursued a course of his own which often fretted Poincaré but which he had to accept as the price of Radical support for his government. On Apr. 29, 1926, M. Bérenger, appointed Ambassador to the United States to succeed the veteran Jusserand, had come to an agreement with the American government on terms of settlement of the war debt which brought a vexed question one step nearer solution. The total debt was fixed at \$4,025,000,000. With increasing rates of interest, it was to be paid in 62 annual installments rising gradually from \$30,000,000 in 1926 to more than \$113,000,000 in 1927. Payments were to be made in gold or United States securities, and were not to be contingent on payments of reparations by Germany.

Strong objection to these terms developed in France, and continual efforts were made by the Government, urged on by public opinion, to have them modified. As the United States continued obdurate, French feeling became increasingly bitter toward that country. A growing anti-Americanism threatened to mount to serious proportions, when suddenly it was turned into an almost cordial goodwill by a dramatic and unheralded event. On May 21, 1927, Charles A. Lindbergh in *The Spirit of St. Louis* made his non-stop, 33-hour flight from New York to Paris. For weeks he was wildly acclaimed wherever he went, and the diplomats were quick to seize on the happy occurrence to bring again into being a friendly sentiment for America. See AERONAUTICS.

Opposition to the Mellon-Bérenger debt settlement nevertheless continued and found expression in various ways. It was felt by some American commentators that the feeling had much to do with the action of France in establishing a higher general tariff rate to apply to American imports among others, and at the same time concluding a tariff agreement with Germany (Aug. 17, 1927) under which certain imports would enjoy special rates. The United States protested vigorously, and France finally accorded American goods the same favors as German. Action upon the Mellon-Bérenger agreement was finally forced by the fact that \$400,000,000 which France owed the United States for war supplies was to come due Aug. 1, 1929. This amount was funded in the debt settlement, and if the agreement was ratified, immediate payment would not have to be made. Poincaré threw the whole weight of his ministry into the fight for ratification, staking the life of his government on the outcome, and on July 21, 1929, the Chamber approved the terms without reservations by a

majority of only eight votes. The Senate ratified the agreement, and the approval likewise of the Caillaux-Churchill agreement signed with Great Britain in 1926 was taken for granted. Owing to ill health, Poincaré resigned on July 26, 1929, and was succeeded by Aristide Briand, who formed a ministry representative of the different parties.

Among the achievements of Briand in the field of foreign relations, his coöperation with other European statesmen to bring into being the Locarno Pact particularly stands out. By this agreement, concluded in October, 1925, Germany was admitted to the League of Nations, her western boundaries were accepted, and mutual guarantees of security were given by the leading powers. France received the agreement in somewhat critical mood, but readily accepted it and accorded to Briand his full measure of prestige. The accord with Germany was still further strengthened by a commercial treaty, by conversations looking toward a *rapprochement*, and by the withdrawal of the Inter-Allied Commission of Military Control from Germany.

Relations with Italy were marked by some friction when French authorities at Nice, on Nov. 4, 1926, arrested Colonel Garibaldi and proved that he was acting for the Italian government in instigating anti-Fascist sentiment for its own purposes. The visit of an Italian squadron to Tangier in 1927 provoked some critical comment in France and in December of that year France signed a treaty of friendship with Yugoslavia, as an offset to the Treaty of Tirana between Italy and Albania.

Relations with Russia were marked by a certain tension because of the charges freely made that the Russian Embassy in Paris was being used as a centre for Communist propaganda. An incident apparently confirming these charges occurred in the middle of 1927 and resulted in the recall of the Russian Ambassador, Rakovsky. In 1925 the revolt of the kfiifi in Morocco under Abd-el-Krim for a while took on serious proportions, but he was eventually captured and banished to the island of Réunion. See MOROCCO. In the same year, a revolt in Syria culminated in the shelling of Damascus by General Sarrail, bringing criticism at home and abroad.

Perhaps the most felicitous development of this period in the field of foreign relations arose almost casually, when Briand on Apr. 6, 1927, the anniversary of the entrance of the United States into the War, suggested a treaty between France and the United States outlawing war. Exchanges of notes developed the suggestion into a proposal for a multilateral agreement among the leading Powers. France at first deprecated the suggestion but widespread popular interest led Mr. Kellogg to follow it up, with the result that in 1929 the Kellogg Peace Pact, by which war was renounced as an instrument of national policy was signed by practically all nations.

The year 1929 saw also a great stride forward in settling the question of German Reparations. In September, 1928, Briand and Stresemann, German Foreign Minister, agreed to arrange for a committee of experts to determine a "final and definitive" settlement of the Reparations question. While the Dawes Report worked out a means by which Germany could pay reparations in given amounts, the actual total to be paid was left undetermined. Two experts from each

of the leading countries concerned were selected, Owen D. Young and J. Pierpont Morgan, being the unofficial delegates from the United States. They met in Paris on Feb. 11, 1929, and chose Mr. Young as chairman of the committee. After four months' work, they arrived at an agreement, signed June 7, 1929, by which the amount of German payments is definitely fixed over a period paralleling that in which the war debts are to be paid by European countries to the United States.

All France was plunged in mourning by the death of Marshal Foch, at the age of 77, on Mar. 20, 1929. See FOCH, FERDINAND.

**FRANCE**, frāns, ANATOLE (1844-1924). Pseudonym of Jacques Anatole Thibault, a French writer (see VOL. IX), who won the Nobel Prize for Literature in 1921. His later works include *La révolte des anges* (1914); *Sur la voie glorieuse*, addresses, etc. (1914); *Ce que disent nos morts* (1916); *Amycus et Célestin* (1916); *Le petit Pierre* (1918) and *La vie en fleur* (1922), both autobiographical; *Le génie latin*; *La Grèce et la patrie* (1919); *Le Comte Morin, député* (1921); *Marguerite* (1921); *Les noces corinthiennes*, a lyrical tragedy with music by Henri Busser (1922); *Dernières pages inédites d'Anatole France*, published by Michel Corday (1925), and *Prefaces, Introductions, and Other Uncollected Papers* (trans. 1928). Nearly all of his works have been translated into English. Consult *Les théories sociales d'Anatole France*, by Maurice Gaffiot (1923); *Anatole France, the Man and his Work* by James Lewis May (1924); *Pensées d'Anatole France*, collected by M. Laussel and René Ledoux-Lebard (1925); *Anatole France Himself*, by his secretary, Jean Jacques Brousseau (1925); *La vie et les opinions d'Anatole France*, by Jacques Roujon (1925); *Anatole France and his Circle*, by Paul Gsell (1926); *Anatole France the Parisian*, by Leslie Stewart (1927); *Anatole France d'après ses confidences et ses souvenirs*, by Michel Corday (1927), and *Anatole France Abroad*, by Jean Jacques Brousseau (1928).

**FRANCHET D'ESPEREY**, frān'shā' dēs-per'ā, LOUIS FÉLIX MARIE FRANÇOIS (1856- ). A French marshal, born in Mostaganem, Algeria. He saw service in North Africa and elsewhere, and in 1913 was commander of the 1st Army Corps, doing distinguished service in attempting to hold back the German advance in the retreat from Mons, in September, 1914. He succeeded General Lanza in command of the 5th Army before the first battle of the Marne. In 1916 he was given command of the northern armies in France, in 1917 of the central armies, and in 1918 he was made Commander-in-Chief of the Allied Army in the Near East. He organized, and successfully carried out, a general attack of the armies which forced the Bulgarian armistice in September, took Belgrade in October, and forced Turkey and Hungary to capitulate in the same month. He was in charge of the Allied forces in Eastern Turkey and the Balkans in 1919, was created a marshal in 1921, and was a member of the Higher War Council and Inspector General of the African field troops. Consult *Le Maréchal Franchet d'Esperey*, by Alphonse Louis Grasset (1920).

**FRANCIS**, DAVID ROWLAND (1850-1927). An American merchant (see VOL. IX). He became United States Ambassador to Russia in 1916 and was the first representative of a foreign nation to recognize the new Republic of Russia.

He returned to the United States when the Bolsheviks gained control of the government.

**FRANCIS**, EDWARD (1872- ). An American pathologist born at Shandon, Ohio. Having received the degree of Sc.B. from Ohio State University in 1894, he studied medicine at the University of Cincinnati, graduating in 1897. Since 1900 he has been associated with the Hygienic Laboratory of the U. S. Public Health Service, in which capacity he has studied yellow fever, pellagra, filariasis, tetanus, undulant fever, and tularemia. He is best known for his pioneer work on the latter subject (see TULAREMIA). The American Medical Association awarded him its gold medal in 1928 for "his thorough and important scientific contributions to the knowledge of tularemia." In the same year, he contracted undulant fever while at work on that disease and was incapacitated for some months.

**FRANCK**, HARRY ALVERSON (1881- ). An American traveler and author, born at Munger, Mich. He studied at Michigan, Columbia, and Harvard universities in this country and did graduate work abroad. He is the author of *A Vagabond Journey around the World* (1910), *Four Months Afoot in Spain* (1911), *Tramping through Mexico, Guatemala, and Honduras* (1916), *Vagabonding down the Andes* (1917), *Vagabonding through Changing Germany* (1919), *Working North From Patagonia* (1921), *Wandering in Northern China* (1923), *Glimpses of Japan and Formosa* (1924), *Roving Through Southern China* (1925), *East of Sudan* (1926), and *The Fringe of the Moslem World*, (1928).

**FRANCKE**, KUNO (1885- ). A German-American scholar and author (see VOL. IX). He became professor emeritus and honorary curator at Harvard in 1917 and was president of the Modern Language Association of America (1917). He wrote *A German-American Confession of Faith* (1915); *The German Spirit* (1916); *Personality in German Literature before Luther* (1916); *Die Kulturwerte der Deutschen Litteratur von der Reformation bis zur Aufklärung* (1922); *Die Kulturwerke der Deutschen Litteratur in Ihrer Geschichtlichen Entwicklung* (1923); *Kant and Art* (1925), and *German After War Problems* (1927).

**FRANÇOIS-MARSAL**, frān'swā-mār'sōl', FRÉDÉRIC (1874- ). A French public official, military man, and financier who was educated at the Lycée Louis-le-Grand and at Saint-Cyr, the French military academy. After serving in the army, as a member of the governor general's cabinet in Indo-China, and in the banking world, he entered the Senate in 1919 as a Union-Republican. Early in the following year, he became finance minister under Millerand and Leygues (until Jan. 12, 1921), and again under Poincaré (Mar.-June, 1924), when he floated the peace loan of 1920 and took measures to consolidate the floating debt of 70,000,000,000 francs (1924) of the French Republic. On the fall of Poincaré with the radical victory in the elections of 1924, President Millerand chose François-Marsal as premier (June 9-13), but the radical majority in the Chamber refused to accept a cabinet named by Millerand. Both Millerand and François-Marsal resigned and Herriot became premier. François-Marsal remained a leader of the opposition and was influential in causing Herriot's downfall. He was president of the International Colonial Institute (1927-

29), and wrote *Trois mois au Rouang-Si*, as well as books and articles on finance and political economy.

**FRANK, BRUNO** (1887- ). A German writer, poet, and dramatist, born at Stuttgart. His plays, noted for their psychological study of social problems, include *Die Schwestern unter der Fremde* (1918), and *Das Weib auf dem Tiere* (1921). He also wrote the novels *Die Fürstin* (1915); *Der Baron Trenck* (1926, Eng. trans., 1928); and the biography, *Tage des Königs* (Frederick the Great, 1924).

**FRANK, GLENN** (1887- ). An American publicist and university president, born at Queen City, Mo., and educated at Kirkeville State Normal School and at Northwestern University (1912). He was editor-in-chief of the *Century Magazine*, 1921-25. Since 1925 he has been president of the University of Wisconsin. He published *The Politics of Industry* (1919), *An American Looks at His World* (1923), and *Thunder and Dawn* (1928), studies in the outlook of Western civilization. He was co-author of *The Stakes of the War* (1918), and *The League of Nations—The Principle and the Practice* (1919).

**FRANK, REINHARD** (1860- ). A German jurist and privy counselor, born at Reddighäuser Hammer, and educated at the universities of Marburg, Munich, and Kiel. In 1887 he became lecturer at Marburg, and subsequently held professorships at Giessen (1890), Halle (1900), Tübingen (1902), and Munich (1914). In 1920-21 he was rector of the University of Munich. His numerous publications include *Wolfsche Strafrechtsphilosophie und ihr Verhältnis zur Kriminalpolitischen Aufklärung im Achtzehnten Jahrhunderts* (1887); *Naturrecht, Geschäftliches Recht und Soziales Recht* (1891); *Strafrechtliche Fälle zu Akademischem Gebrauch*, 5th ed. (1912); *Schutzstrafe und Vergeltungsstrafe* (1908); *Die Belgische Neutralität* (1915); *Kann Wilhelm II Ausgeliefert Werden?* (1919); and *Sinn und Tragweite des Auslieferungsgesetzes* (1920). He became editor of the *Vergleichende Darstellung des Deutschen und Ausländischen Strafrechts* and the *Pitaval der Gegenwart*. He was also made a member of the *Kommission für das Strafgesetzbrauch*.

**FRANKFURTER, FELIX** (1882- ). An American lawyer and educator, born at Vienna, Austria. He came to the United States in 1894 and in 1902 graduated from the College of the City of New York. He studied law at Harvard and from 1906 to 1910 was United States Attorney of the Southern District of New York. After 1914 he was professor of law at the Harvard Law School. During the World War, he acted as major and judge-advocate, and as secretary and counsel of the President's mediation commission. In 1918 he was appointed chairman of the War Labor Policies Board. He was also a member of the board of directors of the Institute for Government Research, and was the author of *Cases Under the Interstate Commerce Act* (1922), *Oregon Hours of Labor Case* (1923), *District of Columbia Minimum Wage Cases* (1923), and *The Case of Sacco and Vanzetti* (1928).

**FRANKLIN, EDWARD CURTIS** (1862- ). An American chemist, born at Geary City, Kan., and educated at the Universities of Kansas, Berlin, and Johns Hopkins. He was an assistant in chemistry at the University of Kansas, where in 1899 he attained the chair of physical chemistry. In 1903 he was called to the associate

professorship of organic chemistry in Leland Stanford, Junior, University, where in 1906 he became full professor. He was professor of chemistry with the hygienic laboratory of the United States Public Health Service (1911-13), physical chemist of the Bureau of Standards (1918), and held similar posts with other government advisory boards. His original investigations, published in chemical journals, have had to do with liquid ammonia as an electrolytic solvent, the ammonia system of acids, bases, and salts, and various other preparations of which ammonia is an important constituent.

**FRANKLIN-BOUILLON, HENRI** (1870- ). A French diplomat and public official, born on the Island of Jersey. He was elected a Radical-Socialist deputy to the French Parliament in 1910 and during the World War was chairman of its committee on foreign affairs, establishing the "committee for parliamentary action abroad" through which French war propaganda in Austria, the Balkans, and the Orient was directed. As French representative in Angora in 1921, he negotiated the treaty establishing peace with Turkey. After 1924 he was again president of the parliamentary committee on foreign affairs and played a leading part in the debates on reparations and war debts. See **TURKEY**.

**FRANKLIN COLLEGE**. A coeducational institution at Franklin, Ind., founded in 1834. The number of students increased from 206 in 1914 to 309 in the autumn of 1928, at which time the faculty numbered 28, and the volumes in the library 31,000. The endowment increased from \$312,500 in 1914 to \$860,000 in 1928, and the income from \$49,498 to \$108,918 in 1927-28. Between 1914 and 1924, departments of Biblical literature, sociology and economics, and art, were established; and between 1924 and 1928, new departments of music and public speaking were added to the curriculum; a science building was completed; and a new liberal arts curriculum, largely prescribed for the first two years and elective for the last two, was put into effect. President, Homer Price Rainey, A.M. Ph.D.

**FRANZ, SHEPHERD IVORY** (1874- ). An American psychopathologist (see **VOL. IX**), attached to the United States Government Hospital for the Insane. He edited the *Psychological Bulletin*, 1914-24, and was associate editor of *Psychobiology*. He was a member of the Psychology committee of the National Research Council in 1917 and president of the American Psychological Association in 1920. In 1925 he was appointed professor of psychology in the University of Southern California. In 1923 he published *Nervous and Mental Reeducation*.

**FRANZEN, AUGUST** (1863- ). An American portrait and genre painter (see **VOL. IX**). He became a member of the National Academy of Design in 1920 and was awarded the Academy's Portrait Prize in 1924.

**FRASER, JAMES EARLE** (1876- ). An American sculptor. He was born at Winona, Minn., and studied at the Art Institute in Chicago and at the École des Beaux Arts and Colorossi and Académie Julian, Paris. He was assistant to Augustus Saint-Gaudens and won the first prize in sculpture awarded by the American Art Association, Paris, in 1898, and many medals. Among his best-known works are the bust of Theodore Roosevelt in the Senate Chamber at Washington, the monument to Bishop Potter in the Cathedral of St. John the Divine,

New York, the monument to John Hay at Cleveland, "The End of the Trail" in Tulare County, Calif., the bust of Saint-Gaudens in the Hall of Fame, New York University, the portrait bust of Elihu Root, and the groups "Discoverers" and "Pioneers" for the Memorial Bridge at Chicago. He has been instructor at the Art Student's League, New York, since 1906. He was president of the National Sculpture Society in 1925-26 and became a member of the National Academy of Design in 1917.

**FRAZER, SIR JAMES (GEORGE) (1854- )**. A British anthropologist and folklorist (see VOL. IX). He received the Order of Merit (1925). His work, *The Golden Bough*, originally published in 2 volumes in 1890, rewritten and expanded to 12 volumes (1911-15), was republished in an abridged edition in 1922. He is also the author of *The Belief in the Immortality and the Worship of the Dead* (vol. i, 1913; vol. ii, 1922; vol. iii, 1924); *Essays of Joseph Addison, chosen and edited with a preface and a few notes* (1915); *Folklore in the Old Testament* (1918, abridged ed. 1923); *Sir Roger de Coverley and Other Literary Pieces* (1920); *Apollodorus, with an English translation* (1921); *Sir Ernest Renan* (1923); *The Worship of Nature* (vol. i, 1926), *The Gorgon's Head, and Other Literary Pieces* (1927); and *Man, God, and Immortality* (1927).

**FRAZER, JOSEPH CHRISTIE WHITNEY (1875- )**. An American chemist and educator, born at Lexington, Ky. He graduated from the Kentucky State University in 1897 and took post-graduate courses at Johns Hopkins. From 1901 to 1907, he was assistant and associate in chemistry at that university, and from 1907 to 1911 was chemist at the United States Bureau of Mines. In 1911 he became professor of chemistry at Johns Hopkins, and in 1921 B. N. Baker professor. He has conducted researches on osmotic pressure and vapor tension of solutions, catalysis, and the chemical behavior of surfaces.

**FRAZIER, LYNN JOSEPH (1874- )**. A United States Senator, born in Steele County, Minn., who was graduated from the University of North Dakota in 1901. A farmer by occupation, he was elected Governor of North Dakota for the term 1917-18, 1919-20, and 1921, but was recalled in 1921. He was elected U. S. Senator as a Republican for the term 1923-29 and reelected for the term 1929-35. He was a member of the group of Republican senators headed by Senator George W. Norris of Nebraska who frequently opposed Administration measures.

**FREDERICK, PAULINE (MRS. C. A. RUTHERFORD) (1885- )**. An American actress, born in Boston. She made her debut in New York in 1902. She played in many Broadway productions including *Innocent* and *Don't Shoot* and made her screen debut in *The Eternal City*. She later appeared in film versions of *Zaza*, *Tosca*, *The Woman on the Index*, *Bonds of Love*, *The Paliser Case*, *Madame X*, and *The Glory of Clementina*. She reappeared on the dramatic stage in 1923 in *The Guilty One*.

**FREDERICQ, frâ/de-rêk, PAUL (1850-1920)**. A Flemish historian (see VOL. IX). The German government exiled him from Belgium during the World War because of his activity in strengthening the morale of the Belgians. After the Armistice, he was appointed rector of Ghent University, but weakness from imprisonment

caused his death. He was a member of the Académie Royale de Belgique and the Académie des Pays-Bas.

**FREEMAN, EDWARD MONROE (1875- )**. An American botanist, born at St. Paul. He graduated from the University of Minnesota in 1898 and did graduate work there and at Cambridge. He became professor of botany and plant pathology at the University of Minnesota in 1908 and has been dean of the College of Agriculture, Forestry, and Home Economics at that university. Professor Freeman is the author of *Minnesota Plant Diseases*.

**FREEMAN, LEWIS RANSOME (1878- )**. An American author, born at Genoa Junction, Wis., and educated at Leland Stanford, Junior, University. He spent much of his time in traveling and as foreign war correspondent, with the British, French, and Italian armies (1915-17) and in Germany (1918). He wrote *Many Fronts* (1918), *Stories of the Ships* (1919), *Sea Hounds* (1919), *To Kiel in the Hercules* (1919), *In the Tracks of the Trades* (1920), *Hell's Hatches* (1921), *The Yellowstone to New Orleans* (1922), *When Cassi Blooms* (1922), *The Colorado River* (1923), *Down the Grand Canyon* (1924), *On the Roof of the Rockies* (1925), *By Water Ways to Gotham* (1926), *Water Ways of Westward Wandering* (1927), *The Nearing North* (1928).

**FREEMAN, ROBERT (1878- )**. An American clergyman, born in Edinburgh, Scotland. After engaging in mission work in Pennsylvania and New York for four years, he was ordained in the Baptist ministry in 1900; thereafter he held various pastorates until 1910. Since 1911 he has been pastor of the Pasadena, Calif., Presbyterian Church. He was moderator of the Synod of California in 1920-21. During the World War, he directed the first expeditionary division of the Y. M. C. A. and in 1917-18 was director of religious work in France. He is author of *The Hour of Prayer* (1914), *The Land I Live In* (poems, 1921), and *New Every Morning* (1927).

**FREE VERSE**. See LITERATURE, ENGLISH AND AMERICAN.

**FRENCH, DANIEL CHESTER (1850- )**. An American sculptor (see VOL. IX). He was awarded a medal of honor at the Panama-Pacific Exposition, in 1915, and a gold medal of honor by the National Institute of Arts and Letters, in 1918. From 1910 to 1915, he was a member of the National Commission of Fine Arts. His work after 1914 includes "Sculpture" (marble, St. Louis Museum); figures symbolic of Manhattan and Brooklyn on Manhattan Bridge; "Memory" (marble, Metropolitan Museum, New York City), his finest female nude; a statue of Lafayette, Easton, Penn.; the Dupont fountain, Washington, D. C.; and especially, a colossal bronze "Lincoln" for the Lincoln Memorial at Washington. Consult *Memories of a Sculptor's Wife*, by Mrs. Daniel Chester French (1928).

**FRENCH, JOHN DENTON PINKSTONE, FIRST EARL OF YPRES (1852-1925)**. A British field-marshal (see VOL. IX). He commanded the British forces in France from the beginning of the World War until December, 1915. On his resignation, he was made Viscount French of Ypres and High Lake and commander-in-chief of the United Kingdom, holding that post till May, 1918, when he was appointed Lord Lieutenant of Ireland. He resigned in 1921 and was made

an earl on returning to England. He received many honors from European governments and in 1920 was given the Freedom of the City of London and a sword of honor. See WAR IN EUROPE, under *Western Front*.

**FRENCH EQUATORIAL AFRICA.** A French possession in west-central Africa comprising the colonies of Gabun, Middle Congo, Ubangi-Shari, and Chad. Its area is estimated by the French at 912,649 square miles, excluding the Cameroon (See CAMEROON), of 166,489 square miles, which forms a separate colony joined to Equatorial Africa. By the census of 1926, it had a population of 3,127,707, of whom 2502 were whites. The largest cities had the following populations: Libreville, 20,000; Brazzaville, 40,000, Fort Lamy, 10,000. The tropical products continued the sources of economic wealth. Caoutchouc, lumber, ivory, palm kernels, palm oil, were the principal exports in 1926. Coffee and cacao were beginning to receive attention. Large herds of cattle, sheep, camels, horses, and ostriches were the property of the natives, but the lack of transportation eliminated them from the export trade. In 1927 total exports were 136,747,844 francs as compared with 21,181,768 francs in 1913. Imports in 1927 were 172,819,683 francs, as compared with 21,181,768 francs in 1913. The fall of the franc after the World War made the actual decrease in trade greater. In February, 1921, a line was commenced from Brazzaville to the Atlantic Ocean (300 miles). It is expected to be finished in 1930. The general budget in 1929 called for an expenditure of 54,500,000 francs. The four colonial budgets included expenditures of 58,740,000 francs. Colonization has been tardy because of the difficulties of transport. To hasten the country's settlement, the French Chamber passed, in 1920, a measure calling for the expenditure of 171,000,000 francs on railway, port, road, telegraph, and river developments. These improvements are being carried out gradually.

**FRENCH ESTABLISHMENTS IN INDIA.** Five provinces in India belonging to the French empire. These are Pondichéry (187,406 inhabitants in 1928), Karikal (57,488 population), Chandernagore (25,830 population), Mahé (11,706 population), Yanam (Yanaon, 4743 population). Total area, 196 square miles; total population, 287,173. The chief towns are Pondichéry (47,999), Oulgarret (24,518), and Villenour (21,774). Principal products are rice, sugar cane, cotton, manioc, cacao, coffee, ground-nuts. Imports in 1927 were 10,795,928 rupees; in 1913, 10,837,115 francs. Exports for 1913, were 43,720,095 francs, for 1927, 28,630,790 rupees. The budget for 1928 was 2,757,550 rupees.

**FRENCH ESTABLISHMENTS IN OCEANIA.** See PACIFIC OCEAN ISLANDS, under *Society Islands*.

**FRENCH GUIANA.** See GUIANA.

**FRENCH INDO-CHINA.** The general name for the French possessions in southeast Asia. It is made up of the following units: (1) Colony of Cochinchina, 26,476 square miles; population in 1926, 9,119,832; of which 13,452 were Europeans; largest city, Cholon, 198,713 population. (2) Protectorate of Annam, 39,758 square miles; population in 1926, 5,580,974, of which 2584 were Europeans; largest city, Binh-Dinh, 147,199 population. (3) Protectorate of Cambodia, 67,550 square miles; population in 1926, 2,535,178, of which 1901 were Europeans; largest city, Pnôm-Penh, 81,712 population.

(4) Protectorate of Tonking, 40,530 square miles; population in 1926, 7,401,912, of which 9143 were Europeans; largest city, Hanoi, 103,235 population. (5) Protectorate of Laos, 82,604 square miles; population in 1926, 855,146; largest city, Vien-Tiane. (6) Kwangchow Wan territory, 190 square miles; population, 205,000. Total area, 274,385 square miles; total population in 1927, 19,999,423 (18,000,000 estimated in 1914); number of Europeans, 34,443. The activities are largely agricultural, the country being one of the most important rice districts in the world. Cinnamon, sugar, and tea were also grown in central Annam. Minerals mined were coal and lignite, antimony, tin, wolfram, iron, and zinc. Cotton is becoming important in Cambodia. In 1926 total exports were 3,033,440,986 francs; imports, 2,641,945,471 francs. Leading imports are cotton tissues, cotton thread, iron and steel, machinery, and mineral oils.

In 1926, 878 ships of 1,959,577 tons entered the port of Saigon, Cochinchina. Other ports, though of less importance, were Tourane (Annam), Haiphong (Tonking), and Kwangchow Wan. Railways in 1927, 1485 miles. The general budget for 1927 balanced at 97,500,000 piastres, though excesses, never less than 7,000,000 piastres, occur annually. The debt of Indo-China in 1926 was 434,209,000 francs. Local budgets for the separate areas totaled 62,137,159 piastres in 1927. Money in circulation June 30, 1927, 149,412,000 piastres.

In 1918 and 1920, new codes of law were promulgated, while educational progress steadily made headway. In 1917 the various technical and professional schools were united to form the University of Indo-China and in 1918, a European college was opened at Hanoi. During the World War, France was able to draw upon the region for troops, money, boats, provisions, and raw materials.

**FRENCH LITERATURE.** French literature, after the outbreak of the World War in 1914, quite naturally must be divided into two periods, the WAR PERIOD, and the POST-WAR PERIOD.

From January to August, 1914, the literary world had remained untouched by the momentous political events; i.e., the movement started during the preceding decade had continued normally, namely: away from dilettantism, æstheticism, skepticism, and cynicism, toward social reform, national traditionalism, and Catholicism. For example, in poetry, Péguy's *Eve*; in prose, M. Barrès's *Grande Pitié des Eglises de France*; Juliette Adam's *Chrétienne*—(to refute her own *Païenne* of some years before); E. Baumann's *Le Baptême de Pauline Ardel*; also Lichtenberger's *Le Sang Nouveau* (the blood of those who are going to win the war), and J. des Gâchons's *Vive la Vie!* On the stage, Claudel had scored once more, with *L'Otage*, of the most consistent Catholicism; while Curel, *La Danse Devant le Miroir*, and Croisset in *L'Épervier* had described the hyper-sensitive soul of the generation; and Sacha Guitry affected the tone of indifference which he—one among very few indeed—was going to keep up all through the War.

Now let it be recalled at once, that in France especially, the war period in literature did not stop in November, 1918; it lasted until about the end of 1921, since which time only, one can truly say that the effects of the crisis are no longer the primary element of inspiration; neither did they ever stop altogether; we shall

mention under *War Literature* all books related to the subject to the close of 1928.

**War Literature.** With the first cannon shot, all, even periodical, literature stopped for several weeks, except the *Revue des Deux Mondes*, *L'Illustration*, and *Revue Hebdomadaire* (the latter in form of a newspaper); and *Le Temps*, *Les Débats*, *Le Matin*, *L'Echo de Paris*—but they contained articles from the pens of masters, like Barrès (*Echo de Paris*), Maeterlinck, Lavedan, Doumic, Gourmont, Maurras, Masson-Forestier, etc.

Promptly, as soon as the rear was somewhat reorganized, this war prose came out in book form. Some of the most noteworthy of these collections of articles are Barrès, the series *L'Âme Française et la Guerre* ("Union Sacrée" "Saints de France" "Croix de Guerre", etc.); Lavedan, *Grandes Heures*; A. France, *Sur la Voie Glorieuse*; Loti, *La Grande Barbarie*; Maeterlinck, *Débris de Guerre*; P. Adam, Maurras, Abbé Wetterlé (*Propos de guerre*, etc.), the Socialist Hervé (*Après la Marne, La Patrie en Danger*). Marcelle Tinayre, *La Veillée des Armes* will remain as one of the fine books of the great first hours of the War. Then in 1915 Romain Rolland published in book form his much resented *Au-Dessus de la Mêlée*, of Tolstolian or pacifist inspiration, a note sounded again in *Le Temps viendra* (1921). In the course of the year 1915, the first soldier diaries began to appear, preceded by the gallant, but hardly very trustworthy volume of fiction *Gaspard*, by René Benjamin. One after the other they came out, especially in 1916, these books which will remain as a stirring testimonial to the horrors of the World War: Paul Lantier, *Ma Pièce*; *Lettres d'un Soldat* (by the painter Lemerrier, but published anonymously); Rédier, *Méditations dans la Tranchée*; Genevoix, *Sous Verdun*; etc. The year 1917 brought Jean des Vignes Rouges's *Bourru, Soldat de Vauquois*, one of the notable war books, Adrien Bertrand's *Appel du Sol*, Marcel Nadaud's *Chignole*, a remarkably alert account of military aviation; and also, the same year the much discussed *Le Feu* came out, written by Barbusse. (The chief objection to it in France was that it was spreading discouragement at a time when all needed so much courage.) Finally, the year 1917 was also the year of Duhamel's *Vie des Martyrs* (later followed by *Possession du Monde*, the Goncourt prize for 1918); Duhamel's books were translated into many languages; he is one of the great number of writers whom the War revealed to the public, and one of the very few who remained really famous after the war. For others who distinctly forced public attention by their forceful description of the war, we will just give a few names here and refer for titles to the bibliographies named below: Dieterlen, Péricard, Le Bail, Dupont, Tuffrau, Belmont (*Lettres*), Erlande, Milan, Franconi, Binet-Valmer, Malherbe (Goncourt Prize 1917 for *Flamme au Poing*), Fribourg (*Croire*), Giraudoux, Fonck, Pirenne (a Belgian, *Vainqueurs de l'Yser*). The fourth year of the war was at hand, and while the diaries became less numerous, they were often more bitter; e.g., Léon Werth (*Clavel soldat*), M. Berger (*Jean Darboise, auxiliaire*), Barbusse (*Ôlarté*). Of the many decidedly superior war books since the close of the War, a few of the best are R. Dorgeles' *Croix de bois* (1920), Girard, *Les Vainqueurs* (1924), and L. Deltheil, *Les Poilus* (1926), which was much discussed. Some sad stories are told

by Zavie, *Prisonnier en Allemagne*, Hennebois, *Journal d'un Grand Blessé*, Blanche, *En Représailles*, Max, *Mes Six Évasions*.

Among the books which relate war achievements but were written by noncombatants, a few must be mentioned here: Le Goffic, a series of volumes the first of which is *Diamude, un chapitre de l'Histoire des Fusiliers marins*; H. Bordeaux, *Les Derniers jours du Fort Vaux*, and *Les Prisonniers délivrés*. Jean de Pierrefeu (who gave out the daily war bulletins), *Au G. Q. G. (Grand Quartier Général)*; M. A. Leblond, *Gallieni*; then Bédier's sober and impressive *L'Effort Français*, and Madelin's *Verdun*.

Here may be added a reconstitution of the phases of the War by Dumur, in his trilogy in Zola style: *Nach Paris, Boucher de Verdun, Les Défaitistes*; and in 1928, by the same, a very realistic reconstruction of the Rasputin episode, *Dieu protège le Tsar*. Books not dealing directly with the War and the army, but with events in the rear of the fighting zone and yet remarkable, are Isabelle Rimbaud, *Dans les remous de la bataille*; Donnay, *Lettres à une Dame Blanche* (Red Cross); Géraudy, *La Guerre, Madame . . .* (one of the most widely read for some time); Blanche, *Cahiers d'un Artiste*. It was in 1918 that the since very popular André Maurois earned his first laurels with the witty picture of the English in France during the War in *Les Silences du Colonel Bramble*.

When the War and victory exaltation came to a standstill, several talented authors endeavored to have the country realize the problems of reconstruction; such are, in 1920, Parmentier in *L'Ouvrage*; in 1921, Claude Anet in *Quand la Terre trembla*; in 1923 R. Dorgeles in his *Le Réveil des Morts*; and Pierre Hamp in his series of *Les métiers blessés*.

Of the works of fiction, that is, the novels, which, without depicting actual war episodes, take the War as background, these are a few samples: Bourget's *Le Sens de la Mort* and *Lazarine*; Prévost, *Adjudant Benoit*; Rosny, *L'Enigme de Gwreusse* and Giraudoux, *Stegfried et le Limousin* (two cases of double personality in a soldier); Bazin, *Les Nouveaux Oberlé*, about Alsace (1919) and *Baltus, le Lorrain* (1926); Estaunié, *L'Appel de la route*; Villetard, *Mon-sieur Bille dans la Tourmente*; Foley, *Sylvestre et son Blessé*; Colette Yver, *Mirabelle de Pampe-lume* (and other stories), *Les Cousins Riches* (the Americans); Marcel Boulenger, *Charlotte en guerre*. Some humorous stories: De la Foucardière, *Scipion Pégoulade* (a sort of Tartarin de Tarascon); M. Prévost, *Mon cher Tommy*; Boissière, *L'Extravagant Teddy de la Croix Rouge anglaise*; Dekobra, *Sammy, Volontaire Américain*; Valmy-Baisse, *Le Retour d'Ulysse*.

Short stories were published in fabulous number among which are *Contes véridiques des Tranchées*, by many "poilus," and collections by Arnoux, Bazin, Bordeaux, Farrère, Pawloski, Gus-Bofa, Frapié, and Mille.

The theatre of the war period is not extremely important. At first, old plays exalting devotion to the mother-country provided what was needed: Corneille's *Horace*, Sophocles' *Œdipe roi*, Bornier's *Fille de Roland*, Sardou's *Patrie*, Kistemaekers's *Flambée*, Lavedan's *Servir*. Then early in 1915 new plays began to appear: Fronson's *Kommandantur*, depicting the invasion of Belgium (Fronson is a Belgian); Donnay's charming *Impromptu du Paquetage*; Claudel's *Nuit de Noël*; E. Morand's

*Les Cathédrales*, spectacular mourning over Rheims and Strasbourg especially. In 1916 Bataille gave an unpleasant description of the effect of war on women in *L'Amazone*; while Hennique and Veber offered a cheerful two-act vaudeville *Le Poilu*. In 1917 came Bernstein's *Élévation*, hailed by many as the most stirring war play produced; Farrère and Népote offered *La Veillée des Armes*. In 1918 Kistemaker wrote *Un Soir au front*, and Maeterlinck, *Bourgeois de Stilemonde* (which was first presented in America). In 1919 there was F. Porché's very ingenious and successful allegorical *Les Butors et la Finette*; in 1920, the exquisite *Maison du Berger* by Fleg; the opportune (or inopportune) *Les Américains*, by Brieux; and the two plays—both painful for different reasons—Donnay's *Chasse à l'homme*, and Méré's *Les Captives*. In 1922 F. de Curel scored with *Terre Inhumaine*.

In the domain of poetry, again relatively few collections can be recorded as absolutely above par. It would not be right to leave unnoticed Botrel's *Chants de Rosalie* ("Rosalie" was the bayonet), *Chants du Bivouac*, *Chants de Route*; he was called the bard of the trenches; and Claudel, *Trois Poèmes de Guerre*. In 1916: Bataille, *La Divine Tragédie*; Zamacôis *L'Ineffaçable*; Paul Fort, *Poèmes de France*; and especially Verhaeren, *Les Ailes Rouges de la Guerre*. In 1917: The exquisite *Couronne douloureuse*, by H. Ghéon; and two of the most popular productions—rightly so—L. Mercier, *Prières de la Tranchée*, and the instantly famous *La Passion de notre Frère le Poilu*. In 1918 came out the very striking poems, *Nous . . . de la Guerre*, by Henry Jacques; and Mme. Delarue Madrus, *Souffles de Tempête*; in 1919 Rostand's *Vol de la Marseillaise*; and J. Suberville's strong *Fifre de Bernadoue* and *Fosse aux Lions*. In 1921 F. Porché republished with other poems his "L'Arrêt sur la Marne" (in the collection *Commandements du Destin*), and Suberville, *Le Soldat Inconnu*, which won for the author the Grand Prix de Poésie. See the anthology of the war poets, Prévost and Dornier, *Le Livre épique*.

For bibliography on the literature of the War, see: Baldensperger, *Avant-guerre dans la Littérature*; Albert Schinz, *French Literature of the Great War* (1919); Jean Vic, *La littérature de la guerre, manuel méthodique* (5 vols. 1918-1923); Thierry Sandre, *Anthologie des écrivains morts à la guerre* (1924).

**Post-war Period.** Just as the war literature did not stop on Nov. 11, 1918, so did the post-war literature not begin at this date exactly; as early as 1917 there is a distinct tendency on the part of some writers to ignore the monstrous accident of the War.

Bearing on the question of language in post-war Europe, consult Meillet, *Langues de l'Europe nouvelle* (1918).

**Poetry.** Some volumes from 1917 to the end of 1923 which cannot be passed without mention, if it were only on account of the fame of the authors, are Rostand, *Cantique de l'Aigle* including war poems, and Verhaeren, *Chants en forme de dialogues* (both posthumous); Rosemonde Gérard (*Madame Rostand*), *Pipeaux* (crowned by the French Academy); H. de Régnier, *Vestigia Flammæ* and *Flamma Tenax*; Comtesse de Noailles, *Forces Éternelles* and *L'honneur de souffrir*; Claudel, *Messe de Lù-Bas* and *Feuilles de Saints*; Fr. Jammes, *La Vierge et*

*les Sonnets*; Paul Fort, *Ballades Françaises* (continuation); Jules Romains, *Europe, Puissances de Paris*, and *Chants de dix années*. Two poets had a remarkable revival: Philéas Lebesgue (with his *Chansons de Margot*), and especially Paul Valéry, who is almost a god of poetry now; he was received in the French Academy in 1927; he was a bone of contention in the controversy over "Poésie pure" which started in 1925 (see *New International Year Book*). Among the best known of the poets of the new generations are L. Mercier and Suberville. To get an idea of the extra-modern poetry, see Paul Morand, *Lampes à Arc*; and the cubists and dadaists, Blaise Cendrars, *Du Monde entier*; A. Salmon, *Prikaz*, and Cocteau, *Poésies*. (Cf. Schinz, "Dadaïsme," in *Smith College Studies*, October, 1923). Consult H. Clouard, *Poésie française moderne des Romantiques à nos jours* (1923); de la Vaissière, *Anthologie des poètes du siècle* (1924); Tresch, *Evolution de la chanson française* (1924), and especially E. Bouvier, *Initiation à la littérature d'aujourd'hui*.

**Drama.** In the theatre, we witness early an attempt to go back to pre-war subjects: Claudel is continuing the series of *L'Annonce faite à Marie*, and *L'Otage*, by *Le Pain dur*; Bataille gives *Sœur d'Amour*. In 1920 Curel, *L'Âme en Folie*; Bernstein, *L'Animateur*; Saint George Bouhélier, *Esclaves*; DuBois, *L'Hérodiennette*; Brieux, *L'Avocat*, *L'Enfant*; Curel, *Comédie du génie*; Bataille, *Chair Humaine*; Bernstein, *Judith*. In 1921, we have no less than three versions of *Don Juan*: Rostand (posthumous), Bataille, and H. de Régnier; and in 1925 no less than three versions of Joan of Arc, especially Porché, *La vierge au grand cœur*. Then, there are those who belong to what may be called an intermediate generation, like P. Fort, *Louis XI, Homme Curieux*, Ghéon, *Pauvre sous l'Escalier*, Géraudy, *Aimer*. The younger group claims attention aggressively: Magre, *La mort enchaînée*; Lenormand, *Les ratés*, *Mangeurs de Rêves*, *Le Simoun*; Natanson, *Enfant Truqué*, *Amants Saugrenus*; Pierre Frondaie, *L'Appassionata*, *L'Insoumise*, *Le Reflet*; J. J. Bernard, *Feu qui Prend Mal*; Sarmant, *Mariage de Hamlet*, *Pêcheurs d'ombres*; Cromelynck, *Cocu Magnifique*; Cocteau, *Mariés sur la Four Biffel*; Régis et Veynes, *Bastos le Hardy*. Among the comedies that scored decidedly, there are Jules Romains' *Knock* (1924), Vautel's *Mon curé chez les riches*, from the author's novel (1925), and Bourdet's *Vient de paraître* (1927). The most famous theatres endeavoring, with changing fortunes, to favor young authors were: L'Œuvre, Le Vieux Colombier, L'Atelier, La Chimère, La Flamme, with such directors as Lugne Poé, Copeau, Dullin, Pitoëff, and Baty. Cf. Delpit, *Paris—Théâtre contemporain* (1924-25). Several plays stirred up considerable discussion in recent years: Raynal's *Tombeau sous l'Arc de Triomphe* (1924); Obey et Amiels's *La Carcasse* (1926); Bourdet's *La prisonnière* (1926), and Maurice Rostand's *Napoléon IV* (1928). See *New International Year Book*.

**The Novel.** Reaching the chapter of the novel since the War, we face such a deluge of works of interest that nothing can be done within the space allotted except to group the various tendencies, give the names of the most important writers in each group, and refer for all details to the *New International Year Book*, 1914-28 (and, until 1923, to "Le Roman Français depuis

la Guerre" by Albert Schinz, in *Modern Language Journal*, May, 1923).

Authors representing the great classical literary style and aiming to create works of lasting beauty: Ch. Géniaux, Estaunié, A. de Chateaubriant (Grand Prix du Roman in 1923, for *La Brière*). Catholics: Bourget, H. Bordeaux, Ardel, Baumann, and Mauriac (Grand Prix du Roman, 1926). Novelists dealing with the world beyond: Marcelle Tinayre (*Priscille Séverac*), H. Bordeaux (*Fantôme de la Rue Michel-Ange*), and Pérochon (*Les Ombres*). Provincial and regional novelists: Bazin, Pérochon (*Nèze*, Prix Goncourt, 1920), J. de Pesquidoux, Bordeu, H. Pourrat, R. Escholier (*Cante-gril*), J. des Gachons, Mme. Jean Balde (*Vigne et Maison*), Bouzinac-Cambon, *Domaine abandonné*, and the most famous of them all, L. Hémon, author of the Canadian novel, *Maria Chapdelaine*. Psychologists: André Gide, J. Romains, Marcel Proust (Prix Goncourt, 1919), who still has a tremendous following (he died in 1922); Chardonne, *L'Épithalame*; and Martin Du Gard, *Les Thibault*, etc. Novelists of deep gloom and sentimentality: Arnoux, Jaloux, Chéreau, Josepivici, t'Serstevens; and three women, André Corthis (Grand Prix du Roman, 1921, for *Pour Moi Seule*), Machard, and Vioux. Pictures of moral disequilibrium in consequence chiefly of the War: Marcel Prévost (*Don Juanes*), Rosny, Marguerite, and Mme. Colette. Novelists depicting the life of characters outside regular society: Carco (Grand Prix du Roman, in 1922, for *L'Homme traqué*), Mac Orlan, Cl. Anet, and Kessel. The "Indifférents," to use the name chosen by one of them, i.e., who take the attitude of interested and amused, sometimes cynical, observers of our present nerve-racked world: H. de Régnier, Fr. de Miomandre, Giraudoux, and Paul Morand. Young Cocteau belongs either here, or to a group of extreme modernists, some of whom had adopted the flag of Dadaism, like Aragon, Ph. Soupault, Delteil. Humorists would be Tristan Bernard, Duvernois, H. Béraud (Prix Goncourt for *Le Martyre de l'Odyssée*, 1922), and Billotey. The great king of the *roman d'aventure* is Pierre Benoît (author of *L'Atlantide*); of Exotism: Loti, Farrère, Rhais, and later Barrès (*Jardin sur l'Oronte*); and Bordeaux (*Yamilé sous les Cèdres*). A very special place belongs to the Brothers Tharaud with their remarkable knowledge of the Near East. Historical novels: Louis Bertrand, Tancrède Martel; H. Béraud (*Vitriole de Lune*, crowned by the Goncourt in 1922). Pre-historical novels: Rosny, Forbin, Jean d'Esme, etc. A number of serious novels extending over years of publication have appeared, or begun to appear, since Romain Rolland's *Jean Christophe*; the best known are Marcel Proust, *A la recherche du temps perdu*; Roger Martin Du Gard, *Les Thibault*; Romain Rolland, *L'âme enchantée*; René Behaine, *Histoire d'une société*; Jules Romains, *Le dieu des corps*.

If we were to mention the novels which in the last fifteen years have shown signs of possible protracted life, we would name, in alphabetic order Barrès, *Jardin sur l'Oronte*; Benoît, *L'Atlantide*; Béraud, *Bois du Templeur pendu*; Bernanos, *Sous le soleil de Satan*; Francis Carco, *L'homme traqué*; Chateaubriant, *La Brière*; Duhamel, *Vie des Martyrs*; Estaunié, *Au bord de la route*; L. Hémon, *Maria Chapdelaine*; Em. Henriot, *Arctio Brun*; Kessel, *L'équipage*; Leblond, *Ulysse Casse*; Mauriac, *Genitrix*, *Désert de l'amour*; Montherlant, *Les Bestiaires*; Mor-

and, *Ouvert la nuit*; Proust, *A l'ombre des jeunes filles*. . . ; Tharaud, *A l'ombre de la Croix*. . . Much has been made lately of Giraudoux's or Miomandre's books, also of J. Green, *Monte Cinère*, and Panait Istrati, *Mikhail*.

Other Literary Genres. One of the most important during the period under consideration was that of personal recollections by writers of fame, which at times are merely poetical evocations of the past, like A. France's *Petit Pierre*, Loti's *Prime Jeunesse*, A. Maurois's *Bernard Quesnay*, L. Bertrand's *J. Perbal*, H. Béraud's *Gerbe d'or*, R. Dorgelès's *Montmartre mon pays*, Ph. Soupault's *Histoire d'un blanc*, Jammes, A. Gide, Willy, etc; or many diaries of young authors who wrote about their years of formation so as to present a picture of their whole generation. The following claimed attention: Oudart, *Ma jeunesse*; L. Werth, *Dix-neuf Ans*; Cazin, *Décadi*; A. Obey, *Enfance inquiète*; Chardonne, *Inquiète Adolescence*; Benj. Crémieux, *Premier de la Classe*; Gilbert des Voisins, *L'Enfant prit Peur*; and the pitiful *Diable au corps*,—written by Radiguet when he was 17 (it is said. He died in 1924). Accounts of travel have been raised to the level of art in Chardonne's *Pot au Noir*; by the Brothers Tharaud with their remarkable descriptions of the Near-Eastern nations of Europe; also by A. Bonnard's and Gilbert des Voisins's books on China, Morand's *Rien que la terre*, H. Béraud's *Ce que j'ai vu à Berlin*, and Béraud's, Duhamel's, and L. Durtain's books on Soviet Russia. A Chevrillon's, *Enchantement Breton* is another fine sample of geographical literature. The (so far five) series of the famous barrister M. Henri-Robert, *Les Grands Procès de l'Histoire*, have been much read.

By far the most successful genre in recent years has been the literary biography, i.e., opposing to the absolutely objective biography the interpretative biography. A Maurois's *Arctio*, *Vie de Shelley*, soon followed by Pourtales's *Liszt*, started the movement. Now there are a number of collections of "lives", all written by very well-known authors, and of which four are particularly successful: *Roman des Grandes existences* (Balzac, Rimbaud, Villon, Baudelaire, Vingy, Montaigne, etc.); *Nobles vies, Grandes œuvres* (Guynemer, Racine, Demosthène [by Clémenceau], La Pérouse, Madame Roland, etc.); *Vie des hommes illustres* (Goethe, Stendhal, Montaigne, Disraeli, Alcibiades, Bismarck, Hugo, Mistral, etc.); *Leurs amours* (La vie amoureuse de Talma, Louis XIV, Musset, Beethoven, La Fontaine, Cléopâtre, Messaline, Hélène de Troie, Madame de Pompadour, Grande Catherine, etc.).

History of Literature and Literary Events. Bédier and Hazard, *Histoire de la Littérature Française illustrée* (1924) in two large volumes has proved very popular, being both less bulky and more up to date than the Petit de Julleville (8 vol.) of 1900. Simultaneously an illustrated edition of Lanson's well-known *History of French Literature* was published. Most worthy of mention are also volumes xii and xiii (they are called "*Histoire des Lettres*") of Hanotaux's *Histoire de la Nation Française*, in 15 vols. Vol. xii, "*Des Origines à Ronsard*," is by Picavet, Jeanroy, and Bédier; vol. xiii, "*De Ronsard à nos Jours*," is by F. Strowski. In America, Nitze and Dargan, of the University of Chicago, published an English *History of French Literature* (1922 2d ed., 1927). For the Middle Ages specially; Ch. V. Langlois, *La vie en*

*France au Moyen-Age*, as reflected in literature, 4 vols. For modern times, there was Le Goffic, *La Littérature Française au XIX<sup>e</sup> et au XX<sup>e</sup> Siècles*. A very valuable publication concerning contemporary writers was *Vingt-Cinq Ans de Littérature Française, de 1895 à 1920*, under the direction of E. Monfort. Not quite satisfactory on account of the author's frequent partiality, is Lalou's little book on *Histoire de la Littérature Française Contemporaine, de 1870 à nos jours*; (new ed., 1928). Mostly an accumulation of names and titles is found in F. Parmentier, *Littérature Française de 1885 à nos jours*; in America, *French Literature of the Last Half-century*, by Cunliffe and de Bacourt. Other efforts to illuminate the public on contemporary literature are those of M. Braunschvig, *La Littérature Française contemporaine* (1925), of A. Billy and of D. Mornet (1927), of E. Bouvier (1928), and E. Sée, *Théâtre contemporain* (1928). A work on a great scale which led the author to the Academy even before its completion is Abbé H. Brémont's *Histoire du Sentiment Religieux dans la Littérature depuis le XVII<sup>e</sup> Siècle* (8 vols. have appeared to date). Other important works include the following authors and titles: Thieme, of the University of Michigan, *Essai sur l'Histoire du Vers Français*; P. Champion, *François Villon, sa vie, son temps* (1914); A. Garnier, *Agrippa d'Aubigné et le parti protestant* (3 vols., 1928); Nolhac, *Ronsard et l'Humanisme*; Ducros, *Rousseau* (3 vols.); M. Souriau, *Histoire du Romantisme en France* (3 vols.,—crowned by the French Academy); Vincent, *Georges Sand* (4 vols.); Baldensperger, *Mouvement des idées pendant l'émigration*; B. Faÿ, *Esprit révolutionnaire en France et en Amérique à la fin du 18<sup>e</sup> siècle*; Arbelet, *Stendhal* (2 vols. in connection with the new edition of Stendhal's works); J. Larat, *Tradition et Exotisme dans l'Œuvre de Nodier*; H. Girard, *Émile Deschamps* (2 vols.); Sainte-Beuve, *Mes poisons* (posthumous); Ibrovac, *José-Maria de Hérédia*. New valuable editions which render the study of great French authors more and more profitable are: Villon, Ronsard, Montaigne, Pascal, Rousseau (Mornet's *Nouvelle Héloïse*), Stendhal, Lamartine (Lanson's *Méditations*), Hugo (ed. nationale published by Ollendorff's), and Bérét's *Légende des Siècles*, and Vianey's *Contemplations*. The *Correspondence générale de J. J. Rousseau* comes out since 1924 at the rate of 3 vols. a year, edited by Dufour-Plan. As to language, Brunot's *Histoire de la Langue française des Origines à 1900* has reached its ninth volume ("Révolution et Empire"); also we may note here Bonaffé's *Anglicismes et Américanismes dans la Langue Française*, and Mumford Jones, *America and French Culture*.

A time has never been in France without literary quarrels of some sort. The Goncourt controversy is ever going on: whether or not to publish the *Goncourt Journal* containing material offensive to living people or their relatives. During the World War (1917), there was the Barbusse episode, many maintaining that the book had been dishonestly used for pacifist propaganda; in 1919 Pierre Louys startled the world in ascribing to Corneille some of the best of Molière's plays; in 1920 the accusation was brought against P. Benoit that he had plagiarized Sir Rider Haggard's *She*, for his *L'Atlantide*; the same year the episode of Dadaism came to a climax in the ar-

tistic and literary world; in 1922 it was the shock of Margueritte's *Gargonne*; in 1922-23, the "querelle des manuels littéraires" (well summarized in *Chronique des Lettres Françaises*, January, 1923); in 1924 it was the attack on representatives of the Government who were supposed to use influence abroad in favor of certain publishing firms (see H. Béraud, *Croisade des longues figures*); and the vile attacks on Anatole France's memory; in 1925 it was the *Querelle de la Poésie pure* (see *New International Year Book*, 1925-26); in 1926-27, it was the great battle around the *Action Française* and royalist writers; in 1928 it was the accusation that André Maurois was a plagiarist on a great scale; and the Lauth-Boulenger affair regarding the latter's attack on George Sand's memory. (See also paragraph *Drama*, above).

Among the innumerable literary prizes, some are of real importance. Let us recall a very few: Grand Prix de Littérature went to no one (1914), E. Nolly (*Capitaine d'Étanger*, 1915), P.-M. Masson (1916), Fr. Jammes (1917), Mme. Gérard d'Houville (1918), the Brothers Tharaud (1919), E. Jaloux (1920), Mme. de Noailles (1921), P. Lasserre (1922), F. Porché (1923), Abel Bonnard (1924), General Mangin (1925), Courteline (1926), J. Pesquidoux (1927), and L. Vaudoyer (1928). The Grand Prix du Roman went to P. Acker (1915), Avesnes (Comte de Blois, 1916), Ch. Geniaux (1917), Camille Mayran (1918), P. Benoit (1919), André Cortis (1920), Villetard (1921), F. Carco (1922), A. de Chateaubriant (1923), E. Henriot (1924), Fr. Duhourcau (1925), Fr. Mauriac (1926), J. Kessel (1927), and Jean Balde (1928). The Prix Goncourt went to Benjamin (1915), A. Bertrand and Barbusse (1914—retroactively—and 1916), Malherbe (1917), Duhamel (1918), Proust (1919), Péronchon (1920), R. Maran (1921), Béraud (1922), L. Fabre (1923), Th. Sandre (1924), M. Genevoix (1925), H. Deberly (1926), M. Bedel (1927), and M. Constantin-Weyer (1928). The Prix de la Vie Heureuse, or Prix Femina, went to Y—(René Milan, 1917), H. Bachelin (1918), Dorgelès (1919), E. Goyon, a poet (1920), Escholier (1921), Lacretelle (1922), Jeanne Galzy (1923), Ch. Derennes (1924), J. Delteil (1925), Silvestre (1926), Marie Le Franc (1927), and Mme. Dunois (1928).

Many jubilees were celebrated: with special splendor, those of La Fontaine (1921) Molière, Pasteur—not only a man of science but also a member of the French Academy—(1922), Renan, Pascal, Ronsard (1924), since 1927—to last until 1930—Romanticism, and H. Taine (1928). Many deaths are to be recorded: in 1914, Lemaître, Masson-Forestier, Mistral, L. Séché, Ch. Péguy; 1915, Hervieu, R. de Gourmont, Stuart Merrill, J. H. Fabre (the entomologist); 1916, Faguet, de Ségur, de Vogüé, Verhaeren; 1917, A. Bertrand; 1918, G. Ohnet, Rostand, Péladan, Guill. Apollinaire; 1919, Tailhade, Ch. Morice; 1920, P. Adam, Lintilhac; 1921, Montesquiou; 1922, Bataille, Boutroux, Capus, La-visse; 1923, Aicard, Loti, Barrès; 1924, Anatole France, Comte d'Haussoville, H. Céard; 1925, Pierre Louys, E. Bourges; 1926, Jean Richepin, Boylesve, Le Braz; 1927, R. de Flers; and 1928, François de Curel.

In 1928 the heirs of Victor Hugo bequeathed to the city of Paris, to be turned into a museum, Hauteville House, on the island of Guernsey, where the poet lived in exile from

1853 to 1870, where he wrote, among other works, *Les Misérables* and *La légende des siècles*.

**FRENCH SOMALI COAST.** See **SOMALI-LAND**.

**FRENCH WEST AFRICA.** A single administrative unit of the French colonial possessions since Jan. 1, 1921, comprising the following colonies: Senegal, area 74,112 square miles, population in 1926, 1,318,287 (4650 non-African); Guinea, 89,436 square miles, population, 2,095,988 (2262 non-African); Ivory Coast, 121,590 square miles, population, 1,724,545 (1614 non-African); Dahomey, 41,302 square miles, population 979,609 (884 non-African); French Sudan, 360,331 square miles, population, 2,634,982 (1819 non-African); Upper Volta, 142,820 square miles, population, 3,240,147 (425 non-African); Mauritania, 154,400 square miles, population, 289,184 (279 non-African); Niger Territory, 463,200 square miles, population, 1,218,717 (260 non-African). Total, 1,247,191 square miles, with a population of 13,541,611, of whom 11,099 were French and 4300 other non-Africans. Dakar, the seat of the administration and the leading port, had 32,440 inhabitants in 1921, of whom 2331 were French. Other towns were: Saint Louis, 18,117 (620 French); Rufisque, 11,307 (168 French); Bamako, 14,496; Kayes, 11,322; Conakry, 8850. Forest and agricultural products are of greatest economic importance. In Senegal, the Sudan, and Guinea, the groundnut is of leading importance. Cotton culture, worked by natives, figures largely in Senegal, the Sudan, Dahomey, and the Ivory Coast. Other important activities, as reflected in the foreign trade, are palm kernels, palm oil, logs, gum arabic, hides and skins, and caoutchouc. Agricultural experiments indicated that the following were possible of development: cacao and coffee in Dahomey and the Ivory Coast, tobacco, vegetables, etc. Gold and salt were worked in paying quantities. Exports for the whole government in 1927 were 1,230,700,189 francs, as compared with 118,567,000 francs in 1912. Imports for the years 1912, and 1927, were 134,782,000 francs, and 1,407,620,740 francs. In 1927, 20,229 vessels of 16,466,259 tons entered and cleared ports of French West Africa. Communications are facilitated by the navigability of the Senegal and the Niger rivers. In 1927, 1950 miles of railway were in operation. The principal systems included: Dakar-Saint Louis (263 kilometers), Thiès-Kayes (144 kilometers), Kayes-Niger (155 kilometers), Guinea railways (662 kilometers), Ivory Coast railways (316 kilometers), Dahomey railways (375 kilometers). Miles of telegraph lines in 1927 were 14,386. The general budget for the whole administration was, for 1929, 245,044,000 francs, as compared with 56,250,000 francs in 1911. In 1929 the local budget for the separate colonies totaled: revenues, 400,000,000 francs, expenditures, 375,000,000 francs. At Dakar, the governor general, assisted by a council of native chiefs, administers the affairs of the whole government. Lieutenant governors are in charge of the individual colonies.

**FREUD**, **FRITZ**, **SEYMUND** (1856- ). An Austrian physician, originator of the psychoanalytic method for the treatment of neuroses (see VOL. IX). The international reputation of Freud increased after the World War. The pathological cases in the armies during the War put Freud's theories to something like an empirical test, and it was recognized by his own disciples

that sex was not the controlling factor. In his writings after 1914, Freud tended to make less use of the principle of sexual symbolism and relied more on the direct intuitions afforded by the psychological situations. The conception of the libido continued to play an important rôle, but without complete identification with concrete sex experience. See **CONSCIOUSNESS AND THE UNCONSCIOUS**; **ÆSTHETICS**; **PSYCHOLOGY**, **ABNORMAL**, AND **PSYCHOANALYSIS**; **PERCEPTION**.

Freud's works after 1914 include *Totem and Taboo* (1915); *Wit and Its Relation to the Unconscious* (1916); *Leonardo da Vinci* (1916); *Delusion and Dream* (1917); *The History of the Psychoanalytic Movement* (1917); *Reflections upon War and Death* (1918); *Massenpsychologie und Ichanalyse* (1921; English translation, *Group Psychology and the Analysis of the Ego*, 1922); *General Introduction to Psychoanalysis* (1921); *Hemmung, Symptom und Angst* (1926); *Zur Frage der Laienanalyse* (1926), and *Die Zukunft eines Illusion* (1928). His works were translated into English, French, and other languages.

**FREY**, **FRITZ**, **EMIL** (1838-1922). A Swiss statesman (see VOL. IX), who died near Basel, Switzerland. He was one of the technical experts attached to the Swiss delegation at the Genoa Conference.

**FRIDAY**, **DAVID** (1876- ). An American economist and educator, born at Coloma, Mich. He graduated from the University of Michigan in 1908, and was a member of the faculty of that university from 1908 to 1916, when he was appointed professor of economics at New York University. In 1918 he was head of the department. He was professor of political economy at the University of Michigan, 1919-21; president of the Michigan Agricultural College, 1921-23; professor of political economy in the New School for Social Research, New York City, after 1923. He served as statistician and expert to many important commissions, and was also adviser to several governmental departments and boards. He wrote *Problems in Accounting*, 1915; *Readings in Economics*, 1915; *Profits, Wages, and Prices*, 1920.

**FRIEDBERG**, **CARL** (1872- ). A noted German pianist, born at Bingen. He received his musical education at the Hoch Conservatory in Frankfurt under Knorr, Kwast, and Clara Schumann, and later attended the University of Heidelberg. He made his début in Vienna in 1892. During 1893-1904 he taught at the Hoch Conservatory, and from then until 1914 at the Cologne Conservatory. At the outbreak of the World War, he came to the United States, where he immediately established himself in popular favor. In 1916 he was appointed professor at the Institute of Musical Art in New York. Since 1918 he has divided his time between Munich and New York, teaching and in concert tours. He is unsurpassed for his poetic interpretations of the romantic composers, especially Schumann, and equally remarkable as an ensemble player. With Carl Flesch and Hugo Becker, he formed a trio which has become internationally famous.

**FRIEDMAN**, **IGNAZ** (1882- ). A famous Polish pianist and composer, born at Podgorze, near Cracow. After completing his academic education in his native city, he studied composition in 1900 under Riemann in Leipzig, and then went to Vienna to develop his remarkable pianistic talent under Leschetizky, making his début

there in 1904. Since then, he has met with great success in all the civilized countries of the globe, and is especially famous as an interpreter of Chopin. He first visited the United States in 1920, and at once established himself in the favor of the public. His compositions, entirely free from any modernistic influences, possess sterling merit. He has written a piano concerto, a piano quintet, songs and numerous pieces for piano solo. He is the editor of the great Chopin edition published by Breitkopf & Härtel, as well as of the Schumann and Liszt editions published by the Universal Edition.

**FRIENDS, RELIGIOUS SOCIETY OF.** The Friends, commonly known as Quakers, are composed of four branches: The Society of Friends (Orthodox), Society of Friends (Hicksite), Orthodox Conservative Friends (Wilburite) and Friends (Primitive). The Orthodox branch, which is by far the largest, decreased from 92,379 in 1916 to approximately 81,000 in 1928. This group organized, in 1902, the Five Years' Meeting which maintained, by 1929, seven colleges. *The American Friend*, a weekly, is the periodical of the denomination. The Hicksites, or Liberals, who separated in 1827, following Elias Hicks, had 17,170 members in 1916, and 16,560 in 1928. They publish *Friends' Intelligencer*, and a children's monthly, *The Scattered Seeds*. The membership of the Wilburites decreased from 3373 in 1916 to 2966 in 1926, and the Primitive Friends had two churches with 60 members in 1916, and one church with 25 members in 1926. In recent years, the various branches of the Friends in America have worked together, and cooperated with the Friends in England, maintaining several joint organizations. The Hicksite and Orthodox members held their first service together in over a hundred years at New York, in May, 1928. A conference of all branches of the Religious Society of Friends was held at Oskaloosa, Iowa, in 1929.

**FRIES, AMOS ALFRED** (1873- ). An American soldier and engineer, born in Vernon County, Wis. Appointed in 1894 to the U. S. Military Academy, he was graduated seventh in his class. His first army service was in the Philippines under Pershing against the Moros. He was made 1st lieutenant (1901), captain (1904), major (1912), colonel (1917), brigadier general (1918), and major general (1925). In 1911-14 he was director of military engineering at the Engineers' School, Washington Barracks, and edited *Professional Memoirs*, the official publication of the Corps of Engineers. For several years, he was in charge of the building of roads, fortifications, jetties, breakwaters, and dredging of the Colorado River, but his most conspicuous service in this period was in completing the improvement of Los Angeles Harbor in San Pedro Bay. Going to Europe in 1917, he was made chief of the Gas Service—a unit that developed under his direction into the Chemical Warfare Service, which at the Armistice had 600 officers and 3000 men. He was awarded the Cross of the Legion of Honor (1918), the Cross of the Companions of St. Michael and St. George (1919), and the D. S. M. (1920). After the World War, he was in command of Edgewood Arsenal in Maryland, and from 1920 he was Chief of the Chemical War Service. He was retired on his own application in 1929.

**FRIES, ARCHIBALD** (1864- ). An American railway official, born in Cincinnati, Ohio. He was educated in the public schools of that

city and began his railroad employ in a clerical capacity with the Ohio & Mississippi Railroad. For several years he was employed in various important capacities by the Baltimore & Ohio Railroad and served as general traffic manager of the Eastern Lines, 1916-18. His jurisdiction was extended over the entire system. During the World War, he served as traffic manager to the Railroad Administration. Since 1920 he has been vice president in charge of traffic and commercial development of the B. & O. system.

**FRIESEKE, FREDERICK CARL** (1874- ). An American painter (see VOL. IX). Among other recognitions received by him during the period, were a grand prize at the Panama-Pacific Exposition, in 1915, also the Palmer Gold Medal, Art Institute of Chicago, in 1920; and a gold medal, Philadelphia Art Club, in 1922. In his later works, among them "The Blue Gown," "Golden Locket," "Lady in Rose," he was still decidedly the impressionist chiefly interested in representing female figures and the nude.

**FRISCHEISEN-KOHLER, FRISH'IZÉN-KÖLÉR, MAX** (1878- ). A German professor of philosophy and pedagogy. His works include *Problems des Ewigen Friedens* (1915), *Grenzen der Experimentalen Methode* (1918), and *Simmel* (1919); he edited Ueberweg's *History of Philosophy* and translated the works of Shaftesbury and Hobbes.

**FRITCH, LOUIS CHARLTON** (1869- ). An American engineer, born in Springfield, Ill. He took an engineering course at the University of Cincinnati and was division engineer of the Baltimore & Ohio Railroad in that city until 1899, when he became superintendent. He acted successively as assistant to the general manager, assistant to the president, and consulting engineer for the Illinois Central Railroad until 1909, when he became chief engineer of the Chicago Great Western Railroad. From 1914 to 1917, he was general manager for the Canadian Northern Railway and was general manager for the S. A. L. Railway, Norfolk, Va., 1917-18, and vice president of the Chicago, Rock Island & Pacific Railway after 1918. He was president also of the Rock Island & Oklahoma Railway Company and several other important corporations.

**FROST, ROBERT** (1875- ). An American poet born in San Francisco and educated at Dartmouth and Harvard. After teaching English in the Pinkerton Academy (Derry, N. H.) and teaching psychology (1911-12) at the New Hampshire Normal School, he went to England and published there his first two volumes of prose. On his return to America, he did some active farming at Derry, N. H., and culled therefrom a knowledge of rural life in New England, as was illustrated in his *North of Boston* (1914), which immediately placed him in the front rank of contemporary American poets. In most cases, his pictures of Yankee shyness prove an intimate understanding and love of his neighbors which could come only through close contact. And in his hands, the folk speech of these people possesses a beautiful and melancholy dignity. In 1916-20, he was professor of English at Amherst College; then was poet in residence at the University of Michigan; and in 1923 returned to the faculty of Amherst. He also has written *A Boy's Will* (1913), *Mountain Interval* (1916), *New Hampshire* (1923), *A New Book of Lyrics*

(1928), *West-Running Brook* (1928), and many poems for the magazines. He won the Pulitzer Prize for poetry in 1924.

**FROTHINGHAM, PAUL REVERE** (1864-1926). An American clergyman, born at Jamaica Plain, Mass., and educated at Harvard University. After preaching for some years at New Bedford, Mass., he became minister of the Arlington Street (Unitarian) Church in Boston in 1900. He was preacher to Harvard University at various periods between 1899 and 1921. He was the author of *William Ellery Channing: His Messages from the Spirit* (1907); *A Confusion of Tongues* (1917); *We Believe* (1917); *Our Debt to Great Britain* (1919); *Edward Everett, Orator and Statesman* (1925).

**FRUIT.** See **HORTICULTURE**.

**FRYATT, CHARLES** (1872-1916). A British sea-captain, born near Harwich, Essex. In 1904 he became chief officer in the service of vessels of the Great Eastern Railway Company. During the first two years of the World War, he captained the *Brussels* between Harwich and Rotterdam. His ship was captured by the Germans and he was executed at Bruges on July 28, 1916.

**FUAD I, fū'ād, (AHMED FUAD PASHA)** (1868- ). King of Egypt, son of the late Khedive Ismail Pasha. He became Sultan on Oct. 9, 1917, and after the termination of the British Protectorate over Egypt in February, 1922, he was proclaimed king (March 16). He made a tour of London and other European capitals in 1927. King Fuad was the eighth ruler of the dynasty of Muhammad Ali, who made himself absolute ruler of Egypt by force of arms in 1805.

**FUCHS, fuks, Emil** (1866- ). An American sculptor, painter, and medallist, who was born in Vienna and studied under Tilgner and later in the academies of Vienna and Berlin. He spent five years in Rome, won the gold medal at Munich with the group "Mother Love," in 1890, and then executed a series of important commissions for the British royal family. In 1905 he went to the United States, where he became a naturalized citizen in 1924. He designed medals for the Hudson-Fulton Celebration, and the Hispanic and Numismatic societies, and executed the J. Pierpont Morgan Memorial Medal, and painted a number of portraits of distinguished men and of society women. He wrote *With Pencil, Brush, and Chisel* (1925).

**FUEL.** See **CHEMISTRY, APPLIED**; **BOILERS**; **COAL**; **MOTOR VEHICLES**; **PETROLEUM**.

**FUEL SHIP.** See **VESSEL NAVAL**.

**FUERTE, LOUIS AGASSIZ** (1874-1927). An American illustrator and mural painter (see Vol. IX). In his specialized field, bird and animal life, he illustrated several series for the *National Geographic Magazine*, 1914-19; Burgess's *Bird Book for Children* (1917), and Burgess's *Animal Book for Children* (1920); and executed paintings for the New York Zoological Society.

**FULDA, fūl'dā, Ludwig** (1862- ). A German dramatist and translator (see Vol. IX). His later plays include *Unter Uns* (1912), and *Der Dummkopf* (1928). He added to his translations Shakspeare's *Sonnets* and Ibsen's *Peer Gynt*, and edited *Arabian Nights*, a collection of Spanish comedies, and an anthology of epigrams.

**FULLERTON, GEORGE STUART** (1859-1925). An American professor of philosophy (see Vol. IX). His Columbia professorship ended in 1917.

His works after 1914 include *Germany of To-day*, a defense (1915), and a *Handbook of Ethical Theory* (1922).

**FUNCTIONALISM.** See **BEHAVIORISM**.

**FUNDAMENTALISM.** See **RELIGIOUS CONTROVERSIES**.

**FUNK, CASIMIR** (1884- ). A Polish biochemist, born in Warsaw, who is credited with the discovery of the vitamins. He received the degree of Ph.D. from the University of Berne in 1904 and during the next two years did research work in the Pasteur Institute, Paris. From 1906 to 1910, he was an assistant of Abderhalden's at Berlin and later did research work at the Lister Institute, London. Coming to the United States, he was for a time engaged in research work on cancer at Cornell University and later (1917-23) was chief biochemist to the firm of Metz & Co., New York. In 1921 he also became assistant professor of biochemistry at Columbia. When the State School of Hygiene was established at Warsaw in 1923, he was called to the chair of biochemistry. From 1910 to 1919, Funk wrote 28 papers on the vitamins, alone or in collaboration. His monograph *Die Vitamine* was published in German in 1914.

**FURMAN, FRANKLIN DERONDE** (1870- ). An American engineer and educator, born in Ridgely, Md. He graduated from the Stevens Institute of Technology in 1893, and from the same year was successively instructor, assistant professor, and professor of mechanism and machine design at that institution. He was a member of several engineering societies and wrote *History of the Stevens Family of Engineers*; *History of Stevens Institute of Technology*; *Questions and Problems in Machine Design*; *Questions in Engineering Drawing, Cam, Elementary and Advanced* (1921); *Planetary Gearing* (1924). He also contributed articles to magazines.

**FURNESS, CAROLINE ELLEN** (1869- ). An American astronomer and educator, born in Cleveland, Ohio. She graduated from Vassar College in 1891 and took post-graduate courses at Columbia. She became a member of the faculty of Vassar College and after 1915 was Maria Mitchell professor. She performed research work at the Yerkes Observatory and in Europe. She was the author of several star catalogues and *Introduction to the Study of Variable Stars* (1915). She also contributed articles to American and European journals.

**FURNISS, HARRY** (1854-1925). A British caricaturist, artist, author, and lecturer (see Vol. IX). Among his later works were *Our Lady Cinema* (1914); *More about How to Draw in Pen and Ink* (1915); *Deceit, a reply to "Deceit"* (1917); *Stiggins* (1920); *Some Victorian Women (Good, Bad, and Indifferent)* (1923); and *Some Victorian Men* (1924). He also gave many humorous lectures throughout England, and wrote numerous scenarios.

**FURTWÄNGLER, WILHELM** (1886- ). A noted German orchestral conductor, born in Berlin. Having completed his studies in Munich under Beer-Walbrunn, Rheinberger, and Schillings, he began his career in Zurich. From 1911 to 1914, he was principal conductor at the Opera in Lübeck, directing also the concerts of the Verein der Musikfreunde. In 1915 he succeeded Bodanzky in Mannheim, where he remained four years and established a reputation which brought him invitations for guest-appearances with the foremost German and Austrian

orchestras. He was regular conductor of the Vienna Tonkünstlerorchester (1919-20) and of the symphony concerts of the Berlin Staatsoper (1920-22), succeeding Richard Strauss. In 1922 he was chosen Nikisch's successor as conductor of the famous Gewandhaus concerts in Leipzig and of the Philharmonische Gesellschaft in Berlin. In 1923 he aroused great enthusiasm in London, so that for the season of 1924-25 he was engaged by the Royal Philharmonic Society and the London Symphony Orchestra to conduct several of their concerts. On Jan. 3, 1925, he made his American début with the New York Philharmonic Society with overwhelming success, leading to his engagement as regular conductor for the spring seasons of 1926 and 1927.

**FUTURISM.** See MUSIC; PAINTING; and SCULPTURE.

**FYFE, H. HAMILTON** (1869- ). An English author and journalist, born in London and

educated at Fettes College in Edinburgh. His career in journalism started as a reporter on the *Times* in 1889, and after 13 years of holding positions as sub-editor, reviewer, dramatic critic, etc., he edited the *Morning Advertiser* (1902-03), and *The Daily Mirror* (1903-07), subsequently becoming dramatic critic for the *World* (1905-10), and special correspondent of the *Daily Mail* (1907-18). He was a war correspondent (1914-18), honorary attaché in the British War Mission to the United States (1917), lectured throughout Great Britain (1918-22), and edited the *Daily Herald* (1922-26). He published many books and plays, which include *A. W. Pinero* (1902); *A Modern Aspasia* (play, 1909); *The Real Mexico* (1914); *Petrograd* (1916); *The Meaning of the World Revolution* (1919); *The Widow's Cruse* (1920); *The Making of an Optimist* (1921); *Behind the Scenes of the Great Strike* (1926); *The Religion of an Optimist* (1927), and *The British Liberal Party* (1928).

**GABRILÓWITSCH, OSSIP** (SALOMONOVITSCH (1878— ). A Russian pianist (see VOL. IX). Besides being recognized as one of the greatest pianists of his day, he won fame as an orchestral conductor. From 1910 to 1914, he was conductor of the Konzertverein in Munich, but he did not abandon his career as a pianist. During 1912-13 he won veritable triumphs in several European capitals with his series of six historical concerts illustrating the development of the piano concerto from Bach to Rachmaninov. After the outbreak of the World War, he went to the United States giving the same cycle and arousing the same enthusiasm. In 1918 he became conductor of the Detroit Symphony Orchestra. He has also appeared frequently as guest-conductor with several of the great symphony orchestras.

**GAILOR, THOMAS FRANK** (1856— ). An American Protestant Episcopal bishop (see VOL. IX). He became chairman of the House of Bishops of the Protestant Episcopal Church in 1916, Presiding Bishop, 1919-26, and president of the National Council, 1922-25. He has received honorary degrees from Oxford (1920) and Oglethorpe University (1921).

**GÄL, HANS** (1890— ). An Austrian composer, born at Brunn. He studied in Vienna under Mandyczewski and Adler, and in 1918 became lecturer on musical theory at the university. In 1915 he won the Austrian State Prize with his first symphony. His works include the operas, *Der Arzt der Sobeide* (Breslau, 1919), *Die heilige Ente* (Düsseldorf, 1923), and *Das Lied der Nacht* (Breslau, 1926); the choral works with orchestra, *Von ewiger Freude*, *Vom Bäumlein das andere Blätter hat gewollt*, *Phantasien*, *Requiem für Mignon*; incidental music to Levetzow's *Ruth*; choruses a cappella and much chamber music. He also is the author of *Anleitung zum Partiturlernen* (1923).

**GALE, ZONA** (MRS. WILLIAM BREESE) (1874— ). An American writer (see VOL. IX). She wrote *Neighborhood Stories* (1914); *Heart's Kindred* (1915); *A Daughter of To-Morrow* (1917); *Birth* (1918); *Peace in Friendship Village* (1919); *The Secret Way* (verse, 1921); *The Neighbors*, a one-act play; *Miss Lulu Bett*, the dramatic version of which received the Pulitzer Prize of \$1000 as the best play of the year produced in New York (1920); *Faint Perfume* (1923); *Preface to a Life* (1926); *Yellow Gentians and Blue* (1927); *Portage, Wisconsin* (1928); *Borgia* (1929). *Mister Pitt*, a dramatized version of *Birth*, was produced in New York in 1924. In 1928 Miss Gale was married to William Breese.

**GALICIA, gá-lísh'ya, EAST.** In the determination of the southeastern boundary of Poland, and in particular the disposition of the former Austrian province of Galicia, the Peace Conference following the World War was confronted by one of its most vexing problems. In fact

it was not until March, 1923, that the matter could be considered as settled, and then only after a fashion. The question of West Galicia roused little controversy; the district was solidly Polish, and the Supreme Council, in assigning it to Poland by the "Certain Frontiers" Treaty of Aug. 10, 1920, was clearly recognizing Polish historical and ethnical rights. But the eastern two-thirds of the province raised other questions. In East Galicia, the majority of the inhabitants were Ruthenians, i.e., Ukrainians; the 1910 census showed a population made up of 59 per cent of Ruthenians, 27 per cent Poles, and 13 per cent Jews. Besides the question of race, religious and cultural antipathies existed. The Poles are Roman Catholic; the Ruthenians, Greek Orthodox Uniate. Ruthenian interest centred in the question of race, while the Poles, in addition to their cultural and commercial dominance, sought East Galicia for military and economic reasons.

The Peace Conference had tried valiantly to cope with the problem. Undoubtedly, as the British contended, the Ruthenians were entitled to some sort of self-determination, and it was manifestly unfair to cede the territory to Poland outright. No group, however, seemed willingly to consider a transfer of East Galicia east of the Lemberg-Drohobycz line to Russia. But the Poles presented the delegations with a *fait accompli*, and it was no doubt with relief that on June 19 the Poles were authorized to continue their military occupation of the whole country. Plain justice, nevertheless, demanded a consideration of Ruthenian claims, and to the end of 1919 the Supreme Council concerned itself with plans for the guarantee of Ruthenian autonomy. But the French succeeded in blocking all these attempts. Undoubtedly, the just disposition of the province had presented almost insuperable obstacles; the League of Nations could not handle the task in 1919, for it was not yet functioning, while none of the European powers was in a position to take up the onerous duty of protection and administration in a region where hatreds were so implacable. As things were, 4,500,000 Ruthenians were under the domination of a Polish minority, with no provision for the protection of their liberties or the ascertainment of their wishes. On Mar. 14, 1923, the capstone was placed on the situation when the Council of Ambassadors, in definitely laying down the boundaries of Poland, assigned East Galicia to Poland. See POLAND, under *History*; WORLD WAR.

**GALLAGHER, MICHAEL JAMES** (1860— ). A Roman Catholic bishop, born at Auburn, Mich., and educated at Mungret College, Limerick, Ireland, and at the University of Innsbruck, Austria. He was ordained priest in 1893, and after filling several pastorates and holding various offices, he became bishop of Grand Rapids in 1916. In 1918 he was transferred to Detroit.

**GALLI-CURCI, AMELITA** (1889— ). A brilliant Italian coloratura soprano, born at Milan. Among the world's great singers, pres-

ent or past, her case is without parallel as the only example of an artist achieving distinction without technical training under a teacher. While studying at the Conservatory in Milan, she devoted herself exclusively to the piano, under Appiani, with the ambition of becoming a pianist, and with such success that in 1903 she won the first prize. Later, on discovering that she was gifted with a fine natural voice, she began a unique system of self-instruction. She had records made of her voice, and these she studied carefully, her exceptionally keen ear enabling her to discover and remedy imperfections. However, she acknowledged her indebtedness to Mascagni and William Thorner for advice. In 1909 she made her debut as Gilda in *Rigoletto* at the Teatro Costanzi, in Rome, winning instantaneous success, which secured her appearances at several important Italian opera houses during the same year. The next year she made her first tour of South America, after which she sang again in Italy. In 1912 she was again in South America; in 1914 she made her first tour of Spain, and in 1915 she sang in Havana. Then came her sensational success with the Chicago Opera Association (Nov. 18, 1916), of which she was a regular member until 1924. But all these triumphs were eclipsed by the ovations she received at her first appearance in New York (Jan. 28, 1918), when the Chicago company visited the metropolis for a four weeks' season. These visits were repeated annually till 1922. Beginning with 1923 Galli-Curci appeared every season as guest artist at the Metropolitan Opera House. London did not hear her till the fall of 1924. She was married in 1910 to the painter Luigi Curci, whom she divorced in 1920. In 1921 she married Homer Samuels, her accompanist.

**GALLIÉNI**, gál'yá'nē', JOSEPH SIMON (1849-1916). A French general and statesman (see Vol. IX), who was military governor of Paris from Aug. 27, 1914, until October, 1915, when he entered Briand's cabinet as Minister of War. Ill health forced his resignation in March 1916, and he died on May 27 of that year. In 1920 *Mémoires du Général Galliéni; défense de Paris* was published. Consult *Galliéni parle* by Leblond (2 vols., 1920), and *Galliéni, 1849-1916*, by Gheusi (1921). See WORLD WAR, under *Western Front*.

**GALLIOLI**. See WORLD WAR, under *Turkish Front*.

**GALLOWAY**, BEVERLY THOMAS (1863- ). An American botanist (see Vol. IX). In 1913-14 he was Assistant Secretary of Agriculture, and in 1914-16, dean of the State College of Agriculture of Cornell University. After the latter date, he was pathologist of the office of seed and plant introduction for the United States Department of Agriculture.

**GALLOWAY**, CHARLES WILLIAM (1868- ). An American railway official, born in Baltimore, Md. He began his railway career as a messenger in the telegraph department of the Baltimore & Ohio Railroad in 1883. He served that road in various capacities and became superintendent of transportation in Baltimore in 1906. He served as general manager of the Baltimore & Ohio from 1912 to 1916 and as vice president and general manager of the Baltimore & Ohio Southwestern from 1916 to 1918. He was Federal manager for the Western lines of several railways during the World War, and after 1920 was vice president in charge

of operation and maintenance for the Baltimore & Ohio system.

**GALLSTONE DISEASE**. New methods of diagnosis and treatment of gallstone disease have been introduced by Dr. Lyon of Philadelphia and his disciples, which were incorporated in his large monograph on non-surgical drainage. By means of the duodenal sound, it is possible to obtain bile under all kinds of circumstances and subject it to analysis. The discovery that the bile in gallstone disease may be entirely normal is contrary to the old belief that stones cannot form in the presence of healthy bile. The chologogue action of various substances can be studied by introducing them into the duodenum through the stomach and watching their action on the flow of bile. It becomes evident that the empirically recognized chologogue substances are scientifically justified, for magnesium sulphate, olive oil, sodium phosphate, and a number of other substances appear to possess this property of expelling bile from the gall bladder into the duodenum. It is also possible by means of any one of these substances introduced into the duodenum to cause the escape of stones, or what is better, to prevent their formation by occasional resort to the sound.

The claim that the use of the latter may sometimes precipitate a severe attack of gallstone colic in a patient in whom the stones might never have caused trouble if left alone may be viewed from various angles. Thus, we may entirely disbelieve in this possibility in the absence of complete proofs, or we may look on it as a rare event of little practical importance to the public at large; finally, we may regard the expulsion of a quiescent stone as a good thing.

Following closely upon the introduction of the method of non-surgical drainage or duodenal tube for the prevention and cure of gallstone disease another revolutionary advance has been made, this time chiefly in the domain of diagnosis and of radiographic diagnosis. While no advance has been made in increasing the visibility of gallstones, a very marked one is to be heralded as increasing the visibility of the gall bladder, both normal and diseased. The chief credit for this innovation goes to Dr. Graham, St. Louis surgeon, and its designation is "cholecystography." The earliest reports go back to 1925 and the full description of the method is found in the literature of 1926. A writer of the period sums up the discovery as follows: "Cholecystography is a new method of investigating the biliary system based on the ability of the liver to excrete certain dyes which are opaque to the X-rays. It is a means of studying the topography of the gall bladder in the living; throws light on its physiology; is of value in deciding the indication for operation; and is of equal value with the opaque meal in disease of the digestive tract and pyelography in urinary diagnosis." The rapid advance in the technique and the universal adoption of the method are quite characteristic of the age.

**GALLWITZ**, gál'wítz, MAX C. W. VON (1852- ). A German artillery general, born at Breslau, and educated at the Gymnasium and military academy. He entered the artillery service in 1870 and was progressively promoted until he became lieutenant colonel in 1896. He was made department chief in the War Ministry the following year and major general in 1902. In 1903 he had the direction of the army in the War Ministry; in 1906 he was made commander

of the 15th Division; and in 1911, general of artillery and inspector of field artillery. During the entire period of the World War, he was artillery corps commander. In 1918 he was made commander-in-chief of several armies. He was raised to the nobility in 1913. From 1920 to 1924, he was a Nationalist member of the Reichstag.

**GALSWORTHY, göłzwúr-TH I, JOHN** (1867- ). An English author (see VOL. IX). In June, 1929, he was decorated with the Order of Merit. Among his later works are *The Little Man and Other Satires* (1915); *The Freelanders* (1915); *A Sheaf* (vol. i, 1916; vol. ii, 1919); *Beyond* (1917); *Five Tales* (1918); *Saint's Progress* (1919); *Addresses in America* (1919); *Tatterdemalion* (1920); *Captures* (1923); *Caravan* (a collection of short stories, 1925); *Verses New and Old* (1926); *The Forsyte Saga* (1922); *The White Monkey* (1924); *The Silver Spoon* (1926); *Two Forsyte Interludes* (1928); and *Swan Song* (1928), four novels about *Forsyte Saga* characters, which were combined and published under the title *A Modern Comedy* (1929). Also the plays, *The Mob* (1914); *A Bit o' Love* (1915); *The Skin Game* (1920); *Six Short Plays* (1921); *Loyalties* (1922); *Old English* (1924); *The Show* (1925), *Escape* (1926). In all his later works appear the author's usual intellectual fineness and careful and thoughtful weaving. For additional information consult a biography: *John Galsworthy, A Survey*, by Leon Schalit (1929).

**GAMBIA.** A British colony and protectorate at the mouth of the River Gambia in West Africa. Area of colony proper, 4 square miles, (population 10,000); area of the protectorate 4130 square miles (population in 1921, 200,000). The chief export from Gambia is groundnuts, with a total valued at £97,941 in 1927. This made up 96 per cent of the total shipments. Other exports are palm kernels and hides. Total exports for 1927, £999,887, as compared with £926,127 in 1914. Imports for 1927 were £956,741 as compared with £688,097 in 1914. In 1913, 625,132 tons entered and cleared; in 1927, 1,284,664 tons. Revenues in 1913 were £124,990; 1926, £252,419. Expenditures in 1913 were £95,210; 1926, £277,625. The last figure includes £50,000 set aside for establishment of a Reserve Fund. The natives persisted in devoting themselves exclusively to the groundnut industry to the neglect of food crops. During the World War this caused a real food stringency because of the lack of shipping.

**GANDHI, MOHANDAS KARAMCHAND** (1869- ). An Indian nationalist leader, born at Porbandar, India. He went to London in 1888 to study law. After careful observation of Christianity and Western civilization, he returned to India in 1893, but soon afterward went to South Africa to practice law. Mistreated by the white men in South Africa, he developed a philosophy of passive resistance.

Nevertheless, during the World War, he raised Indian recruits in London and Kheda, except during his retreat in 1916 at Ahmadabad, where he came under the influence of the teachings of Tolstoy. In March, 1919, the Government put into operation the Rowlatt Act, which suspended civil rights and established martial law in any part of India where disturbances took place. In the same year occurred the shooting at Amritsar of 300 Indians by British troops. These events led Gandhi to start the non-

coöperative movement, in which British goods, titles, courts, education, public functions, and political life were boycotted. The Mohammedans, enraged at the division of the Moslem holy places of Turkey between Great Britain, France, and Greece, joined the movement. Gandhi was appointed by the All-India Congress of December, 1921, as sole executive of the non-coöperative forces.

For his part in various disturbances, he was tried in March, 1922, and sentenced to prison for six years. Many feared a gigantic uprising, but Gandhi admonished his followers not to resort to arms. He went to prison cheerfully and no disturbance occurred. During his imprisonment, the Nationalist movement took another direction, and Gandhi's influence declined. In 1926 he announced his temporary retirement from politics. On Mar. 4, 1929, he was arrested after a riot in Calcutta caused by the burning of foreign cloth. From time to time, his theories and speeches were published. Consult *Mahatma Gandhi*, by Romain Rolland (1924), and *Lenin and Gandhi*, by René Fülöp-Miller (1928). See INDIA, under *History*.

**GANS VON LUDASZY, JULIUS** (1838-1923). An Austrian journalist and author, born in Vienna. He was editor of the *Wiener Neue Freie Presse* from 1902 to 1915. His first publication was a thesis, *Die Wirtschaftliche Energie: System der Oekonomistischen Methodologie* (1893). He later published *Also Sprach Confucius* (1900). Thereafter, he devoted himself to drama and fiction. Among his plays, most of which were produced in Vienna, are *Bessere Leute* (1902), *Der Sonnenstaat* (1904), and *Die Trennende Brücke* (1913); among his stories, *Die Heilige Schlange* (1912), *Die Macht der Schatten* (1914), *Die Grosse Sünde* (1915), *Der Tanzende Stern* (1917), and *Der Turm der Liebe* (1920).

**GANT, SAMUEL GOODWIN** (1869- ). An American surgeon and proctologist, born at Knoxville, Mo., and educated at the Missouri Medical College. He practiced for some years in Kansas City, Mo. In 1899 he removed to New York City to become professor of surgery (proctology) in the Broad Street Hospital Postgraduate School of Medicine. For some years, he conducted private surgical hospitals. He published numerous works covering diseases of the colon, rectum, and intestinal tract: *Diagnosis and Treatment of Diseases of the Rectum* (1896; rev. 1902); *Constipation and Intestinal Obstruction* (1909), reissued in 1916 in revised form as *Constipation, Obstipation, and Intestinal Stasis; Diarrheal, Inflammatory, Obstructive, and Parasitic Diseases of the Gastro-intestinal Tract* (1915); and *Diseases of the Rectum, Anus, and Colon* (3 vols., 1923).

**GANZ, RUDOLF** (1877- ). A Swiss pianist (see VOL. IX). In 1921 he transferred his main activity from the field of piano playing to that of conducting, when he accepted the conductorship of the St. Louis Symphony Orchestra, which he directed until 1927. After his election as vice president of the Chicago Musical College, in 1928, he took up his residence in that city.

#### GARBAGE AND REFUSE DISPOSAL.

The net changes in garbage and refuse disposal since 1914 left the various processes in much the same relation to each other as at the beginning of the period, with a strong trend toward incineration, and a falling off of reduction and

hog feeding (garbage only), although the latter is still extensively practiced. The most extensive statistics on garbage and refuse collection and disposal ever made available in the United States were gathered by the United States Food Administration in 1917. They covered, as far as possible, places of 10,000 population and over. See discussion in *Engineering News-Record*, Oct. 17, 1918.

In the United States, probably in much lesser degree in other countries, garbage and refuse disposal is in many respects the most unsatisfactory of the various municipal services. In Europe, work in this field is on a more permanent and generally satisfactory basis than in the United States. It is not so much the collection service that is bad in America, although that is incomplete in a large percentage of municipalities and often poor, as it is the final means of disposal. The incompleteness of the American service, both as to collection and disposal, is in part due to the variety and extent of the demands on American municipal treasuries, but the poorness of the service performed and the constant shifting from one method of disposal to another and the very frequent abandonment or at best the very poor operation of disposal plants is due most of all to the failure of American cities to regard the garbage and refuse disposal service, and for that matter the collection service as well, as essentially an engineering problem. Shift from one method of disposal to another, utterly inadequate operating service of disposal plants, and the abandonment of plants representing large capital investments are common; together they result in the waste of very large sums of money. So seldom does a city turn to an engineer experienced in garbage collection and disposal for preliminary studies to determine the best method to be adopted, for the preparation of plans and specifications, and for supervision of contracts, that there are very few engineers specializing in garbage disposal, compared with the large number of waterworks and sewerage specialists.

**Methods of Disposal Outlined.** The chief methods of garbage disposal in use in various parts of the world in 1929 were dumping on land or into water; earth burial or covering with ashes instead of with dirt; incineration, with or without attempts at heat utilization; reduction, for the recovery of grease and fertilizer base, or in rare cases, for the conversion of garbage into stock food, which must still be considered as in the experimental stage; and fermentation, the end-product to be used as a fertilizer, a new method introduced in several Italian cities and tried in a small way in the United States. Although no exact figures are available, it is probable that throughout the world more garbage and other municipal refuse are disposed of by dumping on land or in water than by any other method. Water dumping was long the chief method of disposal practiced by New York City; in 1896 it was given up for disposal by reduction, but in 1918, with a political change in administration it was returned to for a considerable part of the city. In Richmond and Queens boroughs, most of the New York garbage is disposed of by incineration. Early in 1924, a 300-ton incinerating plant was put in use in Manhattan Borough; since then, two similar plants have been built in that borough, and in 1928 four more were authorized. In the same year, contracts were

let for three 500-ton incinerators for the Borough of Brooklyn, where two 100-ton plants were already in use. Chicago put in use in 1928 a 600-ton incinerator consisting of six 100-ton units. In the same year, New Orleans contracted for three incinerators, in addition to a couple already in use.

The incinerators thus far mentioned have mixed refuse—garbage and rubbish of various sorts. Refuse salvaging stations, for the recovery of salable paper, rags, and other substances, were in use in 1929 at 15 district stations in the Borough of Brooklyn, at two plants in Baltimore, and at one in Los Angeles, Calif. In addition, Los Angeles operated an incinerator for market waste, while its garbage, as stated further on, was sold to a contractor who feeds it to hogs. The land dumping of garbage and refuse, if little or no attempt is made to take the proper care of the dumps, is likely to give offense from odors, from scattering papers, and from smoldering fires in the dumps, but it is possible so to handle the dumps as to keep them from being a nuisance. Earth burial or the depositing of garbage in relatively shallow layers and covering it with a few inches of earth, may be an eminently sanitary and satisfactory method of garbage disposal, but as a rule it is practiced only by small places. A modification of this plan, used by cities large and small in the United States, Canada, and Great Britain, is to dump both garbage and other city refuse in successive layers of considerable depth, keeping the final level covered with dirt or ashes. This method was adopted by Seattle, Wash., after the abandonment of three refuse destructors or incinerators in 1913-15, and similarly at Ottawa, Canada, in 1918. The change from incineration to dumping and covering with earth or ashes at Seattle was made by the Health Department and was called the sanitary fill method of disposal. Mixed refuse dumps or "tips" have the sanction of the British Ministry of Health, which has issued regulations for their sanitary control. Often two objects are accomplished, refuse disposal and reclamation of low land. The plan was adopted at Dundee Scotland in 1928.

Incineration was for several decades the chief method of disposing of mixed refuse in England, where anything but dumping was used, but much British refuse was worked into the soil for its physical improvement and for such fertilizing value as the refuse might contain. Following the War, a marked change was made in British incinerating or refuse destructor practice; instead of sending all the garbage, ashes, and other refuse through the furnaces, the ashes and garbage were screened out for utilization on land; such low-grade commercial materials as paper, rags, etc., were picked out on movable belts, and only the coarser clinker and unburned coal was passed for burning. The same general method was practiced for several years at Paris. (See *Engineering News-Record*, Nov. 22, 1923.) Tests on the refuse of Munich made by the Bavarian State Institute for the Growth and Protection of Plants led to the conclusion that it would be wasteful to use for fuel the finer portions of refuse having low calorific value but rich in fertilizing material. It was concluded that the most economical use of refuse where soil deficient in humus is at hand is to devote sifted-fine refuse to agricultural purposes and to send the remaining refuse only

to the destructor. (*Zeitschrift des Bayerischen Revisionsvereins*, Nos. 7 and 8, 1921).

Reduction as a means of garbage disposal has been confined almost wholly to the United States, where the method was employed during a considerable number of years in most of the larger cities of the country which have what might be called improved means of garbage disposal. Originally, all these reduction works were built and operated by private companies under municipal contracts, but for some years, one after another was taken over by the city or else, in a few cases, municipal plants were built *de novo* or to replace the old privately owned plants. In 1929 there were municipally owned reduction plants in Schenectady, Syracuse, and Rochester, N. Y.; Philadelphia and Washington; Cleveland, Columbus, and Dayton, Ohio; Indianapolis, Ind., and Chicago. Such a plant at New Bedford, Mass., burned down in 1924 and was succeeded by an incinerator. The Syracuse plant was leased for operation for a second five-year term in 1928 to the contractor who built it. At Chicago, the garbage from a large district was deviated in 1928 to a new 600-ton incinerator, built in part because the reduction works were inadequate for the increased population and partly because incinerators were considered more economical under increased operating costs and decreased operating revenues due to a fall in the price of the grease and tankage produced by the reduction works. Other cities where the garbage was being disposed of by reduction in 1929 were Boston, Baltimore, Pittsburgh, and Detroit, in each case by private companies. Where reduction is practiced, only garbage, not mixed refuse, can be disposed of. The same is almost as true of disposal by feeding to hogs, although these animals will do much sorting over of mixed refuse.

Hog feeding as a method of garbage disposal is the general means which is employed throughout New England, and in many other cities throughout the United States, notably by the contractor for the disposal of the garbage of Los Angeles, Calif., who receives the garbage at a railway station, has it transported to the country, and feeds it to some 40,000 market hogs, under approved sanitary conditions and with the use of carefully devised mechanical appliances for distributing the garbage to the hogs, recovering, drying, and pulverizing the hog manure. (See *Engineering News-Record*, May 3, 1928, P. 692.) A corresponding method was long practiced at Providence, R. I., and Worcester, Mass., but in 1927 was superseded by incineration at Providence.

Fermentation by the *Beccari System*, named after an Italian, was practiced in Florence and some other Italian cities for several years. A demonstration plant was built by American promoters of the process at Paterson, N. J., in 1921. Late in 1923, a working-scale Beccari plant was put in operation by the village of Scarsdale, N. Y. This was followed in 1928 by a small plant at Dunedin, Fla. After a short period of use, the Scarsdale plant was shut down, on court order following complaint of nuisance; it was rebuilt along somewhat changed lines. At both these plants, the garbage is dumped into covered concrete cells from which the moisture in the garbage is drained out through a false bottom. Reports from the Italian plants are that after the garbage has remained in them for 30 days or so, it has been converted by fermenta-

tion to a substance similar to garden soil or humus, with a high fertilizing value. A considerably longer detention period is required for American garbage. For a description of the Beccari system as used in Italy, see *Engineering News-Record*, Feb. 15, 1923. For a description of the plant at Florence, Italy, see *The American City*, February, 1923, and for particulars of the Dunedin plant, consult the same journal for February, 1929.

Collection of mixed refuse generally costs more than the final disposal of the material; for economical service both of collection and of disposal, the two should be carefully correlated after engineering studies, which should be continuous in order to make readjustments necessary for economy and efficiency. Increasingly, motor-drawn vehicles are being used for collection, especially where there is a long haul after loading is completed. Theoretically, refuse collection districts should be so laid out that the material collected could be hauled to a central disposal plant in each district; this would materially reduce the haul as compared with that entailed by the use of only one disposal plant. Great practical difficulty is experienced in American cities when an attempt is made to locate district disposal plants; the people residing or doing business in the immediate vicinity usually protest that the plant will be a nuisance. The arguments advanced may be fallacious, but, when brought to bear on the councilman, they are likely to be effective, as was shown by experiences at Philadelphia, Minneapolis, and St. Louis. Most disposal plants in America are located in the outskirts of the city or beyond the municipal boundary lines, but in New York City the incinerators are being located each to serve a district. In some cases the disposal plant is so remote that special transportation after house-to-house collection has been effected is required, making use either of trailers or even or railway transportation, steam or electric. Although published some years ago, the most comprehensive book on this whole subject is Hering and Greeley's *Collection and Disposal of Municipal Refuse* (New York City, 1921). Among several British books is Thompson, *Modern Cleansing Practice* (London (1928)).

**GARBER, DANIEL** (1880- ). An American painter (see VOL. IX). Among his later awards were the first Altman Prize for figure painting, 1917, the first Clark Prize and gold medal, 1921, and the first Altman Prize for landscape (1922 and 1927). In "Buds and Blossoms," "A Summer Phantasy," and "The Hawk's Nest," he showed a continuance of interest in nature in her brighter and sunlit moods.

**GARD, ROGER MARTIN DU.** See **MARTIN DU GARD, ROGER.**

**GARDEN, MARY** (1877- ). An American soprano (see VOL. IX). In January, 1921, she was appointed director general of the Chicago Opera Association. She assumed control under most unfavorable circumstances, when the company was suffering from complications resulting from a dual directorship with divided responsibilities. In spite of all handicaps, she maintained the high standard of the performances and even added to the glory of the company with a tour which was an unequivocal artistic success, though it resulted in financial disaster. During her term as director, she continued to appear in her usual rôles. When the

new Chicago Civic Opera Company was organized in 1922, she was engaged as one of the principal artists.

**GARDEN CITIES.** See CITY AND REGIONAL PLANNING.

**GARDNER, EDMUND GARRATT** (1869- ). An English writer and Italian scholar (see VOL. IX). He was Barlow Lecturer on Dante, University College (1910-26), and Professor of Italian Studies, Manchester University (1919-23), of Early Italian Language and Literature, University of London (1923-25), and of Italian, University of London (1925- ). Among his later works are *The Book of St. Bernard on the Love of God* (1916); *The National Idea in Italian Literature* (1921); *Dante* (1923); *Tommaso Campanella and his Poetry* (1923); *Italian Literature* (1927), and *The Arthurian Legend in Italian Literature* (1928-29).

**GARDNER, ERNEST ARTHUR** (1862- ). An English classical archaeologist (see VOL. IX). He was dean of the faculty of arts, London University, in 1913-15 and vice chancellor in 1924-26. During the World War, he was in active service at Saloniki. His later works are a *Catalogue of the Museum of Oasts of Greek and Roman Sculpture at Birmingham* (1921) a collection made by him, and *The Art of Greece* (1925).

**GARFIELD, HARRY AUGUSTUS** (1863- ). An American college president, born at Hiram, Portage County, Ohio, the son of President James A. Garfield. He taught Latin and law and practiced law from 1888 to 1903 in Cleveland, Ohio. Subsequently, he became professor of politics at Princeton University (1903-08) and president of Williams College (1908- ). He has been chairman of the Institute of Politics, holding summer sessions at Williamstown, since 1920. President Wilson appointed him United States Fuel Administrator in August, 1917. The coal strike settlement did not receive his approbation, and in 1919 he resigned.

**GARIBALDI, gá-ré-bál'dé, GIUSEPPE** (1879- ). An Italian soldier, grandson of the great Garibaldi, born in Melbourne, Australia, and known as Peppino. He took part in the Greco-Turkish War in 1897 and afterward fought with the revolutionists in Venezuela, where he was imprisoned by Castro but escaped. After working on the Panama Canal under General Goethals, he entered the service of Madero in Mexico and was made chief of staff. He served in the Balkan Wars of 1912, and at the outbreak of the World War raised an Italian legion of 14,000, which fought with the Allied troops in France. When Italy entered the War, he joined her army and served with distinction. He was created brigadier general in June, 1918, and retired from the army a year later. He openly denounced the Fascists, and was forced to leave Italy following the establishment of the Fascist regime. He afterward resided principally in France and the United States.

**GARLAND, HAMLIN** (1860- ). An American author (see VOL. IX). Among his publications are *A Son of the Middle Border* (1914), *A Daughter of the Middle Border* (1921), *The Book of the American Indian* (1923), *The Trail Makers* (1926), and *Back Trailers of the Middle Border* (1928). He became a member of the American Academy of Arts and Letters in 1918.

**GARNER, JAMES WILFORD** (1871- ). An American professor of political science (see VOL. IX). Among his later writings are *Civil*

*Government for Indian Students* (1920), *Idées et Institutions Politiques Américaines* (1921), *International Law and the World War*, 2 vols. (1920), *Recent Developments in International Law* (1925), *American Foreign Policies* (1927), and *Political Science and Government* (1927). He edited *Essays on Southern History and Politics* (1914). He was Hyde lecturer in the French universities (1921) and Tagore lecturer in the University of Calcutta (1922). Since 1924 he has been associate editor of the *American Journal of International Law*.

**GARNETT, MRS. CONSTANCE (BLACK)** (1861- ). A British translator from the Russian, mother of David Garnett (q. v.). Her many translations include: All the novels of Ivan Turgenev (1894-96), as well as his *Dream Tales and Prose Poems* (1916) and *The Two Friends and Other Stories* (1921); *The Kingdom of God is Within You* (1894), *Anna Karénina* (1901), and *War and Peace* (1904), by Leo Tolstoy; *The Storm*, a play, by Ostrovsky (1899); *The Revolt of the Potemkin*, by Konstantin Feldmann (1908); all the novels of Feodor Dostoevski and Nikolai Gogol, and most of the plays of Anton Chekhov; *The Letters of Anton Tchekhov to his Family and Friends* (1920); *The Letters of Anton Pavlovitch Tchekhov to Olga Leonardovna Knipper* (1925); *My Past and Thoughts*, being the memoirs of Alexander Herzen (6 vols, 1924-27), and *Margorod*, stories by Gogol (1928).

**GARNETT, DAVID** (1892- ). An English novelist, a partner in the Nonesuch Press, who was educated at the Royal College of Science, South Kensington. He translated and edited *The Kitchen Garden and its Management*, by Professor Gressant. He wrote *Lady Into Fox* (1923), *The Man in the Zoo* (1924), *The Sailor's Return* (1925), and *Go She Must!* (1927).

**GARNETT, PORTER** (1871- ). A writer, critic, and play producer, born in San Francisco. He edited the Grove Plays of the Bohemian Club in 1918 and has published *The Bohemian Panama-Pacific International Exposition, Stately Homes of California*, and *A Documentary Account of the Beginnings of the Laboratory Press* (1927). He became associate professor of graphic arts at Carnegie Institute of Technology in 1922 and established there in 1923 the Laboratory Press, the first private press devoted to educational purposes.

**GAROFALO, gá-rô-fá-lô, RAFFAELE, BARON** (1852- ). An Italian jurist and senator (see VOL. IX). His later publications, many of them speeches before the Senate, include *Sull' Ordinamento Giudiziario* (1914); *La Neutralità dell' Italia* (1914); *Per l'Assicurazione Obbligatoria contro gli Infortuni sul Lavoro in Agricoltura* (1917); "Enrico Pessina, Filosofo e Legislatore" (in vol. xiv of the *Atti della Reale Accademia di Scienze Morali e Politiche*, 1918); and *I Delinquenti Abituati, gli Scioperi, il Bolscevismo* (1919). His *Criminology* (1885) was translated into English (1914) as the seventh volume of *Modern Criminal Science*, and a new and enlarged Italian edition was published in 1922.

**GARRETT, ALEXANDER CHARLES** (1832-1924). An American Protestant Episcopal bishop (see VOL. IX). On the death of Daniel Sylvester Tuttle in April, 1923, he became presiding bishop. At that time, he was 91 years old and totally blind.

**GARRETT, GABET** (1878- ). An American economist and journalist, born at Pana, Ill,

He was financial writer on the New York *Sun* (1903-05), New York *Times* (1906-07), *Wall Street Journal* (1907-08), New York *Evening Post* (1909-12), editor of the New York *Times Annalist* (1912-14), and assistant editor of the New York *Tribune* (1916-19). He has written *Where the Money Grows* (1911), *An Empire Be-leaguered* (1916), *The Blue Wound* (1920), *The Driver* (1921), *The Mad Dollar* (1921), *The Cinder Buggy* (1922), *Satan's Bushel* (1923), *Harangue* (1927), *The American Omen* (1928), and many essays of an economic and political nature. He contributed regularly to the *Saturday Evening Post* and other magazines.

**GARRETT, JOHN WORK** (1872- ). An American diplomat and banker, born in Baltimore and educated at Princeton. He was appointed Ambassador to Italy on Aug. 5, 1929. Mr. Garrett was a secretary to the American legations at The Hague (1901-05), Berlin (1905-08), and Rome (1908-10), and served as Minister to Venezuela (1910-11), to Argentina (1911-14), and to The Netherlands and Luxemburg (1917-19). From 1914 to 1917, he was at the American Embassy in Paris as a special agent of the Department of State, and he was chairman of the special diplomatic mission which negotiated a treaty with Germany regarding prisoners of war, signed Nov. 11, 1918. He also served as secretary general of the Washington Conference on Limitation of Armaments (1921-22). He was a delegate-at-large from Maryland to the Republican National Conventions of 1920 and 1924.

**GARRISON, FIELDING HUDSON** (1870- ). An American physician, known especially as a historian, librarian, and editor, born in Washington, D. C., and educated at Johns Hopkins and Georgetown universities. He entered the army medical service and was made a colonel in the Medical Corps, United States Army, in 1920. He was assistant librarian in the Surgeon General's Library (1889-1922), and editor of the *Index Medicus* from 1903 to 1927, when he became associate editor of the *Quarterly Cumulative Index Medicus*. His chief publications comprise *An Introduction to the History of Medicine* (1913, 3d ed., 1928); *John Shaw Billings, a biography* (1915); *Notes on the History of Military Medicine* (1922); *History of Pediatrics* (1922); *History of Neurology* (1925); and *The Principles of Anatomic Illustration before Vesalius* (1925).

**GARVIE, REV. ALFRED ERNEST** (1861- ). A British Congregationalist theologian (see VOL. IX), principal of Hackney and New College since 1924. He was president of the National Free Church Council (1924-25). His later publications include *The Missionary Obligation* (1914), *The Evangelical Type of Christianity* (1915), *The Purpose of God in Christ* (1919), *The Christian Preacher* (1920), *The Old Testament in the Sunday School* (1921), *The Beloved Disciple* (1922), *The Christian Doctrine of the Godhead* (1925), and *The Preachers of the Church* (1926).

**GARVIN, JAMES LOUIS** (1868- ). An English journalist and Imperialist, born at Birkenhead, Cheshire. By his early writings in various papers, he made himself popular as a brilliant publicist. He was editor of the weekly *Outlook* (1905-06), the evening *Pall Mall Gazette* (1912-15), and *The Observer* (1908- ). The circulation and prestige of the latter increased enormously with his editorship. He pub-

lished *Imperial Reciprocity* (1903), *Compatriot Club Lectures* (1906), *Tariff or Budget* (1909), *The Economic Foundation of Peace* (1919), and other books, the majority of them giving proof of his affinity with the Unionist Party. In 1920 he was appointed to write the official biography of Joseph Chamberlain, whom he had supported since the latter was appointed colonial secretary in 1895.

**GARY, ELBERT HENRY** (1846-1927). An American corporation official (see VOL. IX). In 1917 he was appointed a member of the United States section of the international high commission, later resigning. He remained at the head of the U. S. Steel Corporation until his death.

**GARY, HAMPSON** (1873- ). An American lawyer and diplomat, born at Tyler, Tex., and educated at the University of Virginia. In 1894 he was admitted to the bar and engaged in private practice and politics. In 1914 he became connected with the Department of State as a special war counsel. From 1917 to 1919, he was in Egypt as diplomatic agent and consul general, with the rank of minister resident. In 1919 he was in Paris with the American Commission to Negotiate Peace and in the following year was made Minister to Switzerland. After 1921 he practiced law in Washington, D. C.

**GAS**, See CHEMISTRY, Applied.

**GAS**, IN WARFARE. See CHEMICAL WARFARE, STRATEGY AND TACTICS.

**GAS**, NATURAL. See NATURAL GAS.

**GAS ENGINES**, See INTERNAL COMBUSTION ENGINES.

**GASES**. See CHEMISTRY.

**GASOLINE**. See CHEMISTRY, APPLIED; PETROLEUM; MOTOR VEHICLES; NATURAL GAS.

**GASPARRI, CARDINAL PIETRO** (1852- ). A Papal Secretary of State, born in Ussita, Italy. He was professor of canon law in the Catholic Institute in Paris (1880-86), apostolic delegate to Ecuador, Bolivia, and Peru (1898), and was made a Cardinal in 1907. He became Secretary of State in 1914 under Pope Benedict XV and was continued in that office by Pius XI. He negotiated with Premier Mussolini the treaty between the Vatican and the Italian government, ratified in 1929. See ITALY.

**GAS TURBINES**. See INTERNAL-COMBUSTION ENGINES.

**GAS WORKS**. See MUNICIPAL OWNERSHIP.

**GAULT, ROBERT HARVEY** (1874- ). An American psychologist, born at Ellsworth, Ohio, and educated at Cornell and Clark universities. He has been a member of the faculty of Northwestern University since 1909. In 1924-27 he was temporarily on leave with the National Research Council at Washington, D. C. Since 1927 he has been associated with the Carnegie Institution of Washington. In 1911 he became the editor of the *Journal of the American Institute of Criminal Law and Criminology*. After 1914 he also edited *Criminal Science Monographs*. He was part author and editor of the report of the Chicago Council for the Investigation of Crime (1915).

**GAUTHIER-VILLARS, GABRIELLE SIDONIE**. See COLETTE, MME.

**GAUTIER, götyä (CHARLES) LUCIEN** (1850-1924). A Swiss theologian (see VOL. IX), who was president of the Pastorale Suisse (1916-17), the Société Suisse des Vieux Zofingiens (1915-19), and the board of delegates of the South African Swiss Mission (1918-20).

In 1919 he became a member of the International Committee of the Red Cross. His later publications include *Le Prophète Jérémie* (1916), *Pflicht und Wille, devoir et volonté*, with Karl Scheurer (1916), and *Études sur la religion d'Israël*, edited by A. and L. Gautier (1927).

**GAUVAIN**, gö'vün', AUGUSTE (1861- ). A French editor and publicist, born at Vesoul, and educated in law at the University of Paris and the École des Sciences Politiques. He became in 1908 foreign editor of the powerful and conservative *Journal des Débats*. A member of the Academy of Moral and Political Science, Gauvain was a prolific writer on questions of current politics. The list of his writings includes *Les Origines de la guerre européenne* (1915), *L'Europe avant la guerre* (1917), *L'Affaire grecque* (1917), *La Question yougo slave* (1918), *L'Encerclement de l'Allemagne* (1919), and *L'Europe au Jour le Jour*, beginning with the Bosnian crisis of 1908-09 and including the treaties of 1919 (14 vols., six of which were crowned by the Institute, 1917-23). Gauvain also wrote Books I and III of the ninth volume of the *Histoire Contemporaine de France* and frequently contributed to the French periodical press.

**GAYLEY**, CHARLES MILLS (1858- ). An American author (see VOL. IX). He was dean of the faculties (1918-20) and co-administrator of the presidency (1919) of the University of California. He became research lecturer in 1921 and professor emeritus in 1923. Among his later works are *Shakespeare and the Founders of American Liberty* (1917), *The Gayley Anniversary Papers* (1922), and, in collaboration, *Lyric, Epic, and Allied Forms of Poetry* (1919).

**GAYLORD**, FRANKLIN AUGUSTUS (1856- ). An American clergyman and social worker, born at Yonkers, N. Y., and educated at Yale University, Union Theological Seminary, and the Collège de France. In 1887-93, he was general secretary of the Young Men's Christian Association at Paris, France. In 1894 he was ordained in the Presbyterian ministry. He was in St. Petersburg as general secretary of the Russian Y. M. C. A. (1899-1911), and in 1911 he was made director of the Russian Society for Moral and Physical Development of Young Men. In 1916 he was secretary of the American Hospital for Wounded Russian Soldiers, and in 1918-19, secretary of the International Committee of the Y. M. C. A., which he also represented in Odessa, Russia (1919-20), and other cities. He is the author of English translations of Russian verse.

**GEDDES**, géd'és, THE RT. HON. SIR AUCKLAND CAMPBELL (1870- ). A British scientist and diplomat, educated at Edinburgh University. He was professor of anatomy at Edinburgh, Dublin, and McGill University, Montreal, and principal of McGill University (1910-20). He served in the South African War, and in the World War until 1916, when he became Director of Recruiting. In 1917 he resigned to become Minister of National Service (until 1919), and he entered Parliament as a Unionist (1917-20). He was president of the Local Government Board (1918), Minister of Reconstruction (1919), president of the Board of Trade (1919-20), British Ambassador to the United States (1920-24), and chairman of the Royal Commission on Food Prices (1924-25). In 1922 he was made Knight of the Grand Cross of St. Michael and St. George.

**GEDDES**, THE RT. HON. SIR ERIC (CAMPBELL) (1875- ). A British politician, born in India and educated at Oxford Military College and Merchiston Castle School in Edinburgh. He first acquainted himself with railways in the United States (Baltimore & Ohio system) and in 1906 became manager of the Northeastern Railway Company in England. On the outbreak of the World War, he became Deputy Director General of munitions supply (1915-16), Director General of transportation on the staff of the Commander-in-Chief of the British Armies in France (1915-16), and Director General of military railroads and Inspector General of transportation in all the theatres of the War (1916-17). To him was credited the efficiency of British communication in France. From 1917-22 he was a Unionist member of Parliament for Cambridge. He was First Lord of the Admiralty (1917-18), a member of the Imperial War Cabinet (1918), Minister without Portfolio (1919), and Minister of Transport, a new position (1919-21). He proposed the reorganization bill for the railways in the spring of 1921. That August, the Chancellor of the Exchequer appointed him chairman of a committee to advise on all questions of national expenditure (1921-22). He was president of the Association of Trade Protection Societies of the United Kingdom (1923), and of the Federation of British Industries (1923-24). He was the head of various British tire and rubber industries, and Chairman of Imperial Airways, Limited.

**GEHRING**, JOHN GEORGE (1857- ). An American physician, neurologist, and psychiatrist, born in Cleveland, Ohio. He was graduated in medicine from the Western Reserve University in 1885 and after practicing for some years in Cleveland did post-graduate work in the University of Berlin (1891). Returning to the United States, he located in Bethel, Me., where since 1895 he has specialized in functional nervous and mental maladies, acquiring eminence in these fields. In 1923 he published *The Hope of the Variant*. In 1927 William Bingham II of Bethel, in recognition of the value of Dr. Gehring's work in psychiatry, gave \$200,000 to the psychiatric ward of the Neurological Institute of New York City.

**GEIKIE**, gē'kī, SIR ARCHIBALD (1835-1924). A British geologist (see VOL. IX). He was Governor of Harrow School (1892-1922). Among his later writings are *The Birds of Shakespeare* (1916), *Annals of the Royal Society Club in the Eighteenth and Nineteenth Centuries* (1917), *John Mitchell, M.A., F.R.S., of Queen's College, Cambridge, 1724-93* (1918), and *A Long Life's Work, an Autobiography* (1924).

**GELL**, WILLIAM EDGAR (?-1925). An American explorer and author, born at Doylestown, Pa., and educated at Lafayette College. He made journeys into Western Asia, China, and Africa, penetrating as far as Mt. Douglas, to study primitive races. He lectured on his observations in Australia, Japan, China, India, Great Britain, and the United States. In 1919-20 he explored the five sacred mountains of China. Among his works may be mentioned *The Great Wall of China* (1911) and *Adventures in the African Jungle Hunting Pygmies* (1917).

**GELERT**, gél'ért, GRETE MEISEL-HESS (1879-1922). An Austro-German writer, born at Prague. She spent five years at the University of Vienna in the study of philosophy, sociology,

and biology, and was also a pupil of Freud. Her reputation rests on her works on the sex problem, on woman, and marriage. They are *Die Sexuelle Krise* (1909), which has been translated into English; *Betrachtungen zur Frauenfrage* (1914); *Krieg und Ehe* (1916); *Das Wesen der Geschlechtlichkeit* (1916); *Die Bedeutung der Monogamie* (1917); and *Die Ehe als Erlebnis* (1919).

**GENETICS.** See **HEREDITY; ZOÖLOGY.**

**GENEVA.** (*French* Genève, *German* Genf). A city of Switzerland, the capital of the canton of Geneva (see **VOL. IX**), situated at the southwest extremity of the Lake of Geneva at the outlet of the Rhone River, which divides the city in two equal parts. The number of inhabitants was 125,520 according to the census of 1910; 135,059 by the census of 1920; the estimated population in 1925 was 126,000, and 134,350 in 1928. Of the inhabitants in 1920, 50 per cent were Protestants and 43 per cent Catholics; while 32 per cent were foreigners. Geneva is the third city of Switzerland, Zurich and Basel being larger. It is fast becoming an international city, being the seat of the League of Nations (first Assembly meeting on May 15, 1920), the International Red Cross, and the International Labor Office of the League of Nations. Many international meetings and conferences, such as that for the non-fortification and neutralization of the Åland Islands (1921), the Passport Conference (1926), or the International Economic Conference (1927), have taken place in Geneva. After Paris it is the most important centre of French intellectual life in the world.

In 1917 an imposing international Reformation Monument, projected in 1907, was finished; the architects were Swiss; Dubois, Lavarrière, Monod, and Taillens, and the sculptors French, Bouchard (q.v.) and Landowski. It is over 100 yards long, has high reliefs of the leaders of the Reformation and their political champions, and has reliefs of the chief events of the movement. From 1923 to 1925, a plain concrete four-storied building designed by Georges Epitoux of Lausanne, was built for the International Labor Office, close to the Botanic Gardens. In September, 1929, the cornerstone was laid of the new \$5,000,000 edifice that will house the League of Nations in Ariana Park. The dominating part of the structure will be the Assembly Hall, which will be connected on the left with the library and on the right with the council chamber and the Secretariat. The library is the gift of John D. Rockefeller, Jr., who donated an additional fund of \$1,000,000 for its maintenance. The plans are the composite work of five architects: Henri Nenot and Camille Lefèvre of Paris, Julien Flegenhimer of Geneva, and Professor Giuseppe Vago and Carlo Broggi of Rome. The League was formerly housed in the Salle de la Réformation and the old Hotel National on the Quai Woodrow Wilson.

**Bibliography.** *Catalogue de la Section des Archives de la Guerre*, published by the Bibliothèque publique et universitaire de Geneva (1919); *Geneva: Its Place in the World*, by Con-

stance and Julian Grande (1920); *Der Genfer Zonenstreit*, by Dr. Paul Köhler (1926); Baedeker's *Switzerland* (1928); the *Annual Report* of the Chamber of Commerce of Geneva; *Genève; cité des nations* (2 vols., published annually); and the annual *Compte rendu de l'administration de la Ville de Genève* published by the municipal council.

**GENEVA CONFERENCE.** The unsuccessful Geneva Conference for the limitation of naval armaments called by the President of the United States was held at Geneva, Switzerland, June 20-Aug. 4, 1927, with Great Britain, Japan, and the United States participating. France and Italy, who had refused invitations, were interested onlookers. The conference failed primarily because the United States and Great Britain could not agree on the size of cruisers they should build in completing the total cruiser tonnages tentatively arrived at. The Americans desired to build up a considerable portion of the allotted tonnage in 10,000 ton cruisers with 8-inch guns; the British wished to restrict cruiser construction almost entirely to ships of 7500 tons, and to construct a larger total tonnage than the Americans thought necessary. No great difference developed between the three powers with regard to the limitation of destroyers and submarines. The failure of the conference was followed by the adoption of an increased naval building programme by the United States Congress, designed to establish parity with Great Britain, and other evidences of a growing naval competition. Lord Robert Cecil, one of the British delegates at Geneva, resigned from the Conservative Government Aug. 27, 1927, in protest against its policy at the conference. The failure of the conference contributed to the overthrow of the Conservative government in the general election of 1929, the Labor Party having as one of its campaign pledges the elimination of the growing naval rivalry with the United States. See **WASHINGTON CONFERENCE.**

**GENOA**, jën'ô-ä. An important maritime centre of Italy. The population in 1926 was 333,320. By a decree of Jan. 14, 1926, greater Genoa was created, with a population of 541,582. It is the hope of Italy to make Genoa the largest port on the Mediterranean and the most important entrepôt for sea-borne traffic to and from central Europe. Since 1923 the port has undergone a considerable commercial development. Traffic increased from 6,300,712 tons of goods shipped in 1923 to 8,248,830 tons shipped in 1925. In 1927, 5103 vessels of 9,107,950 tonnage entered the port, and 5054 vessels of 9,011,057 tonnage were cleared. In 1923 the Italian government placed at the disposal of the local administration a sum of 310,000,000 lire to be expended for port improvements over a period of six years, terminating in 1929. These improvements include a new maritime station constructed at a cost of about 14,000,000 lire; a new drydock, 240 meters (787.4 feet) long and 32 meters (104.9 feet) wide, costing 32,000,000 lire; 800 meters (2624.6 feet) of quays added to the Vittorio Emanuele Dock; and a protective breakwater built of cyclopean masonry, the large concrete blocks weighing about 500 tons each. This work has been constructed for a length of 1450 meters (4757.2 feet), sufficient to shelter the basin adequately.

Further railway electrification has been accomplished in northern Italy, and the section between Genoa and Leghorn opened. From

Leghorn to Mondane on the frontier, the whole line has been electrified and is the longest stretch in Europe. An electric funicular railway between the districts of Borgoratti and Apparizione is to be constructed, the total length of the line being about 4500 meters (2.7 miles) with an average gradient of 22 per cent. Each car will accommodate 44 persons. On account of its location among high hills that reach down to the sea, Genoa requires several funicular railways and many elevators to insure easy and convenient transportation between the lower and upper levels of the city. In 1925 a civil air line was inaugurated between Palermo and Genoa.

The Piazza de Ferrari is the heart of Genoa's business district. On one side of the square are buildings of Old Genoa, the walls of palaces for the most part; on the opposite side is New Genoa, including the Bourse, the Post Office, and the Academy of Fine Arts. From the Piazza de Ferrari starts the most beautiful of modern thoroughfares in Genoa, the Via Venti Settembre, lined with fine modern palaces and substantial business buildings of recent construction. This main street leads to the Piazza Verdi where is the new Brignole Station and to the new city district beyond the Bisagno River. Near the Piazza de Ferrari is the house in which Columbus spent his boyhood and which has been converted into a historic shrine. When the tenements that flanked the house were torn down, the slender building could not safely be left standing. The three upper stories were removed, and the two lower ones were roofed over. In 1915 a monument was erected at Quarto dei Mille to mark the point of embarkation for Sicily in 1860 of Garibaldi and his 1000 volunteers.

**GEOGNOSY.** See GEOLOGY.

**GEOGRAPHICAL SOCIETY, AMERICAN.** A society established in 1852 for the dissemination of geographical information. From November, 1917, to December, 1918, it was the headquarters of a body of experts known as "The Inquiry," which studied conditions in Europe during the World War under the direction of the U. S. Department of State; later the director of the Society and some of these experts attended the Peace Conference where they served on various territorial and economic commissions. In 1919 the Society conducted a survey of the boundary between Guatemala and Honduras, at the requests of the governments concerned, to establish a basis for the recommendation of the Secretary of State of the United States for a final boundary in the disputed region. In the following year, the Society inaugurated a programme of research in the geography of Hispanic America; in 1925 the first of the publications devoted to this undertaking appeared under the title, *Map of Hispanic America Publications*; and by 1928 many of the maps of this series, on a scale of 1:1,000,000, to conform with the International Millionth Map of the World, were ready for distribution. The Society in 1921 assisted the Department of Justice in the study of the Red River Boundary in dispute between Oklahoma and Texas, and in the same year sent W. L. G. Joerg on a mission to Europe for the purpose of studying the status of geography in European universities and geographical institutions. In 1925 the numbers of the *Research*

*Series* of the Society dealt with the geographical lore of the time of the Crusades and with Bering's voyages. In 1926 there appeared two issues of the *Outing Series*; "A Trampers' Guide to the Palisades Interstate Park" and a "Trampers' Guide to the Vicinity of New York City"; as well as a volume on the physical geography of the Lesser Antilles, by Prof. W. M. Davis, and the first volume of another series, *Oriental Explorations and Studies*, which deals with the explorations of Prof. Alois Musil in the Northern Hedjaz, Arabia.

The *Geographical Review* (monthly, 1916-1921; quarterly, since 1921) superseded the *Bulletin of the American Geographical Society*, in 1916, as the official publication of the society. Valuable additions were made to the society's specialized geographical library throughout the years 1914-1929, and six regular lectures were delivered annually before the members and their guests by distinguished explorers or geographers. The Society recognizes contributions to the development of geographical science and exploration in its election to honorary and corresponding memberships and in the bestowal of medals. The President in 1928 was John H. Finley, LL.D., and the director, since 1915, has been Isaiah Bowman, Ph.D. The Society's building is at Broadway and 156th Street, New York City.

**GEOGRAPHIC SOCIETY, NATIONAL.** An organization founded in 1888 for the increase and diffusion of geographic knowledge. Among the most important of its recent activities were the six expeditions to Alaska, under Dr. Robert F. Griggs, which, in investigating the eruption of Mt. Katmai, discovered the new crater and the remarkable fumarole region described in *The Valley of Ten Thousand Smokes*, published in December 1922, as the final step in the Mt. Katmai research. Further volcanic studies were carried on in 1928 in the Pavlof volcano region off the Alaskan Peninsula; the expedition, under Dr. Thomas A. Jaggar, volcanist in charge of the work at Hawaii, accumulated information which will aid in forecasting eruptions; discovered evidence in favor of the continental drift theory; and found a new type of ice-ash jumble.

The chief archaeological work of the National Geographic Society was the excavation of Pueblo Bonito, at Chaco Canyon, New Mexico. During eight expeditions, under Dr. Neil M. Judd, the last in 1927, Pueblo Bonito was established as the most populous centre of early Indian culture north of the Rio Grande River. The civilization was divided into four periods, those of the basket makers, the pottery makers, the slab-house builders, and the apartment-house dwellers; the last-named leaving Pueblo Bonito, a building at least 1000 years old, which had 300 rooms on the first floor, and was probably about five stories high. By means of Dr. A. E. Douglass's discovery of the relation between tree-ring formations, and the 11-year sun-spot cycle, the duration of the entire Bonitian period has been approximated, and a calendar, covering the time between the old Spanish régime and the present, drawn; but in order to estimate the age of the Pueblo Bonito, the lapse between the two civilizations must be measured, and in 1929 Dr. Douglass was still working, with some success, to find beams or timber grown in the interval. Although discoveries made in 1925 enabled Dr. Judd to reconstruct the customs of the Bonitians, and to ascertain that there was no connection between the pre-Columbian Indian and the Egypt-

tian or any other early European civilization, it was found in 1926 that the same general method of irrigation was used in America as in the earliest known history of the Nile or the Euphrates. Other important archaeological work was accomplished under Dr. Byron Cummings in 1925, establishing a mound at Cuicuilco, Mexico, as the earliest known human habitation in the Western Hemisphere, dating back, according to Dr. N. H. Darton, over 4000 years, pre-Aztec and pre-Toltec.

An expedition valuable to several sciences was that under Donald B. MacMillan, who, with the coöperation of the U. S. Navy, explored North Greenland and Ellesmere Island in 1925. During that trip Richard E. Byrd, piloted by Floyd Bennett, commanded the first airplane flights across the North Pole. An extensive study of Arctic birds, fishes, flowers, and animals was made and Jacob Gayer obtained the first accurate colored photographs of the region. Useful facts were discovered concerning magnetic and tidal phenomena, and temperature and wind velocity in relation to aviation and weather forecasting. Again supporting polar research, the Society contributed \$25,000 in 1927 for the expedition to the Antarctic undertaken by Commander Byrd in the autumn of 1928.

A solar radiation station was established in 1926 at Mt. Brukkaros, South Africa, under the auspices of the National Geographic Society and the Smithsonian Institution, for the purpose of determining the relation between solar radiation and weather, which would make long-range weather forecasting possible. In the following year, it was shown that the fundamental cycles of the sun's radiation, 25½ months, and the known weather cycles of the past correspond, and that the prophecies of Dr. Dayton C. Miller's machine for analysis and synthesis of sun and weather curves have been closely fulfilled. The theory of the relationship was substantiated by further observations in 1928. It was also observed that there is a connection between static conditions and solar radiation.
